UNITED STATES INDUSTRIAL COMMISSION,
Washington, D. C., March 1, 1900.

SIR: In pursuance of an act of Congress approved June 18, 1898, I have the honor to transmit to you the Preliminary Report of the Industrial Commission, with accompanying documents.

I have the honor to transmit also a compilation of the laws of the United States and of the States and Territories affecting large industrial combinations, and the decisions under them, which has been prepared under the supervision of the Industrial Commission.

Respectfully,

JAMES H. KYLE,
Chairman.

THE SPEAKER OF THE HOUSE OF REPRESENTATIVES.

PRELIMINARY REPORT OF THE INDUSTRIAL COMMISSION.

To the Senate and House of Representatives, Fifty-sixth Congress:

The act of June 18, 1898, creating the Industrial Commission, authorizes it to "report from time to time to the Congress of the United States." As the subject of "Trusts," or Industrial Combinations, seemed to be one upon which there was pressing demand for trustworthy information, your Commission gave it early attention. Although we have examined sixty-two witnesses on trust topics, whose testimony is herewith submitted, our inquiry has been limited to eleven of the more prominent, but typical, combinations. This leaves quite a large field for further investigation, but the urgent demand for information leads us to submit what we have in hand at this time. As a result of our investigation of industrial combinations thus far, your Commission are of opinion that certain evils in connection with them should be checked by appropriate legislation. Experience proves that industrial combinations have become fixtures in our business life. Their power for evil should be destroyed and their means for good preserved. As a result of further investigation on our part, or of further development on the part of the combinations, it may be possible later to propose additional measures for relief without running the risk of increasing the evils. At present we propose the following, which, if severally adopted by the States, or so far as possible by the Federal Government, we are confident will be of great service and will not endanger business prosperity.

To prevent the organizers of corporations or industrial combinations from deceiving investors and the public, either through suppression of material facts or by making misleading statements, your Commission recommend:

(a) That the promoters and organizers of corporations or industrial combinations which look to the public to purchase or deal in their stocks or securities should be required to furnish full details regarding the organization, the property or services for which stocks or securities are to be issued, amount and kind of same, and all other material information necessary for safe and intelligent investment;

(b) That any prospectus or announcement of any kind soliciting subscriptions, which fails to make full disclosures as aforesaid, or which is false, should be deemed fraudulent, and the promoters, with their associates, held legally responsible;

(c) That the nature of the business of the corporation or industrial combination, all powers granted to directors and officers thereof, and all limitations upon them or upon the rights or powers of the members, should be required to be expressed in the certificate of incorporation, which instrument should be open to inspection by any investor.

The affairs of a corporation or industrial combination should be carried on, without detriment to the public, in the interest of its members, and under their lawful control. To this end the directors or trustees should be required:

(a) To report to the members thereof its financial condition in reasonable detail, verified by a competent auditor, at least once each year;

(b) To inform members regarding the method and conduct of business by granting them, under proper restrictions, access to records of directors' meetings, or otherwise;

(c) To provide for the use of members, before the annual meetings, lists of members, with their addresses and their several holdings; and

(d) To provide, in whatever other ways may be named in the certificate of incorporation, means whereby the members may prevent the misuse of their property by directors or trustees.

The larger corporations—the so-called trusts—should be required to publish annually a properly audited report, showing in reasonable detail their assets and liabilities, with profit or loss; such report and audit under oath to be subject to Government inspection. The purpose of such publicity is to encourage competition when profits become excessive, thus protecting consumers against too high prices and to guard the interests of employees by a knowledge of the financial condition of the business in which they are employed.

From the testimony given before the Commission, and herewith submitted, it has been proved that, before the passage of the Interstate Commerce Act, discriminating freight rates were frequently secured by large shippers. Other evidence herewith submitted, to be supplemented by additional testimony which will be laid before the Congress shortly, seems to show that like discriminating favors are even now granted. Believing that these discriminations clearly tend toward the control of business by large combinations, your Commission further recommend:

(a) That the Interstate Commerce Commission be given authority, not only to prescribe the methods of keeping accounts of the railroads and to demand reports in such detail as it may require, but also to inspect and audit said accounts;

(b) That the Interstate Commerce Law be so amended as to make the decisions of the Commission operative at a day fixed in the decisions and until reversed by the United States courts, on appeal;

(c) That the Interstate Commerce Commission be authorized to prescribe classifications of freight articles, and to make rules and regulations for freight transportation, throughout the United States; and

(d) That penalties for violations of the Interstate Commerce Act should be appropriate fines against the carrier, and not imprisonment of officials.

JAMES H. KYLE, *Chairman*.

BOIES PENROSE.

† ALBERT CLARKE.

* I concur in the recommendations of the commission on industrial combinations, but withhold my judgment on transportation corporations until testimony now being compiled by commission is submitted to Congress, with recommendations.

WM. LORIMER.

† I concur in all except paragraph marked (b), page 7. It seems to me better that rates fixed by Interstate Commerce Commission should not go into effect in case of appeal until affirmed by court, and that trial on appeal should be expedited.

ALBERT CLARKE.

REVIEW OF EVIDENCE.

INTRODUCTION.

The Industrial Commission has taken a mass of evidence regarding industrial combinations—facts regarding their organization and methods of work, opinions from all points of view regarding their effects, good and evil, upon business and society, and suggestions regarding legislation.

As, in the first instance, the most important task was to learn the facts regarding them, most of the witnesses summoned were either persons connected with the combinations—hence those inclined to see their favorable side—or their rivals, who were naturally led to see and speak of their evil aspects. An inevitable result has been that the evidence, even on questions of fact, has often been contradictory, and in some instances it has been impossible from the testimony so far taken to reach any positive conclusion. On the whole, however, a careful weighing of the evidence will lead to some conclusions regarding the nature of industrial combinations and their effects which seem fairly well justified. It should be kept clearly in mind through all the discussions that great capital or a great combination of capital has no necessary relation to monopoly, though it seems to be established that a virtual monopoly may at times be secured through the influence that comes merely from great capital.¹

COMPETITION THE CHIEF CAUSE.

Among the causes which have led to the formation of industrial combinations, most of the witnesses were of the opinion that competition, so vigorous that profits of nearly all competing establishments were destroyed, is to be given first place. Even Mr. Havemeyer said this, though, as he believed that in many cases the competition was brought about by the fact that the too high protective tariff had tempted many rivals into the field, he named the customs tariff law as the primal cause.² Many of the witnesses say that their organization was formed to make economies, to lessen competition and to get higher profits—another way of saying that competition is the cause without conceding that the separate plants were forced to combine.³ One or two witnesses simply mention the higher profits wanted or some like ambition, as when Chairman Gates asserts that the American Steel and Wire Company was formed because its organizers “wished to be the wire manufacturers of the world.”⁴

The methods by which the combinations hope to effect savings so as to keep new competitors from coming into the field will be mentioned under the advantages of combination, but it may be noted that they usually assert that they expect the increased profits to come from savings and lessened cost of production, and not from higher prices.

THE FORM OF ORGANIZATION.

While the form of organization of the industrial combinations is not of so great importance, perhaps, as their effects upon prices and wages and society at large, it is nevertheless of consequence to see what legal form has been taken by those that from the point of view of their managers are most successful, especially if an effort is to be made to legislate regarding them.

The form of organization that has given them their name "trusts" was the one started by the Standard Oil Trust in 1882, afterwards followed by the Whisky combination—the Distillers and Cattle Feeders' Trust—and by the Sugar Trust—the American Sugar Refineries Company. The plan of that organization was as follows: The stockholders of the different corporations entering the combination assigned their stock in trust to a board of trustees without the power of revocation. That board of trustees then held the voting power of the stocks of the different companies, and was thus enabled, through the election of directors, to control them absolutely. In place of the stock thus received the trustees issued trust certificates upon which the former holders of the stock drew their dividends, these being paid upon the certificates regardless of what disposition was made of the plants of the different corporations. Owing largely to hostile legislation and to the bitter feeling against the trusts above named, these trusts, after some adverse decisions of the courts, went out of existence, reorganizing as single corporations in most cases, and none at the present time remain.

A somewhat similar form of organization, however—the voting trust—is found at times. In this form of trust the holders of at least a majority of stock of a single corporation put their stock into the hands of trustees for the purpose of voting it, retaining for themselves all the privileges of drawing dividends and making transfers. Such a voting trust has been formed, it is claimed, in the case of the Pure Oil Company—an organization of the independent oil interests—for the sake of protecting a majority of the stock against purchase by the Standard Oil Company. The Standard had bought large blocks of stock before in another independent company with the probable purpose of securing control. It will be observed that the purpose of such a trust is not to unite various corporations under one management, but to secure in perpetuity an agreed-upon policy without danger of interference through sales of individual shareholders.¹ Some profess to find danger in this form of voting trust, while others think it decidedly beneficial. It is, however, true that this form of trust may put the direction of a company into the hands of a comparatively few members, the trustees, who are in this way able to manage the affairs of the company and to secure it a permanent policy (whatever later wishes of stockholders may be) such as could not be secured under the ordinary corporate management with so great certainty.² At any rate, as a form of corporate combination for the sake of securing monopolistic control, the voting trust does not seem to be now in vogue.

The form of organization that seems most common at the present time is that of the single large corporation, which owns outright the different plants. A combination of this kind is formed by the purchase of all of the plants of the different corporations or individuals who enter into it, the corporations then dissolving as separate corporations. Often payments for the plants are made largely in stock of the new corporation, so that many of the former owners maintain their interest in the business. The affairs are then managed entirely by the stockholders of the one corporation through their board of directors, elected in the ordinary way. It is usual for these larger corporations to choose a very liberal form of charter.

A third form of organization, which is in many particulars quite like the original trust form, is that which has been taken by the Federal Steel Company, by the Dis-

¹ Phillips, pp. 581-598; Boyle, pp. 464-466; Archbold, pp. 508-513; Emery, pp. 657, 658.

² Dos Passos, p. 1174; Myers, p. 1181.

tilling Company of America, and others. In this form the central company, instead of purchasing the plants of the different corporations which it is proposed to unite, simply buys a majority of the stock, or possibly the entire stock of each one of the corporations. The separate corporations keep in separate corporate existence, but a majority of the stock being held by the one larger corporation, its officers, of course, elect the boards of directors of all of the separate corporations, and in this way hold ultimately complete control. It is usually true that the separate corporations manage their own affairs practically independently, although they are furnished information regarding the workings of the other establishments in the combination through the central officers, and are doubtless largely directed in their policy in this way.¹

In the case of the Standard Oil Company, when the original trust was dissolved, there were issued to the holders of trust certificates proportional amounts of stocks of each of the constituent companies, and since the trustees themselves had held a majority of the certificates, they retained as individuals a majority of the stock in each one of the companies that had formerly been in the trust. The separate corporations were named as separate corporations, but the majority of the stock of all being held in the same hands, the directors of the different companies were largely the same men, and their affairs were managed in unison in substantially the same way as had been the case before. The new Standard Oil Company of New Jersey has recently been formed with the intention of transferring the stocks of the different corporations into the stock of the new company, so that when the transfer has been finally made, one single corporation, the Standard Oil Company of New Jersey, will own outright the property now owned by the separate companies which are commonly known and mentioned together under the name of the Standard Oil Company. This combination at present has no formal unity. It has a practical unity as great as it will have probably after the complete change into the New Jersey company is effected.²

As most of the larger corporations have, within the last few years, been organized in New Jersey, it will be worth while to note the special advantages given by the corporation laws of that State.³ The advantages that seem to be brought out most clearly are:

First, taxation. The organization tax is considerably lower than that of most of the States, while the annual tax is fixed upon the amount of capital paid in, so that it is an absolutely certain quantity and can be determined by anyone, thus leaving no opportunity for corruption on the part of either the corporation itself or of State officials. The rate of the tax is moderate, and decreases as the amount of capital increases.

Second. Perhaps a greater advantage is to be found in the liberal form of the New Jersey charter. The amount of capital is unlimited, the period of organization is unlimited, the amount of indebtedness is not limited, the powers that are granted to corporations are also practically unlimited, with the exception that an ordinary business corporation is forbidden to engage in banking. The Federal Steel Company would have found it impossible to organize for the purpose of engaging in the various enterprises which it has undertaken had it incorporated in the State of Illinois or of Pennsylvania.⁴ The same thing holds also with reference to the American Steel and Wire Company.⁵

Third. There is less liability on the part of the stockholders than in several other States.⁶

Fourth. The directors have also less liability. In case of issuance of stock for property the judgment of the directors is conclusive as to the value of the property taken,

12 THE INDUSTRIAL COMMISSION:—INDUSTRIAL COMBINATIONS.

unless there is evidence of fraud. Stock issued thus for property is considered fully paid up, and the stockholders can not be held further liable in case the property proves to have been taken at less than its cash value. The directors are not personally liable for the debts of the corporation if they fail to file reports or to conform with certain other requirements.

On the other hand, some of the witnesses, notably Mr. Dill, called attention to the somewhat rigid provisions of the New Jersey corporation law regarding the making of reports and the keeping of a registered office in the State, where could be learned the leading facts regarding the corporation. It is the purpose of the registration companies, which act as representatives of most of the large corporations organized in the State, to secure the filing of the annual reports and to have the stock and transfer books of the corporation always kept up to date and accessible to stockholders who may wish to find out who their fellow-stockholders are and the extent of their holdings. It was, however, brought out in the evidence that these provisions with reference to registration offices are not fully carried out in practice by the attorneys and others who act as agents usually of the smaller corporations, while there are violations of the law probably in the case of a large majority of the small corporations as regards the filing of the annual reports.¹

The laws of Delaware and West Virginia were also explained at considerable length. They are even more liberal in some particulars, especially as regards taxation, than those of New Jersey. Neither of these States requires that shareholders' meetings be held within the State, while West Virginia does not even require a permanent office to be kept in the State, although it does insist upon the payment of an annual fee, and limits the capitalization to \$5,000,000.²

OVERCAPITALIZATION.

GENERAL STATEMENTS REGARDING THE EVIL.

During the past few years the total capitalization of the new industrial combinations has reached an enormous sum, well into the billions, and in many cases at least the nominal capitalization of the corporations far exceeds the cash value of their property. The impressions among different people regarding the effect of this overcapitalization vary. Some of the witnesses who have appeared before the Commission are of the opinion that the question of the capitalization of any corporation is of slight consequence. They think that if the amount of stock issued is only three or four times in par value more than the cash value of the plants themselves, no especial harm is done. If the plant shows that its earning capacity is sufficient to pay dividends on the large capitalization, the stock will hold its value fairly well, and the capitalization is justified. If the earning capacity of the establishment is not sufficient to pay dividends, this condition will show itself in the value of the stocks. While some individuals who are careless about their methods of doing business may be injured by the purchase of stock through misrepresentation, that is not a matter that concerns materially the general public. People who deal in stocks are likely at times to lose. The State, it is said, can not act as guardian for foolish individuals. It is not believed by these witnesses that overcapitalization has any effect upon prices which is injurious to the public.³

Other witnesses believe that this overcapitalization is a serious injury to the public. Not merely do the misrepresentations of the promoters of these corporations, and perhaps also of the underwriters of their stocks, mislead prospective buyers of stock, but it is thought also that the attempt to pay dividends on the inflated capitalization

¹ Dill, pp. 1079, 1080; officers of registration agencies, pp. 1089-1099; Ryan, pp. 1099-1106; Edgerton, pp. 1123-1125.

seriously affects the prices of the products to consumers and the wages of employees. These witnesses are inclined to believe that possibly the chief evil of the great industrial combinations comes at the time of their organization, when private bankers and others acting as financial agents or underwriters, together with promoters, make huge profits from floating the new corporations, which will afterwards find themselves unable to pay dividends to stockholders and which must within a comparatively short time go through a process of reorganization to the great loss of those who have invested their money in good faith. Some of the witnesses are inclined to think that this overcapitalization has been so prevalent within the past two or three years that the result must inevitably be a financial crisis which will prove injurious to the public at large, aside from those who have foolishly, perhaps, invested their money in these stocks.¹

The position seems well taken that the methods of promotion and financiering are often decidedly against public interest and ought to be checked. The overcapitalization, too, is probably felt somewhat in increased prices at times.

THE FACTS FROM THE TESTIMONY.

1. *Capitalization.*—Regarding most of the combinations concerning which testimony has been taken the facts appear quite clear.

None of the witnesses believe that the Standard Oil Company is on the whole overcapitalized, as compared with the present value of the plants. Its opponents believe that its profits are enormous on the capitalization.² The witnesses representing the Standard Oil Company itself, while admitting very large profits and presenting no very definite facts regarding the capitalization, still give the same impression from their testimony.³

The American Sugar Refining Company seems to be, beyond question, capitalized at a sum twice as large at least as the cost of reconstruction of the plants themselves. The capitalization was shown to be several times the original capitalization of its constituent members, the testimony taken before the Lexow Committee on this point being confirmed in terms, although the capitalization of some of these constituent members had little relation to their actual value.⁴ Much more direct was the testimony regarding the present capitalization as compared with the present cost of reproducing the plants. The present capacity of the American Sugar Refining Company is substantially 40,000 barrels per day. On the basis of estimates given by Mr. Doscher,⁵ Mr. Jarvie,⁶ Mr. Post,⁷ and Mr. Havemeyer,⁸ these refineries could be built at a cost of from twenty to thirty-five millions, it being conceded by them all that the present cost of building (June, 1899) is very much higher than it would have been a little earlier. This sum would show that a capitalization of probably not over half the present one (\$75,000,000) would be ample to handle the business satisfactorily. Mr. Havemeyer, however, contends that the value of the brands owned by the American Sugar Refining Company and the good will must not be overlooked. The Havemeyer and Elder brand especially is in itself, he thinks, worth thirty-five or forty millions, and is at least equal in value to the plants.⁹ The dividends by the American Sugar Refining Company for some years past, 7 per cent on the preferred stock and 12 per cent on the common, together with the sum set aside for surplus, would seem to show that, while the capitalization may be far above the cost of the plants, it is not above the earning capacity of the establishments at the range of prices which has prevailed for the past few years. This raises the question whether the power of the combination has not enabled it to keep prices up so that

14 THE INDUSTRIAL COMMISSION:—INDUSTRIAL COMBINATIONS.

its earnings could pay dividends on an excessive capitalization, and whether the high capitalization has not been an added temptation to hold prices high.

According to the testimony of several witnesses, the first stable whisky combination, the Distillers and Cattle Feeders' Trust, was capitalized at an amount far beyond the cash values of its plants. The clearest testimony on this subject was given by Mr. Clarke,¹ who asserted that he was paid in trust certificates four times the agreed-upon fair cash value of his plant. He believes that other distillers who went into the combination were paid on substantially the same basis. Probably some of the more influential trustees secured even more than the other members.² The trust certificates received dividends of 6 per cent per annum for some years. On the basis, also, of late offers which were made him for the plant of which he was in control, Mr. Clarke believes that the Standard Distilling and Distributing Company was capitalized at probably six times the actual cash value of the plants.³ Other witnesses, while not giving testimony in such definite figures, nevertheless confirm the fact of large overcapitalization of the whisky combinations.⁴ In fact, the testimony of Mr. Cook⁵ would tend to show that the present capacity of the new whisky combination could be reproduced at but a small fraction of the present capitalization.

Perhaps the clearest testimony on this subject of capitalization came from the witnesses connected with some of the iron and steel companies. The witnesses regarding the tin-plate combination were in substantial agreement in stating that the owners of most of the plants gave an option on their plants at what they considered was the fair cash value, although, owing to the good times and to the fact that, in many cases, the industries were quite prosperous, the prices were high. They were then given, by the promoter, the option of taking this valuation of their property in cash, or of taking instead the same amount in preferred stock with a like amount of common stock added as bonus. The witnesses who appeared before the Commission had chosen to take stock instead of cash, believing that the business could carry that capitalization, and the price of stock on the market shows that the common and preferred together have so far ranged above the cash valuation.

One of the witnesses, at least, conceded that the total amount of stock thus paid for the plants, since the cash option was taken in prosperous times and included not merely the value of the plant but also the good will of the running business, probably amounted in some instances to three or four or even five times the cash cost of the plants at that time. Owing, however, to the greatly increased value of material and the increased wages of labor, some of the witnesses were of the opinion that the preferred stock alone of the tin-plate company would probably not equal the cost of reproduction of its plants at the present time.⁶

Exactly the same system seems to have been followed in the capitalization of the National Biscuit Company,⁷ the National Steel Company,⁸ and the American Steel Hoop Company.⁹ In all these cases there was a clear understanding that the common stock represented simply bonus or anticipated profits. The fact that the cash options taken on the plants included also in the minds of the sellers the good will, and were presumably at a fairly high price, considering the prosperous times and the added advantage which was expected to be obtained from the combination itself, would seem to show that the capitalization, including both preferred and common stock, was considerably more than double the cost of reproducing the plants themselves.

In the case of the American Tin Plate Company there was also added ten millions of common stock, which was issued to the promoter for his services and for the cost of organization. It is presumed, of course, that not a little of this ten millions had to

be paid out in commissions, etc., to those who aided in securing the required amount of capital, including cash furnished for working capital.¹ The amount of extra common stock issued for purposes of promotion in the American Steel Hoop Company and in the National Steel Company was \$5,000,000 in each case.

In all these cases the capital seems not to have been beyond the earning capacity during the prosperous times of the last year, the question again arising as to whether the prices have been pushed beyond normal rates in order to pay dividends on watered stock.

The International Silver Company, according to the testimony of its president, has from 45 to 50 per cent of its capitalization represented by plants, machinery, merchandise, etc., and the rest by brands or "good will."²

Mr. Gates, president of the American Steel and Wire Company, estimates that of their \$80,000,000 of capital stock, some \$10,000,000 to \$15,000,000 are considered good will, the rest plants and material.³ It is to be noted, however, that the valuation of the plants given by Mr. Gates is based on the great increase in cost of all iron material for the last year, and not on the value at the time the organization was capitalized. Forty million dollars would come more nearly the cash value at the time, 1897-98, when Mr. Morgan's estimate was made of \$28,000,000 for some 70 per cent of the value of all the plants.

The National Shear Company was clearly capitalized at far beyond its cash value. Mr. Wiss was of the opinion that the stock issued was five times more than the cash value of the plants; and the fact that the stock was practically unsalable would seem to justify his conclusion, even though there were difficulties in connection with the management of the establishments which would tend to lower the value of the stock.⁴

2. *Promoters' profits.*—As was intimated above,⁵ one of the chief causes of this over-capitalization comes from the high profits that are secured by the promoters and by the underwriters of the stock when the combinations are made. Mention has just been made of the ten millions of common stock paid to the promoter of the American Tin Plate Company, and of the five millions paid in each case to the promoter of the National Steel Company and of the American Steel Hoop Company.

According to the testimony of Mr. Clarke,⁶ when the Standard Distilling and Distributing Company was organized, for each \$100,000 of cash advanced to buy the plants the underwriters received \$100,000 in preferred stock and \$150,000 in common stock, while the promoter likewise received \$150,000 in common stock.

According to the agreement made with the organizers of the Distilling Company of America, they were to turn over all the stock of the constituent companies at a ratio agreed upon, and were then to furnish \$1,500,000 cash as working capital and two distilleries which, it was testified, cost \$2,000,000. After full exchange in stock at the agreed ratios was made, there would be left in their hands, with which to secure the \$3,500,000 cash needed, \$10,710,000 of preferred stock and \$13,360,000 of common. At the average market price of the stocks during the month after the company was organized, July, 1897, 56½ and 21, respectively, these stocks would have been worth \$8,856,750, although, of course, they would not have realized this if thrown on the market. Promoters' profits seemed thus very large. By December, however, the stock had so fallen that it was worth less than \$4,000,000; so that the ultimate gains were possibly not so large as they at first appeared.

Mr. Pearson, who acted as banker for the National Shear Company, testified⁷ that he was to receive \$30,000 in preferred stock and \$225,000 in common stock for discounting the notes of the company to the amount of \$200,000 and continuing this rediscounting for a period of 18 months. In case he withdrew from his bargain

³ Page 1021.

after 9 months, he was to receive a little less than half. Being dissatisfied with the way the company was doing business, at the end of 9 months he withdrew from this arrangement. The stock due to him in accordance with the contract had not yet been paid when he testified. This combination seems practically to have been organized on borrowed money, even in part for payments for plants. The liberality of the organization with the banker was clearly brought out. The profits of the promoters did not appear from the testimony.

According to the testimony of Mr. Gary¹ the Federal Steel Company was capitalized at almost precisely the actual value of the plants, estimated by a board of appraisers, together with the actual cash put in. Considerable has been allowed for increased values of lands, and, of course, the exact basis of the appraisal did not appear. He testified also that J. P. Morgan & Co., the bankers who effected the exchange of the stocks of the constituent companies for that of the Federal Steel Company, received some \$200,000 for their services. He admitted, however, that before this arrangement was made by J. P. Morgan & Co. for the syndicate that was organizing the Federal Steel Company, J. P. Morgan & Co. already controlled a majority of the stock of all the constituent companies. The price paid by them for this stock did not appear, so that their real profits are not clearly in evidence.²

On the whole, from the testimony given before the Commission, the inference seems a fair one that the capitalization of these combinations is usually a sum considerably above the value of the plants together with patents, but exclusive of brands and good will, of the companies that enter into the combination. In cases that are considered fairly conservative, the amount of stock issued, including both preferred and common stock, is from two to three times more than this value, while in not a few instances—for example, the one cited by Mr. Dill³ where value of possibly \$500,000 was capitalized for \$8,000,000—the capital stock seems to bear little relation to actual value of plants and patents.

PRICES.

RAW MATERIAL.

The statement is frequently made that owing to the fact that a large combination becomes a principal buyer of raw material it has great influence in decreasing its price. Thus it is said that, as the chief purchaser of raw sugar, the American Sugar Refining Company is able to get a certain advantage.⁴ Mr. Havemeyer concedes that the fact that he is a very large buyer gives him some advantage in selecting his markets.⁵ All seem to be agreed, however, that this advantage probably does not on the average amount to more than one-sixteenth of a cent per pound.

In the case of the American Tin Plate Company it was said that owing to the fact it was a very large buyer of steel it could at times get contracts at better rates than smaller buyers, although apparently it could not get any better rates than several other large buyers of steel doing different classes of business. Especially, however, does the fact that the directors of the American Tin Plate Company are in large part the same as the directors of the National Steel Company, that the business conditions of each are known to the other, and that their interests are closely allied, enable the Tin Plate Company at times to secure rather better rates from the National Steel Company than would be given by that company to an outsider. Similar statements are made regarding the American Steel Hoop Company, which is similarly associated with the National Steel Company.⁶

Nearly all of the opponents of the Standard Oil Company who appeared before the commission testified that owing to the fact that the Standard had control of the main

pipe lines and was the chief refiner of petroleum it could practically fix the price of crude oil, and had done so for many years, often to the detriment or even financial ruin of the producer.¹ By virtue of its control over the pipe lines the Standard Oil Company, when in competition with smaller pipe lines in certain localities, had frequently put premiums upon the oil produced there, thus paying more than the regular market rate for it. Sometimes through this practice the competing pipe lines found themselves deprived of oil, were financially ruined, and were at length bought up by the Standard Oil Company, which then recouped itself by removing the premium, and perhaps making a general reduction in the price of crude oil.² The opponents of the Standard Oil Company seem to be of the opinion that this payment of premiums has been almost altogether for the sake of forcing the competitors out of the business. The Standard Oil witnesses, on the other hand, asserted that the premiums were often, perhaps usually, and at present only, made because of the better quality of the oil from these special localities; but they also conceded that at times the Standard has paid premiums for the sake of forcing a competitor out of the business, and that under similar circumstances it would do it again.³

It is charged also that where the Standard Oil Company has had exclusive control of the pipe lines in certain territory it has frequently held the price of crude oil so low that it could at length buy up the wells or the oil lands from the producers and owners, after which the price of crude oil would be raised again to a fair price.⁴ There can be little doubt that when a company is the owner of the only pipe line in any district, this gives it great control over the price of oil, and in consequence over the welfare of the producers themselves.

Owing to this control (which seems to be in the main conceded by the witnesses on behalf of the Standard Oil Company), some of the witnesses assert that the tables and charts of prices of crude and export refined oil, which show also the ratios or margins between them, misrepresent in many cases the real state of the business. If the prices of crude oil are fixed arbitrarily for the purposes of buying up oil territory, of buying out competing pipe lines, or of raising the cost to independent refiners, or if losses on refined export oil are recouped by raising the price of American refined, such figures can hardly be an indication of the real condition of the business.⁵ On the other hand, the testimony of Mr. Lee in explaining the course of prices of crude oil over a series of years seems to show that he also believes that the amount of the output has, in spite of many arbitrary acts of the Standard, in the long run and on the whole been certainly a very important if not the chief cause in determining its variations in price.⁶

It is asserted by the Standard Oil Company itself that its prices for crude petroleum, as of late years announced through the Seep Purchasing Agency, are fixed on the world demand and supply, and that in the main these prices have been fair to the producers.⁷ It is probably true in general that the extent of the output has been the main factor in determining prices, though the fact of very many individual cases of arbitrary shifting of prices to a degree ruinous, in certain localities, to the competitors and to the producers, may also be considered established.

PRICES OF PRODUCT.

1. *Control of output.*—Several of the combinations, as appears from the testimony of their officers, control a large proportion of the entire output of the country. The American Sugar Refining Company was selling at the time of the testimony about 90

18 THE INDUSTRIAL COMMISSION:—INDUSTRIAL COMBINATIONS.

per cent of the output.¹ The American Tin Plate Company was probably also, at the time when its representatives appeared, controlling something more than 90 per cent.² The whisky combination has controlled at times as high as 95 per cent of the production of spirits, and has probably during most of the time for the past 12 years controlled more than 80 per cent of the output.³ Most of the iron and steel companies claim, on the other hand, that they make no attempt to control so large a percentage of the output, and that they make no approach to monopolistic power, but secure their advantages by bringing together different branches of the industry which insures them a steady supply of raw material or, on the other hand, a sure customer for part of the product. Thus the Federal Steel Company controls possibly some 30 per cent of the output of its main products, and carries the processes from the mines to the finished product. The National Steel Company controls about 18 per cent, and it also operates mines, fleets, and mills.⁴ In the case of the American Steel and Wire Company, however, the combination at the time of the testimony was selling from 75 to 80 per cent of the total output of steel rods, the same percentage of smooth wire, and 65 to 90 per cent of wire nails. Moreover, the American Steel and Wire Company has practically a monopoly of barbed-wire and woven-wire fencing through the patents which it holds, and not merely by virtue of its large capital. With the exception of the monopoly secured through these patents Mr. Gates, chairman of the company, thinks it does not control competition.⁵

The proportion of refined petroleum produced by the Standard Oil Company has varied materially at different times, but during the past few years has, as stated by its own officers, increased gradually from 81.4 per cent in 1894 to 83.7 per cent in 1898.⁶ Opponents of the combination are inclined to put the figures as high as 90 or 95 per cent.⁷ The control of the crude petroleum field by the combination is much less, but is, nevertheless, considerable. It is not claimed, however, that the Standard fixes the price of crude petroleum by virtue of the fact that it is the greatest producer, but rather by the fact that it owns the pipe lines and is the chief buyer.

2. *Control of prices.*—A manufacturer who controls so large a proportion of the product as do some of these combinations can, beyond question, to a considerable degree control the price.⁸ Throwing into the market a large amount of goods at one time tends to lower the price. Likewise, one who controls plants enough to supply the entire normal demand of the country can, evidently, by closing some of these plants, readily raise the price.

The custom has regularly been for some years for the Standard Oil Company to announce from day to day the price which it would pay for crude petroleum and the price at which it would sell refined petroleum. This price is generally accepted as the market price, and competitors follow.

Likewise, the American Sugar Refining Company first posts the prices for the day, and is then followed by its competitors, who post theirs. Generally they take the prices fixed by the American Sugar Refining Company; but at times, if they have a little surplus stock on hand, or if it is difficult for them to secure a customer, they will cut the price perhaps one-sixteenth of a cent per pound. One or two of the chief competitors seem to be forced to put their prices quite frequently at one-sixteenth of a cent below that of the American Sugar Refining Company.⁹ In spite of its control over the output it is said by Mr. Post that the American Sugar Refining Company has not, in his judgment, unduly restricted the output.¹⁰ It is probable, he thinks, that had that company not been formed the competitive system would have ruined many

established refineries, so that as many would have been closed as is now the case and the output would have been fully as small, probably even less. Practically all of the witnesses, both members of the combination and their opponents, concede that while there is a certain arbitrariness in fixing the prices it has been exercised in most cases only within comparatively narrow limits, and then mainly to meet competition or stifle it.

While prices may be kept at rates sufficient, by virtue of the economies of combination, to pay reasonable, even considerable, profits, though still largely excluding competition, any attempt, it is claimed by many witnesses, to secure extortionate prices defeats itself by provoking competition. Thus the whisky combination, in the days of the Distillers and Cattle Feeders' Trust and the Distilling and Cattle Feeding Company, in certain instances put up the prices to an excessively high point. The result was that numerous competitive distilleries were built, so that either the trust was forced to buy them out at high figures or else the competitors secured enough control of the market so that the prices were comparatively soon forced down.¹

It seems to be conceded by all parties that the whisky combination might, if it would adopt that policy, hold its prices at profitable rates, and at the same time so low that no one would care to compete, its present leading competitors being willing to buy whatever product they need for compounding purposes from the trust at a fixed price based upon that of corn.²

The officials of the American Tin Plate Company recognize that their price is to be considered the American price, although they, with all of the other representatives of combinations, deny that they possess a monopoly, and show that there are some competitors in the field. The company fixes the price, which its competitors in the main follow, but its officers realize that if they push their profits too high they will simply call in competitors to so great an extent that it will hurt their own business and prevent their control of the conditions. The same argument is presented in general terms by several witnesses regarding the control over prices by the combinations.³

In some cases, notably in the iron and steel and allied industries, there has been within the last year or two an almost marvelous increase in the demand for products of all kinds. In consequence, prices have advanced very rapidly. While it is probably true that the combinations have been able to seize the advantages of the situation better than could smaller manufacturers, there can be no doubt that the main increase in price has come from the most unusual demand. Mr. Gates testified⁴ that in his judgment the new output of steel cars, steel vessels, and steel frames for buildings and bridges constituted as large a tonnage as the total tonnage of the United States in iron and steel fifteen or twenty years ago. All the witnesses in those lines seemed to agree as to the increase in demand and as to the fact that it, with the corresponding increase in price of basic materials, was the chief cause of the increase in price of finished product. Hardly any of the companies could meet present demand and all were taking contracts for months ahead.

The fact, however, that in the main the great combinations fix the prices and their competitors follow would seem to show a certain element of monopoly. When they make a cut in the price the others must follow, and their action is substantially an arbitrary one. They, on the other hand, having so large a control of the market, need not follow the cut of a competitor in a comparatively small market, although, of course, they can not permit the competitor to widen his market materially, provided they wish to hold the control. So, on the other hand, this monopolistic element is

¹ McNulta, p. 217; Clarke, pp. 171, 176; Cook, pp. 241-246; Bradley, pp. 814, 815.

⁴ Page 1028.

⁵ Gates, p. 1027; Reid, p. 881; Reis, pp. 945, 950.

shown by the fact that the increased price fixed at any time by a combination must be taken, at least temporarily, by most consumers, since the combination is, substantially, at the moment the chief source of supply, its competitors being utterly unable to meet the needs of the market. This is true in spite of the fact that if the prices are made unreasonably high, competitors would, in the long run, deprive the combination of its trade.

The success of great combinations as chief manufacturers depends, their officers claim, upon a cheaper cost of production than that which their competitors possess. If they can not effect this, the witnesses maintain that the combinations will comparatively soon lose their control, unless they can succeed in bringing some other element, like a patent, into the problem.¹ On the other hand, it has been conceded by one or two of the witnesses that the fact merely that the combinations possess so large a capital and can exert so much power tends to frighten their actual or would-be competitors, and this enables them to secure or keep a certain element of monopolistic control, aside from the greater cheapness of production which they may or may not possess. Of course, this latter monopolistic element, depending upon the deterrent effect which their power exerts upon their competitors, is, these witnesses claim, comparatively slight.²

A more accurate discussion of the course of prices in these special lines can be made from a study of the charts appended. The figures in these charts are in every case conceded by the managers of the combinations to be as nearly accurate as any that can be secured.

3. *Cuts in local markets.*—From the standpoint of the competitors of the combinations, the greatest evil perhaps is not the fixing of prices too high, although assertions against the monopolies are not infrequently made on this ground, but rather that they cut prices to an unreasonable extent in certain localities, and even to individuals at certain times for the sake of driving out their rivals. This practice has been most frequently charged against the Standard Oil Company. Doubtless, too, in order to get into new fields, the competitors will at times cut the price, and to hold its market the Standard follows, or makes still lower prices; or again, to prevent a competitor from entering a market which he seems to be threatening, a first cut is made by the Standard. Witnesses disagree as to the side which usually makes the first cut, and doubtless all depends upon the circumstances of the special case in question.³ The same policy has also been followed by the American Sugar Refining Company, at any rate in its earlier days, and of late since it has been competing against the new refineries of Arbuckle Brothers and Doscher.⁴

The opponents of the Standard Oil Company do not hesitate to charge it with employing competitive methods which they consider dishonorable. They assert that persons are engaged to follow wagons of competitors to learn who their customers are, and that then they make lower offers to those customers; and it is still further asserted that at times the employees in the offices of rivals are bribed to disclose the business to the Standard Oil Company.⁵

The Standard Oil Company denies authorizing or approving any such methods of learning its competitors' business, although it is acknowledged that it takes practically every honorable means of finding out what its competitors are doing in order that it may properly meet the competitors on their own field.⁶ The methods of competition charged, it is said, may rarely be followed by an overzealous employee, but such action would be discountenanced in every case by the company.

⁶ Mathews, p. 505; Archbold, p. 573.

THE FACTOR SYSTEM.

Several of the industrial combinations have adopted the plan of selling their goods to wholesalers at a certain fixed price and at the same time naming a price at which they were to furnish them to the retailers. After an interval of from thirty days to six months, provided the wholesaler would make affidavit that he had maintained the prices given him, and, sometimes, that he had sold only the goods of the combination, he would receive a rebate from the manufacturer. From this rebate came his only profits. It has been thought by many that this factor system was a means employed by the combination to hold its monopolistic control over the wholesaler.

In the case of the sugar combination, however, the testimony seems to show that competition among the wholesalers had resulted in depriving them of any profits whatever, and had even, in many cases, forced them to sell at a loss. In order to avoid this difficulty the wholesalers themselves petitioned the American Sugar Refining Company to adopt the factor plan, and after a consideration of the matter, as an accommodation to the wholesaler, the plan was adopted. The sugar refining company itself claims that it receives no advantage from the system, but adopted it only at the request of the wholesalers. The other refineries have likewise adopted the same system.¹ Mr. G. Waldo Smith, president of the American Grocers' Association, explained the system in detail and told how important it was to the grocers. He is strongly in favor of it, not merely as applied to sugar, but to any product which is uniform in quality, so that special brands have little influence in fixing the prices, and has himself proposed plans for its more general adoption. He believes that this is the wisest method for grocers and one that is perfectly legitimate; in fact, without some such system grocers would be compelled to handle sugars and similar commodities at a loss.²

The system of requiring affidavits from the wholesalers has been given up by the sugar refiners, and it is expected that they will keep the agreement as to prices among themselves without special effort on the part of the manufacturers to force them to do so. Experience, however, shows that considerable cutting takes place.³ The grocers in the States of Ohio and Illinois have adopted a modification of the system, by which they have agreed among themselves to maintain prices of sugar within certain districts. If it is found that anyone has lowered his prices the entire number of jobbers in the district immediately lower theirs to the place in question, so as to prevent his securing any advantage.⁴

This system is perhaps best known in connection with rebates on sugar, but for a time, while the Distilling and Cattle Feeding Company was in existence, a somewhat similar rebate system was employed in the sale of spirits. The larger distributors and rectifiers received a rebate of 2 cents a gallon, and the wholesalers, after an interval, provided they had sold only the goods of the company, received a rebate of usually 5 cents a gallon, though the amount of the rebate varied somewhat at different times.

In the case of the whisky combination the company failed to keep on hand a sufficient amount of cash to pay these rebates promptly, and this delay in payment was one of the causes which led to throwing this company into the hands of a receiver.⁵

A similar system is found in the selling of soap, baking powders, etc., but the general principles vary in no essential particulars from the ones just given.⁶

More evidence will probably be taken on this subject later.

⁶ Smith, pp. 59, 65.

EXPORT TRADE.

The representatives of many of the combinations assert that they have made especial efforts to increase the export trade, and they consider the development of that trade one of the chief advantages to the country from the combinations. They believe that it would be impossible for this trade to be secured to anything like the same extent without the power that comes from large concentration of capital in the hands of one managing body.

The representatives of the Standard Oil Company furnished much evidence to show how extensive their export trade has become, and they urged repeatedly that this trade could not have been secured without the expenditure of large sums of money such as only a great combination could control.¹

Some of the rivals of the Standard Oil Company were of the opinion that without a great combination sufficient capital could readily have been furnished by others to secure and carry on an export trade no less imposing than that of the Standard Oil Company. They also show that the Pure Oil Company, perhaps at present the chief rival of the Standard, has secured a large export trade in Germany, and at the present time is making most of its profit from this export trade.² The total exportation of the independent refiners, however, is only a small fraction of that of the Standard. The assertion, however, that the export trade of the Standard has been built up at the expense of the domestic trade³ is vigorously contradicted by members of the Standard Oil Company. The chart of prices of crude and refined oil seems to show clearly that the regular prices at Bremen, Germany, are considerably higher than the prices in the United States, although there has been at least one and perhaps other exceptional times when the American price has been above the export price. This has been true especially in the far East on account of Russian competition.⁴ The explanation of this given by Mr. Archbold is that it was necessary to cut foreign prices for a time in order to secure the market.

The manufacturers of spirits are of the opinion that they could easily supply a large part of the foreign market with spirits were they not hampered by the provisions of the laws of the United States regarding the packages in which spirits shall be shipped, and also regarding bonding and payment of the tax.⁵ These witnesses, however, do not urge that the large capital controlled by the combinations would be necessary for this export business. They believe that our advantages in manufacture are so great that the export business would develop as a natural outgrowth of the situation, provided the restraints of the law were removed.

A somewhat similar line of argument is followed by those engaged in the iron and steel industries. Mr. Guthrie, president of the American Steel Hoop Company, believes that, owing to our superior natural advantages, under ordinary circumstances, it would even now be possible for a large part of our product to be sent abroad. At the present time comparatively little is exported owing to the enormous home demand, but he believes that we have the opportunities and facilities for manufacture which should enable us to export large quantities. At the same time the large capital of the combinations makes it possible to employ agents all over the world, and to spend large sums in pioneering.⁶ A similar opinion was expressed by Mr. Gates, chairman of the American Steel and Wire Company.⁷

As regards the relation of export prices to domestic prices, the statement is at times made that the two have comparatively little relation one to the other, inasmuch as

¹ Archbold, pp. 562-568; Rockefeller, p. 796; Dodd, p. 800.

⁷ Pages 1014-1017.

different conditions are met with in the different lines of trade. It is conceded that it is frequently true that export prices are made lower than domestic for the sake of securing the trade. It is claimed, however, that no disadvantage has come to the American consumers, nevertheless, because when the foreign market has been once secured the continuous full operation of the plants with the increased output reduces the cost of the entire product. Were it not for the export trade there might at times, it is conceded, be somewhat lower prices for the domestic market, but only under conditions that would result in a temporary check to production and, on the whole, the result would be a higher average of domestic prices.¹ In certain instances the export trade comes from the peculiar character of the product itself and has little to do with the matter of prices or with the power of a large combination.² The fact seems established that great capital aids much in extending the export trade. Great capital does not necessarily imply monopoly.

TRUSTS AND THE TARIFF.

Most of the witnesses who so far have been heard before the Industrial Commission on the subject of trusts have been directly connected with the industries concerned as manufacturers. Practically all of them testify in favor of the tariff upon the industry represented, whether they be members of the combination or its opponents.

The tariff, of course, has practically no influence in connection with the Standard Oil Company, except indirectly in its manufacture of tin cans and other collateral industries.

Mr. Havemeyer, president of the American Sugar Refining Company, asserts with much vigor that he believes the customs tariff law to be the mother of all trusts—except the Sugar Trust. When the protection is very high, instead of fighting one another he thinks the manufacturers get together to take all the profit possible. If this is not their attitude at first, vigorous competition among themselves, brought about by the great number tempted into the industry by the tariff itself, is likely to force them to see what they are losing, and combination follows. He is strongly inclined to the belief that the tariff on all industries should be kept as low as 10 per cent, thinking that to afford sufficient protection against foreign countries, while at the same time it is low enough so that trusts would not be encouraged, as he believes they are now, by the “inordinate protection” granted. He has particularly in mind, apparently, the steel and iron industries, although he also concedes that had it not been for the high protective tariff existing at the time the original Sugar Trust was formed he would probably not have taken the risk of putting his refineries into the trust.³

As regards the present tariff on sugar, Mr. Havemeyer thinks that the differential in favor of refined sugar, one-eighth of one cent per pound, is too low, and is of the opinion that it should be as high as one-fourth of a cent. In this particular Mr. Jarvie,⁴ of Arbuckle Bros., is inclined to agree with him, as are also Mr. Post,⁵ Mr. Buynitsky,⁶ and Mr. Doscher,⁷ but all concede that with the present low range of prices brought about by the vigorous competition no refined sugar can be imported.

Mr. Buynitsky, while favoring a protective tariff on the whole, is nevertheless inclined to think that it may be high enough to encourage the formation of industrial combinations to an injurious extent. He therefore would give to the President of the United States power to reduce the tariff on any particular monopolized article by Executive order to an extent not less than 5 per cent nor more than 20 per cent, for a period of not more than 5 years.⁸

⁷ Page 98.

⁸ Pages 49, 50.

Judge Gary, President of the Federal Steel Company,¹ while admitting that protection may sometimes perhaps permit monopolistic prices, does not think the plan of reducing it by Executive order practicable. That would injure firms and individuals outside the combination. It would be justifiable only in case the combination were distinctly illegal, and in that event the present laws are sufficient to suppress the monopoly. He believes that some tariff is still needed for the proper protection of the various steel industries, and does not believe that at the present time there is any monopoly in them.

President Reis, of the National Steel Company, does not believe that the tariff has had much effect on the iron and steel business during later years, and thinks that so far as his especial branch of the industry goes, the tariff would not be needed,² though he concedes that in other branches, perhaps, such as the manufacture of steel rods and black plates for tinning, it may still be needed.

President Guthrie, of the American Steel Hoop Company,³ thinks that without the present tariff on steel, his company could not compete, for example, in Galveston, Tex., on account of the extremely low freight rates from abroad. Protection is needed, in his judgment, to offset transportation rates, even though we have at the present time, and are likely to have still more in the near future, the possibility of exporting American steel.

Chairman Gates, of the American Steel and Wire Company⁴ believes also that the tariff is needed in order to enable us to pay transportation rates. It is still more needed because, as he asserts, the Germans get a subsidy on steel exported and are doing all they can to push their export business.

Regarding the tariff on tin plate there seems to be no difference of opinion among the witnesses. Mr. Graham testifies that there would have been no tin plate industry had it not been for the tariff.⁵ Mr. Reid⁶ says also that the industry was created by the tariff, and that while the tariff at present gives efficient protection, the removal of the duty would destroy the industry. He believes, however, that at the time he testified the price of tin plate might go 50 cents a box higher before it would meet with effective competition from abroad. Mr. Taylor, an independent dipper of tin plates, is inclined to the same opinion,⁷ while Mr. Griffiths, perhaps the most active opponent of the combination,⁸ testifies that the tariff is in no sense the father of the combination further than that the entire industry was created by the tariff. He also does not believe that the industry at the present time could exist without it, and thinks that certainly few, if any, would be bold enough to attempt to carry on the business without it.

FREIGHT DISCRIMINATIONS.

One of the chief causes, in the opinion of some of the witnesses, of industrial combinations, and at any rate one of the greatest evils in connection with them, is the discriminations which it is claimed they have received in the freight rates given by the railroads. In other investigations carried on by the Industrial Commission, especially that on transportation, it has been quite generally conceded by railroad men and shippers that even up to the present time discriminating rates are made in favor of large shippers.

So far as this especial investigation is concerned, discriminations have been emphatically denied by the manufacturers of sugar, both Mr. Havemeyer, of the American Sugar Refining Company, and one of his opponents.⁹ Apparently all of these refineries receive the advantage of free storage of sugar in the railroad warehouses at the distributing points, but there seems to be no discrimination in this regard. Sugar

⁹ Doscher, p. 90; Havemeyer, pp. 112, 113.

freights out of New York are divided among the different railroads in a certain proportion which has been agreed upon.¹

In the case of iron, steel, and tin-plate shipments, while discriminations were not acknowledged, there was hesitation on the part of the officers of two of the companies, at any rate, in denying directly that favors were received.² Outsiders knew of no discriminations.³

On the other hand, charges of the most emphatic and unequivocal nature were made by the opponents of the Standard Oil Company with reference to freight discriminations received by it.

I. BEFORE THE INTERSTATE-COMMERCE LAW.

It was charged by most of the leading opponents of the Standard Oil Company⁴ that the chief reason for the rapid growth of the Standard, and its apparent great success in underselling rivals and winning markets, was the special advantages that it had received from the railroads. It was claimed that the company not merely received discriminating rates on its own shipments, but that it was frequently paid rebates on the shipments of its competitors. It was conceded by representatives of the Standard Oil Company⁵ that before the passage of the interstate-commerce act special freight rates and rebates were frequently received.

It was asserted, however, that this was the usual custom on the part of all railroads with all large shippers, and that competitors of the Standard had received similar favors. Cases were referred to in which Mr. George Rice, an independent refiner, had received special rates, and it was asserted by Mr. Page that in one case at least Scofield, Shurmer, and Teagle had received a lower rate than the Standard Oil Company was able to secure. Mr. Rockefeller further asserted that the profits of the Standard Oil Company had not been accumulated from this source, but that whatever advantage it had received in this way had been given to the consumer in the way of lower prices.⁶

Mr. Page asserted that in no case within his knowledge had the Standard Oil Company received payments on oil shipped by its opponents. He admits, however, that his experience as to the period before the interstate-commerce act is not extensive. Mr. Rockefeller made the same assertion, stating that the only exception was in one case, where a small sum was received during a short time on shipments by Mr. Rice, though after complaints had been made all of the money so received was refunded before any action was brought in the courts. A like explanation of this case was made by Mr. Archbold.⁷

II. AFTER THE PASSAGE OF THE INTERSTATE-COMMERCE LAW.

Much greater differences of opinion exist with reference to the condition of affairs since the passage of the interstate-commerce act. It has been charged as a matter of general belief on the part of almost all of the opponents of the Standard Oil Company that these discriminations in various forms have been continually received, even up to date. On the other hand, these charges have been denied in toto and most emphatically by every representative of the Standard Oil Company with reference to all cases excepting one, which they claim was a mistake, the amount of freight due being promptly paid on discovery of the error. The Standard Oil Company not merely challenged the opponents to bring forth proof of any case, but

⁷ Archbold, pp. 556-559; Rockefeller, p. 796; Page, p. 790.

produced many letters from leading officials of railroads to show that the company had in no case received any favors or asked for them.¹

1. *Commissions*.—Certain opponents of the company claimed that the Standard Oil Company received commissions for shipping freight over railroads, which commissions amounted to rebates. This charge is emphatically denied by the Standard Oil Company and no positive proof on the subject has been offered.²

2. *Lubricating oil*.—Several of the witnesses have asserted that they found it practically impossible to sell lubricating oil to the railroads, and that they believe the railroads purchase their lubricating oil from the Standard Oil Company at high rates, and in that way give to the Standard Oil Company what is equivalent to a rebate in freight.³ This was denied emphatically by the vice-president of the Standard Oil Company of New York;⁴ and Mr. Page, vice-president and manager of the Union Tank Line, who has charge of the chief shipments of the Standard Oil Company, explained in detail the selling of lubricating oil to the railroads by the Standard Oil Company, asserting that in every case it guaranteed to the railroads as low a cost per train mile as could be or would be furnished by any of its opponents.⁵

3. *Logan, Emery & Weaver case*.—In one case brought by the firm of Logan, Emery & Weaver against the Pennsylvania Railroad, although Mr. Lee and Mr. Emery differ somewhat in their statements of details, evidence appears to have been given by accountants of the railroad showing that rebates had been paid to the Bear Creek Oil Refining Company for at least several months after the passage of the interstate-commerce act. These rebates were at the rate of from 3 or 8 to 20 cents per barrel, and amounted altogether to about \$24,000. The suit was never finally decided by the court, but the railroad compromised by paying the plaintiffs \$30,000 or \$35,000.⁶ Mr. Archbold testifies that in this case "the Standard Oil Company was in no way involved," and the opponents do not make that charge in this case.

4. *Shipments in tank cars*.—It has been charged that the Standard Oil Company receives advantages from the railroads, equivalent to rebates, through special privileges given to shippers in tank cars over shippers in barrels.⁷

It is true that for a year or two after the passage of the interstate-commerce act, up to 1888, lower rates were made per hundredweight on oil shipped in tank cars than on that in barrels. The Interstate Commerce Commission made a ruling against the practice in 1888, and there is no evidence to show that it has since continued. This first decision did not forbid charging for the weight of barrels themselves, but a later ruling, made in 1891, held that the weight of barrels, like that of tank cars, should be disregarded. From this ruling, and from the award of damages later made on the basis of it, an appeal was taken to the courts, and the question has not yet been finally settled. Whatever the outcome of the case may be, there can be no claim that the Standard Oil Company received special discriminating rates in this particular, as the same rates were offered to all shippers by tank cars.

It is, of course, true that the Standard Oil Company shipped far more by tanks than did any other shipper, but it is likewise true that the Standard Oil Company shipped also more by barrels than any other shipper, and Mr. Page intimates that the largest part of its shipments, if one takes into account the final distribution of the oil to the consumer, is by barrels. Whatever the truth may be with regard to the advantages derived by the Standard Oil Company through this method of shipping, it can hardly be charged that the company was receiving any discriminating rates that were illegal, inasmuch as all shippers were treated alike, including even Mr. Rice himself, who

¹ Lee, p. 292; Davis, p. 352; Phillips, p. 601; Westgate, p. 372; Archbold, pp. 516-528; Page, p. 778; Rockefeller, p. 795.

² Rice, p. 727; Page, p. 769.

⁷ Rice, pp. 711, 715, 749; Lee, p. 287; Lockwood, p. 388; Emery, p. 696.

makes the most emphatic charge. Moreover, the witnesses of the Standard argue with considerable force that payment of freight on the weight of the barrels is no more than just.¹

5. *Changes in rates.*—It was charged further by Mr. Rice² that the railroads, particularly in through shipments from Chicago to California, have at times made changes in their schedule rates after giving notice to the Standard Oil Company, and indeed by the instigation of that company, thus enabling the Standard to stock up while the freight rates were low, and in that way avoid the payment of the higher rates which its opponents, not knowing of the intended change, were compelled to pay. Mr. Rice submitted a series of letters and telegrams between officers of the railroads and the Standard Oil Company, dated during 1888, which confirms this statement. Mr. Page,³ in replying to Mr. Rice, denies any knowledge of the case cited, but makes the assertion that since 1891, at any rate, the freight rates to the Pacific coast have remained absolutely unchanged, so that this custom has not existed since that year.

6. *Underbilling.*—Several of the witnesses were of the opinion that underbilling of Standard Oil Company shipments was a frequent practice, the tank cars being often, or in the case of some roads, uniformly billed at the minimum weight of 24,000 pounds, instead of the actual weight depending upon the capacity of the car, which in many cases would amount to more than 40,000 pounds. Mr. Westgate claimed that he had seen 3 freight receipts for shipments of tanks from Olean, N. Y., at the 24,000-pound rate, when the true charge would have been on from 44,000 to 46,000 pounds for each tank. He was, however, unable to produce the freight receipts themselves, so that the numbers could be secured and the investigation made directly. Mr. Archbold denied these statements and produced affidavits from the general freight agents of the two railroads reaching Olean that shipments had not been underbilled for the Standard Oil Company from Olean, but that the company had invariably paid full rates as determined by the Tank Gauge Handbook.⁴

It was charged by Mr. Rice⁵ that shipments of naphtha had been made from Boston to Newport over the New York, New Haven and Hartford Railroad, during the year 1897, when the tank cars had been billed at 24,000 pounds instead of at their proper weight. The statement was further made that the facts as asserted had been proved before the Interstate Commerce Commission. Mr. Page went into this case in detail. In the testimony taken before the Interstate Commerce Commission it was proved that out of 16 cars shipped 7 had been underbilled. The statement was upheld by the testimony of railroad officials themselves that the underbilling was not at the instance of the Standard Oil Company, but was made by mistake of the railroad agents, the proper charge being afterwards made and promptly paid by the Standard Oil Company. One case of an overcharge in rate was also shown, which overcharge had to be refunded to the Standard.

The evidence seems to be to the effect that on none of these roads was any advantage granted to the Standard Oil Company in the way of underbilling on interstate shipments, except by the errors described. Witnesses, however, either admitted or refused to deny specifically that the Standard Oil Company sometimes, perhaps regularly, have cars billed at 24,000 pounds over the Boston and Albany road when the shipments are entirely within the State of Massachusetts.⁶

7. *Discriminations in Canada.*—It seems to have been established by the testimony of Mr. Gall⁷ that in Canada special local discriminations between Canadian and American oil over the same routes have been made within the last year or two. Mr. Gall claims that this is in favor of the Standard Oil Company, inasmuch as that company has bought up the Canadian refineries and thus gets an advantage from supplying the

⁶ Pages 770-775.

⁷ Pages 678, 675.

Canadian market with Canadian oil instead of American oil. Mr. Archbold¹ and Mr. Page² did not deny that these discriminating rates were made, nor did they make clear the extent of the control which the Standard Oil Company has of the refining interests in Canada, nor the relation of the Standard Oil Company to the railroads. These conspicuous local discriminations have been ordered discontinued by the Canadian government. It is shown also by several witnesses that the freight rates on oil exported from the United States into Canada have been very decidedly increased within the last year.³ Mr. Gall claims that this is in the interest of the Standard Oil Company for the reasons before given.

Mr. Page,⁴ in reply, claims that the Standard Oil Company has paid these advanced rates, and that it is by all odds the largest shipper into Canada, and, furthermore, that the shipments of the Standard Oil Company into Canada have increased since the increased freight rates went into effect. The witnesses on this point do not seem exactly to have joined issue, and the advantage or disadvantage which the Standard Oil Company receives in these freight rates is not clearly brought out.

8. *Agreements between pipe lines and railroads.*—The opponents of the Standard Oil Company claim further that, owing to agreements which exist between the railroads and the pipe lines in which the Standard Oil Company has controlling interest, the Standard Oil Company is benefited. By such agreements freight rates are kept fully as high as pipe-line charges, and the latter, it is claimed by opponents of the Standard, are several times greater than the actual cost of transportation in pipe lines. The Standard thus gains an advantage on its own oil transported through pipe lines.⁵

The agreement regarding which most was said was furnished in detail by Mr. Archbold, and will be found on page 663, in connection with Mr. Emery's testimony.

9. *Location of refineries.*—There can be no question from the testimony, but that the Standard Oil Company in certain sections of the country, particularly in New England, receives decided advantages from the location of its refineries in or near those sections. The more distant location of independent refiners places them at a disadvantage, while in certain cases at least the railroads refuse to give the shippers into that territory through rates on petroleum, such as are granted on almost every other kind of freight, but compel shippers of petroleum to pay the arbitrary local rates.

For example, shippers of goods from Titusville, Pa., to points in Vermont, Rhode Island, Connecticut, and other New England States, on most articles pay Boston rates; on petroleum the rate is arbitrary, a local rate being added to the through rate. In consequence refiners of petroleum in Titusville and Bradford, Pa., and other places, find it impossible to ship oil to such points as they think they could easily reach, provided Boston rates obtained. The Standard Oil Company, on the other hand, by shipping its oil into this territory from its refineries on the seaboard, either directly by rail or by tank steamers and rail, pays lower rates and in this way is enabled to control the oil market in that whole territory.

A somewhat similar condition of affairs seems to exist as regards the freight rates on Standard Oil shipments from its large refinery at Whiting, near Chicago, to southern and western points, as compared with rates from Cleveland and other points somewhat farther east. It is not claimed by anyone that the railroads in making these rates are doing anything illegal, or that the Standard Oil Company is receiving any illegal advantage. It pays exactly the same rates as its competitors pay when they make shipments in the same way; its only advantage comes from the fact that, considering the way the tariffs are made up, its refineries are more favorably situated. When one considers the way in which the railroads make up their freight schedules, naturally the opponents of the Standard Oil Company think they are arranged with

¹ Pages 572, 575.

² Page 788.

³ Gall, pp. 675-686; Westgate, pp. 375, 378.

special reference to the Standard Oil Company's interests. The Standard Oil Company certainly gains from this custom of the railroad companies, in refusing to give through rates.¹

10. It is charged that railroads again favor the Standard Oil Company by rules regarding the stoppage of tank cars at certain places for the distribution of their contents without payment of local rates, by the special rates that are charged upon tanks filled with oil which are intended as permanent stations, and other similar arrangements. These charges are made especially by Mr. Rice,² and are replied to in part by Mr. Page.³

EFFECTS OF COMBINATIONS ON LABOR.

1. *Employment.*—Several of the witnesses who have appeared before the Commission say that one effect of the combinations is to lessen the cost of production by lessening the number of laborers needed in certain departments.

The witness who was most insistent upon this view, Mr. Dowe, president of the Commercial Travelers' National League, estimated that large numbers of commercial travelers were out of work, owing to the new methods of business adopted by the combinations, and that many more had had their wages decidedly lessened. The lack of competition brought about by the combinations had made it, in his judgment, possible to employ a less skilled class of commercial travelers than was required under the former competitive system, as well as greatly to diminish the number. He believes common workmen are also displaced by combination.

Other witnesses, heads of industrial combinations, agreed with Mr. Dowe in part. Mr. Bradley, one of the directors of the Distilling Company of America, thought there was a decided lessening in the number of salesmen; his combination will be able to dispense with about 300 altogether.⁴ Others, like Mr. Clarke,⁵ were of the opinion that few employees had been discharged as a consequence of the combination; and that in all probability had the combination not been formed an equal number, or perhaps more, would have been discharged on account of the failures that certainly would have resulted from the competitive system. In the whisky business, however, both Mr. Clarke and Mr. Rice⁶ testified that common labor is, relatively speaking, an unimportant factor.

Mr. Gates, of the American Steel and Wire Company, testified that it had dispensed with the services of all but 15 or 20 out of 200 or 300 traveling men, as well as with those of about 50 per cent of its high-priced men—superintendents, officers, etc.⁷

While Mr. Lee was inclined to believe that the closing of refineries by the Standard Oil Company has worked, on the whole, against the interest of the workingman,⁸ he nevertheless agreed with practically all the other witnesses who gave evidence on this point that the Standard Oil Company pays good wages and gives steady employment to its men. Mr. Archbold, of the Standard Oil Company, said that he was a believer in combinations of labor, as he was in combinations of capital, and thought that the interests of the two were not opposed.⁹

In the sugar combination not many men, though possibly a few, have been thrown out by the absorption of competing refineries, and those remaining have received, on the whole, probably better wages than before.¹⁰

The officers of several of the large combinations, particularly those in the iron and steel industries, testified that there had been no lessening, but rather, owing to the great demand for the product, with the consequent enlarged output, a decided increase

¹ Lee, p. 286; Monnet, pp. 309, 316; Westgate, pp. 373-379; Page, pp. 768, 770, 776-778.

of the number of laborers employed in the ordinary branches of the business. On the other hand, the services of presidents, superintendents, and other high officials of the individual plants had been dispensed with when the combination was formed. Judge Gary, president of the Federal Steel Company,¹ testified to this saving, as did also Chairman Gates, of the American Steel and Wire Company,² President Guthrie, of the American Steel Hoop Company,³ and others.

2. *Wages.*—On the other hand, these men state that in the steel manufacture and its allied industries there has been a very decided increase, both in the number of men employed and in the rates of wages, since the formation of these corporations. For example, the Tin Plate Company has advanced the wages of its employees from 15 or 20 per cent upward, some few of the men receiving advances as high as 50 per cent.⁴ Mr. Reid furnished details of wages for some years tending to confirm his statements. In the National Steel Company wages have advanced from 15 to 20 per cent,⁵ while the American Steel and Wire Company has advanced wages, on the average, perhaps 40 per cent, and is employing from 30 to 40 per cent more labor.

In the Federal Steel Company also there has been an average increase of some 11 per cent, common labor being advanced about 16 per cent, while high officers and clerks at headquarters have had their pay lessened more than 6 per cent. President Gary furnished a table showing advances in wages in the different classes of employment, as well as the increased number employed.⁶ The American Steel Hoop Company had also advanced wages from 15 to 25 per cent.⁷ It should be remembered, in connection with all of these steel companies, that there has been a very decided improvement in business during the last year or two, and prices as well as wages have therefore gone up enormously. Part of the increase in certain cases is in fact to be explained by the operation of the sliding-scale system, although the base prices of the scales have also been advanced.

Mr. Griffiths, while recognizing that there has been an advance of wages by the American Tin Plate Company, testified that the feeling among the laborers was not at all in favor of the combination. While the workingmen knew that there had been some increase in their wages, they felt that on the whole they were more within the power of their employers than before. Some of the plants were closed down, for a time at least, early in the winter 1899-1900, and the men believed that the formation of the combination would help the employers in an attempt to lower wages in 1900. He based these statements largely on a letter from one of the workingmen employed by the American Tin Plate Company.⁸ Mr. Greer, the district superintendent of the American Tin Plate Company for the New Castle district, explained the reasons for the closing of the plants temporarily, and denied generally the statements of Mr. Griffiths.⁹

The opinion was general that when plants were closed in any industry there might and probably would be at least a temporary displacement of labor, though in many cases men would be simply transferred to other establishments.

In the case of the International Silver Company, the workingmen have also received an advance in wages since the combination of from 5 to 10 per cent.; there are no unions among the men employed in its establishments and the employees are dealt with individually. Many of the laborers are fairly well off, being permanent residents of the place where the works are established and owning their own homes.¹⁰

3. *Labor organizations.*—Nearly all of the combinations whose representatives appeared before the Commission manifest no hostility to labor organizations, but are on the whole inclined to favor them. As has been said, the Standard Oil Company believes in trade unions. The National Steel Company, the American Steel

¹⁰ Dodd, pp. 1052, 1056; Watrous, pp. 1064, 1066.

Hoop Company, the American Tin Plate Company, and the Federal Steel Company all employ union labor largely, although not exclusively. They deal regularly with the Amalgamated Association of Iron, Steel, and Tin Workers, and pay as a rule to the nonunion men wages that are substantially based upon the Amalgamated scale.¹

Chairman Gates, of the American Steel and Wire Company, asserted that his company did not recognize union labor as such, although it employs large numbers of men belonging to the Amalgamated Association. The various employers meet with committees of the men to agree upon rates of wages, but do not deal with the unions as such. In all of their establishments they expect to pay good rates; those which prevail in the locality for those grades of labor.²

Some of the witnesses were of opinion that in case of a conflict between employers and employees the large organization would have a decided advantage by virtue of its great wealth, perhaps chiefly from the fact that having a number of establishments in different sections of the country it would be possible to close two or three without materially affecting the prosperity of the organization.³

The great combination might also, if it controlled practically all of the establishments in the country, carry out an effectual boycott against individual employees who had opposed its policy.⁴

In some of the testimony that has been given before the Industrial Commission in other lines of investigation, leaders of labor organizations have testified that they do not fear the industrial combinations on the ground that has been mentioned, but that they believe that the unions are able to hold their own as effectually against the combinations as they could against the individual employers. They are further of the opinion that if the combinations are able, by virtue of their savings, to increase the profits of the industry, the laborers can perhaps, by pressure, maintain or increase their wages quite as readily as before the combinations were made. On this subject more testimony is expected.

Strikes.—The testimony is practically universal that the combinations have had little or no trouble in the way of strikes,⁵ although Mr. Griffiths testifies as regards the tin-plate workers that they have been dissatisfied,⁶ and that there has been some tendency at least toward strikes.

SOCIAL EFFECTS OF COMBINATIONS.

The opponents of the large industrial combinations believe that one of the most injurious effects to the country from such organizations is that people are deprived thereby of the opportunities for independent management of business enterprises, and that in consequence the mental and moral fiber of the community is weakened.⁷ Even witnesses who assert that combinations in certain lines of industry are on the whole advantageous and desirable speak with not a little feeling on this evil effect of them.⁸

Witnesses on the other side, however, believe that under the combinations there is every opportunity for individual initiative and independent activity that could be found outside the combinations, while the benefits in the way of greater financial profits, greater stability of business conditions, and potential lowering of prices would, at any rate in the long run, more than compensate for any possible disadvantage that might arise. Attention is called to the fact that when the combinations are effected, men well advanced in years, who would perhaps find it difficult to withdraw from business under other circumstances, seize the opportunity to withdraw from

active management of affairs, while younger men of greater energy, who are glad to take up the burden, are put in their stead. The fact that the combination is managed by a board of directors mostly made up of men themselves actively engaged in the business, while the superintendents in charge of the separate plants, often their former owners, have large discretionary powers and responsibility, seems to these witnesses to show that there is no lack of incentive to individual activity or possibility of weakened individual judgment.¹

The power which such combinations exert over persons whom they supply with goods or who are in any way dependent upon them brings out in a somewhat startling light this social effect. As laborers have, it is said, often been coerced by employers upon whom they were dependent, so some persons feared to give evidence or to let it be publicly known that they objected to the methods of business of some of the trusts, lest they be driven out of business by them.²

SUMMARY OF ADVANTAGES AND EVILS.

I. ADVANTAGES.

Those who advocate the formation of large industrial combinations claim that they possess over the system of production on a smaller scale by competing plants the following advantages:

1. *Concentration.*—By closing individual plants less favorably located or less well equipped and concentrating production into the best plants most favorably located a great saving can be effected, both in the amount of capital necessary for the production of a given product and the amount of labor required.³

Another advantage of the concentration of industry is that the plants which are kept employed can be run at their full capacity instead of at part capacity, and can largely be run continuously instead of intermittently, so far as the combination happens to control the larger part of the entire output—a material source of saving in certain lines of industry.⁴ A still further advantage of this concentration comes in the selling of the product, from the fact that customers, being always sure of ready supply whenever it is wanted, more willingly buy from the large producer, and that there is less loss from bad debts⁵. This readiness to buy from trusts, however, is denied, some witnesses holding that dealers prefer to buy from independent producers.⁶

In certain lines of industry much greater economy can be practiced, especially in the way of using by-products to better advantage in a large establishment than in a small one. Much difference of opinion exists among witnesses in most lines of industry as to the size of plant that can secure the most economical division of labor and use of by-products, without making adequate supervision too difficult.⁷

2. *Freights.*—Where the product is bulky, so that the freight forms an essential element of the cost, much can be saved by an organization which has plants established at favorable locations in different sections of the country so that purchasers can be supplied from nearest plants, thus saving the cross freights, which, of course, must be paid where customers are supplied from single competing plants.⁸

3. *Patents and brands.*—Where different establishments, selling separate brands, are brought together into one combination, the use of each brand being made

common to all, a great saving is often effected, since the most successful can be more efficiently exploited.

The control also of substantially all patents in one line of industry sometimes enables the combination to secure a monopoly which it could not otherwise secure.¹

4. *Single management.*—The great completeness and simplicity of the operation of a single great corporation or trust is also a source of saving. Where each of the different establishments which are united had before a president, a complete set of officers, and a separate office force, the combined establishment need have but its one set of chief officers, and subordinates at lesser salaries may take the places of the heads of separate establishments. In this way a material saving is often made in the salaries of the higher officials; while a considerable reduction of the total office force is also possible. It is likewise true that this same form of organization enables one set of traveling salesmen to sell all of the brands or all classes of goods for the separate establishments, and in that way much labor is saved. This is considered a great saving from the standpoint of the producer and consumer, but is likewise naturally considered an evil from the point of view of those who are thus thrown out of work.²

The more complete organizations also will distribute the work among the different plants in such a way that to each is given the particular kind of product for which it is specially adapted, and in many cases changes in machinery and changes of workmen from one kind of product to another are avoided, a source often of great saving.³

5. *Skilled management.*—The bringing into cooperation of leading men from the separate establishments, each having different elements of skill and experience, makes it possible to apply to the business the aggregate ability of all, a factor in many instances doubtless of great advantage.⁴ To some degree there may be a finer specialization of business ability, each man being placed at the head of the department for which he is specially fitted, thus giving, of course, the most skilled management possible to the entire industry, whereas before the combination was effected only a comparatively few of the leading establishments would have managers of equal skill.⁵

But this advantage, some think, is limited. The chief managers at the central office are likely to be large stockholders, and thus to have a strong direct interest in the success of the enterprise. This may hold also of many of the superintendents of departments. But others will be hired managers, and, it is claimed, a hired superintendent will not take the same interest in the establishment or be able to exert the same intelligent control as the owner of a comparatively small establishment. Moreover, minute supervision can not well be exercised in a very large combination.⁶

6. *Export trade.*—The control of large capital also, it is asserted, enables the export trade to be developed to much greater advantage than could be done by smaller establishments with less wealth at their disposal.

II. EVILS.

Among the evils of the great combinations those most frequently mentioned are:

1. *Employees discharged.*—When different establishments come together into one, it is often the case that certain classes of employees are needed in much less numbers than by the independent plants. This is specially true in the case of commercial travelers, and, also, perhaps in the case of superintendents and clerks in the offices. While this is generally admitted, it is considered by many to be an inevitable condi-

¹ Gates, p. 1081; Dodd, pp. 1049, 1050; S. C. T. Dodd, p. 796; Rogers, pp. 1070, 1073.

⁶ Griffiths, pp. 899, 900; Lee, p. 271.

tion of progress and only a temporary hardship which, like that resulting from the introduction of a new machine, will ultimately result in a greater gain.¹

2. *Methods of competition.*—The large establishments, by cutting prices in certain localities, while maintaining the prices in the main, have a decided advantage over the smaller competitors whose market is limited to the one field in which the prices are cut, and consequently can often succeed in driving their rivals out of the business.²

Connected with this method of competition is also the use of unfair methods, such as following up rivals' customers, bribing employees of rivals to furnish information, etc.

The sudden raising and lowering of prices by the combinations, without notice and apparently arbitrarily to embarrass their opponents, is also considered a great evil.

3. *Increased prices.*—When the combinations have sufficient strength, or for any reason get monopolistic control more or less complete, it is thought that they often raise prices above competitive rates, to the great detriment of the public.

4. *Speculation and overcapitalization.*—Another evil often charged against these newer combinations is that the promoter, by virtue of misrepresentations or by the concealment of material facts, is frequently able to secure very large profits for himself at the expense of the people at large who buy the stocks, and that in this way undue speculation is encouraged.

Connected with this evil which comes with the modern method of promotion is that of overcapitalization. Stock is frequently issued to four or five, or even more, times the amount of the cash value of the plants that are brought into the combinations. These stocks then placed upon the market go into the hands of persons ignorant of the real value of the property, who afterwards are likely to lose heavily. Pools are sometimes made to control the stock market, or other of the common ways of disposing of the stock by unfair methods are employed.³

At times also the officers and directors of the large combinations seem to have taken advantage of their inside knowledge of the business to speculate on the stock exchange in their own securities to the great detriment of the other shareholders.⁴

5. *Freight discriminations.*—Among the chief evils mentioned are those of freight discriminations in favor of the large companies, which many assert are the chief cause for the growth of the great combinations.

6. *Monopoly; its social effects.*—The fact that an organization possesses a practical monopoly and can in that way direct its operations at the expense of its rivals, thereby preventing competitors from coming into the field, it is thought, takes away from the individual initiative of business men and prevents particularly the younger men from going into business independently. The formerly independent heads of establishments entering the combinations are also, it is said, reduced to the position of hired subordinates. By these means, witnesses claim, the trusts are in reality sapping the courage and power of initiative of perhaps the most active and influential men in the community. This evil is denied by many of the members of the large corporations, who think that within those corporations are found opportunities for the exercise of judgment and enterprise and for rising in life which do not exist outside.⁵

REMEDIES.

1. *Let-alone policy.*—Several of the witnesses are of the opinion that any evils connected with the industrial combinations will be remedied in the ordinary course of business, and that any attempt at regulation by law would be likely to result in more harm than good. Competition, either active or potential, is believed by these witnesses to be a sufficient preventive of monopoly and extortionate prices, while stockholders and investors are believed to be already sufficiently protected by statute and common law, especially in view of the fact that the State can not guarantee to these persons immunity from carelessness and ignorance on their own part. It is also urged that, under the common law alone, the courts have always held as illegal any monopoly or combination distinctly shown to be in restraint of trade.

While making this general expression of opinion, some of these witnesses afterwards admitted that certain measures tending toward giving the public, and particularly the stockholders, more information regarding the nature of the business might be advisable.¹

2. *Direct suppression of monopolistic combinations.*—A few witnesses are inclined to favor the more general enactment of statutes along the lines of those already adopted by numerous States, directly prohibiting the transaction of business by combinations seeking to restrain trade or to control prices. Some witnesses believe that the present statutes, in regard to the States where they have been enacted, in conjunction with the national antitrust law of 1890, and the interstate commerce law, would, if vigorously enforced, be all the legislation necessary.²

Perhaps a greater number of witnesses, however, directly expressed themselves as opposed to so-called "antitrust" legislation, while others distinctly imply a similar opposition. These witnesses, including some opponents of individual combinations, as well as lawyers, hold that combination is a natural outgrowth of modern conditions, and that it is practically impossible to suppress it. If any legislation is needed, it should be in the form of regulation and publicity only.³

3. *Prohibition of destructive competition.*—Two or three witnesses testifying in opposition to the Standard Oil Company advocate legislation to prohibit "destructive competition." The witnesses have in mind especially the cutting of prices in local markets, while retaining them at high figures in other parts of the country. A requirement that, freight rates being considered, prices should be made uniform in all markets is advocated. It is also suggested that general cutting of prices below actual cost of production for the purpose of driving out competitors should, perhaps, be prohibited. No criticism upon these suggestions is offered directly by other witnesses.⁴ In connection with this Senator Lee advocated limiting capitalization.⁵

4. *Publicity.*—Many of the witnesses, including even representatives of combinations, are of the opinion that a much greater publicity regarding the affairs of such combinations than is now customary would tend to remove many of the evils. As regards the general public, the knowledge thus secured would avail to prevent the maintenance of extortionate prices as well as unfair methods and conditions of competition. Stockholders and investors would also be protected against abuses by promoters and officers of corporations.

How this publicity should be brought about and the degree to which it should extend is a matter upon which no general agreement existed among the witnesses. Some are inclined to think that it would be wise if somewhat detailed balance sheets

¹ Dos Passos, pp. 1140-1158; Stetson, pp. 972, 973, 980; Clarke, p. 187; Thurber, pp. 6, 14; Smith, pp. 68-70.

³ Lee, p. 294; Westgate, p. 938; Lockwood, p. 384.

⁴ Pages 294, 295.

of the accounts of the larger combinations could be made public. More of the witnesses, including especially lawyers and officers of corporations, seem rather of the opinion that when the corporation is first organized the details regarding its organization, the values at which plants and other property are taken in, the profits of the promoters, etc., should be made public. After the corporation has been engaged in business, however, while the details of its management should be made known with considerable fullness to the stockholders, the outside public should be given little more information than at present, lest thereby competitors may secure an advantage.

Many of the witnesses believe that publicity, if properly established and enforced, would prove a very efficient remedy. Others think that, while it might be useful, it would not alone be sufficient. At least one of the witnesses is of the opinion that this publicity should be enforced upon all public corporations, such as railways, street railways, etc., but not upon ordinary manufacturing or mercantile corporations.¹

Strong differences of opinion exist among the different witnesses as to whether legislation along any of the lines suggested, or additional legislation, should be by the individual States or by the Federal Government. The witnesses also disagree as to the constitutionality of various forms of legislation, both in the case of the States and in the case of the Federal Government. Some witnesses were of the opinion that State legislation would be of little service unless practically all of the States adopted uniform laws, and this is considered an impossibility. Others seem to think that legislation, even by a few of the States, if of the right kind, would be very useful. There is perhaps, however, a rather general expression of opinion among those who favor any legislation at all that Federal legislation, if constitutional, is desirable, at least to supplement State legislation as to combinations, if not, perhaps, to take entire jurisdiction regarding them.

5. *State legislation.*—The chief specific suggestions regarding State legislation were:²

(a) The classification of corporations should be made much stricter than at present, and each class should be confined closely to the exercise of its specified powers.

(b) There should be strict inspection of corporations by State officials, and publicity should be enforced through reports. This, of course, applies primarily to action by the States as regards their own domestic corporations. (See also above, under *Publicity*.)

(c) Combinations, in whatever form (even if it be that of a single corporation), between different corporations, where monopolistic intent can be shown, should be prohibited. (See also above, under *Suppression*.)

(d) Foreign corporations should be forbidden by each State to do business within its borders unless conforming to its laws. As to this last suggestion, the powers of States over foreign corporations, so far as their interstate business is concerned, would be very limited. It appears that the courts would be likely to hold that the States would require a special authorization from Congress to enable them to act with any considerable effectiveness in this regard, even if the power could be secured in that way.³

6. *Federal legislation.*—The lines of Federal legislation suggested fall mainly under the following heads:

(a) Creation of Federal corporations under strict Federal laws. Some would favor incorporation under Federal laws only in case of very large corporations, while from the legal standpoint some others would fix the distinction between State and Federal corporations along the line of commerce within the States as distinguished from interstate commerce. The representatives of combinations favoring such Federal

¹ Lee, p. 296; Luyties, p. 258; Thurber, pp. 15, 16, 20; Havemeyer, pp. 123, 136-138; Gary, pp. 996, 1001, 1002; Dos Passos, pp. 1162-1170, 1176, 1177; Stetson, pp. 975, 980; Moore, pp. 964, 966; Dill, pp. 1082, 1083; King, pp. 1108-1110; Allen, 1193, 1194.

² Allen, pp. 1193-1197.

³ Pam, p. 1085; Dos Passos, pp. 1173, 1174; Allen, pp. 1187, 1188, 1193-1195, 1207; Huffcut, pp. 1212-1216.

laws consider that one of their chief advantages would be to prevent unwarranted interference with the business of the corporations by individual States. Some of the witnesses, however, consider that the creation of Federal corporations would be harmful as well as unconstitutional.¹

(b) In connection with Federal incorporation, or apart from it, certain witnesses favor a considerable degree of regulation of corporations on the part of the Federal Government. In this connection, publicity, through reports and inspection, is advocated. A Bureau of Industry is suggested by one witness, having powers somewhat similar to those of the Interstate Commerce Commission. The reports to be made to this body should be of such a nature as to disclose the condition of the business of the corporation, especially as to whether it possessed or was likely to acquire a monopoly or not.¹

(c) *Strengthen Interstate Commerce Commission.*—Some of the witnesses complain of the inefficiency of the Interstate Commerce Commission. Others urge that it be given greater power, even judicial power, and that pooling among railroads be permitted under its supervision. Especially is it recommended in the testimony taken before the subcommission on transportation that its hands be strengthened by giving it power of audit of railway accounts, power of enforcing its decisions, etc., it being urged that in this way freight discriminations in favor of the large shippers, the combinations, could be prevented.

(d) Two witnesses are inclined to the opinion that unless Congress in some way assumes full control of corporations the United States Government should remove, by specific act of Congress, the limitations which now are likely to be laid by the courts, on the basis of the Federal Constitution, upon the powers of the States over monopolistic combinations, so far as their interstate business is concerned. It was thought, on the whole, that such an act of Congress would probably be upheld as constitutional by the courts.²

(e) *Removal or lowering of tariff.*—Several of the witnesses, though not objecting in the main to the principle of a protective tariff, were of the opinion that in some cases the tariff encouraged, or, even, as one said, was the chief cause of the trust. In such cases they thought it should be lowered or abolished. Mr. Havemeyer expressed himself most strongly in favor of a low horizontal tariff of not over 10 per cent, while Mr. Buynitsky proposed that if there were shown to be a monopoly in any protected industry the President might be empowered to lower the tariff on the products of that industry, by executive order, not more than 20 per cent, nor for a longer period than five years.

(f) *Powers of Congress.*—Much discussion was presented before the Commission as to the constitutional powers of Congress to enact legislation along any of the lines above suggested. It is admitted that Congress has exclusive control over interstate commerce, and the preponderance of opinion seems to be that it has power to create corporations to carry on such commerce, although this is disputed. Congress is admitted to have no power over purely manufacturing corporations not engaged in interstate business. There is much doubt, however, as to the precise line where business ceases to be domestic and becomes interstate. Professor Huffcut, at least, is inclined to think that the courts, even under the present Constitution, would uphold quite general control over the general business of corporations carrying on a widespread business among the several States, on the ground that a large portion, at least, of that business—perhaps most of it—is interstate in character. The control of that would practically control all. In this connection this witness suggests that Congress could probably constitutionally compel such large corporations to submit to Federal

¹ Thurber, p. 14; Arehbold, pp. 565, 560; Rogers, p. 585; Havemeyer, pp. 186-138; Gary, pp. 1000, 1008; Gates, p. 1022; Pam, pp. 1087, 1088; Myers, pp. 1133, 1138; Dill, pp. 1087, 1088; Moore, p. 665; Stetson, p. 981; Dos Passos, pp. 1159-1161, 1174; Allen, pp. 1194, 1206, 1209.

² Huffcut, pp. 1211, 1215, 1216; Allen, pp. 1194, 1208.

legislation, and perhaps to incorporate under Federal laws, by one of the three following methods:

(a) By forbidding the use of the mails to State corporations engaged in interstate commerce, especially so far as they are shown to be monopolistic and therefore subject to the police power.

(b) By levying a practically prohibitive tax upon State corporations engaged in interstate commerce, as has been done with note issues of State banks. Other witnesses suggest that the Government can acquire jurisdiction, in order to compel reports and publicity, by imposing taxes, and some are inclined to suggest that these taxes should be made progressive.

(c) By directly prohibiting State corporations from engaging in interstate commerce.¹

INDUSTRIAL COMBINATIONS AND PRICES.

By JEREMIAH W. JENKS.

The effects of the industrial combinations upon prices form certainly one of the best tests of their usefulness or disadvantage to society. The popular impression seems to be that these combinations very greatly increase prices to the consumers. On the other hand, the trust managers and their advocates are in the habit of claiming that, owing to economies of management, the trusts lower prices to consumers, while at the same time they increase the wages of their employees.

It is of course comparatively easy by the selection of statistics at certain chosen periods to show either of these results. It has, in consequence, seemed wisest to secure as far as possible average monthly prices of the leading raw materials and finished products of several of the larger combinations for a series of years, and to plot these on charts in such a way that the relations at all times between the two can be most readily seen. Wherever it has been practicable, European prices have been compared with American, in order that the influence of the trust itself might more clearly be brought out.

The differential or "margin" between the price of the raw materials and that of the finished product should show, other things equal, the cost of manufacture plus the profit. Unless one is somewhat guarded, however, one is likely to reach false conclusions if this assumption is made without qualification. In nearly all processes of manufacture there is a considerable element of waste of raw material. As the price of the raw material increases, the value of this waste is also correspondingly increased. In consequence, in order that the profits may be the same, the margin between the price of the raw material and that of the finished product should increase slightly with the increase in price of the raw material. Again, when the raw material has to be held in large quantities, so that it involves the investment of considerable capital, it can be readily seen that the interest charge for carrying this raw material is not a little increased as the price of the raw material rises. This, of course, is a factor of less importance than the other, but nevertheless is worthy of consideration.

So far as the manufacture of wire rods and nails is concerned, the necessity of increase of margin as price rises is brought out clearly by Mr. Gates in his testimony;¹ but the same fact holds with reference to the manufacture of tin plate, of wire and nails, and of refined sugar from raw, as well as in most other lines of business. Special attention will be called to this fact in the comment upon each individual chart.

SUGAR.²

The lines on the chart represent standard raw and refined sugars in the United States, England, and Germany. For America raw sugar is represented by 96° centrifugal, and refined by granulated. The English raw sugar, Java Afloat, corresponds closely with the American 96° centrifugal; but the English refined sugar, Tate's Cubes, is a special grade, which normally brings somewhat more than the regular price of granulated sugar—at times, probably, nearly half a cent more. The consequence is that we should expect the margin between the raw and refined in England to be somewhat greater than the American margin between 96° centrifugal and granulated.

¹ Page 1908.

² The prices from which the chart has been made were taken from Willett and Gray's Statistical Sugar Trade Journal as noted in the tables on pages 40-44. In the Journal English and German prices were given in shillings and pence per hundredweight of 112 pounds. They have been reduced to cents per pound in order that comparisons might be more readily made, and the chart more easily plotted. The convenient rule for reduction given in the Journal of January 4, 1900, from which the prices of foreign sugars are taken, has been followed.

40 THE INDUSTRIAL COMMISSION:—INDUSTRIAL COMBINATIONS.

The German sugars shown, both raw and refined, are of somewhat poorer quality than the American sugars. The margin between them, other things equal, would be, perhaps, not quite so great as that between the American raw and refined. The fact that it is so much less is due in part, doubtless, to the German bounty on the exportation of refined sugar. It is also probable that the cost of refining in Germany is somewhat less than here, and that under normal conditions the Germans are satisfied with a somewhat smaller profit.

The effect of the sugar combination upon prices of sugar can perhaps be most readily seen from the course of line C, which represents the perpendicular distance between lines B, representing 96° centrifugal sugar, and line A, representing granulated sugar, both of them wholesale prices in the New York markets. The distance, then, of C from the bottom of the chart represents the cost of refining, including selling cost, plus the profits. The line c in the same way represents the English cost of refining, plus the profits, it being remembered, however, that the English refined sugar is of a somewhat higher grade than the American granulated. The line c, it will be noted, ran somewhat above 1 cent a pound, perhaps on an average between a cent and a quarter and a cent and a half, from 1880 to 1887, the time of the formation of the sugar trust in the United States. There seemed to be no lowering in this English margin during the years 1883 to 1887. From the beginning of 1888 on to 1894 this line seems to have lowered slightly, but, on the whole, to have remained about the same. From 1894 to date there seems to have been again another lowering, the line representing on the whole since that date something less than 1 cent a pound.

On the other hand, line C shows that during the years from 1883 to 1887 there had been a very decided lowering in this margin in the United States, owing, of course, to vigorous competition among the independent refiners. From the testimony given by

the witnesses,¹ this competition was so very destructive in its nature that a large percentage of the American refiners—18 out of about 40—had failed.

In 1887 the trust was formed. The margin was immediately raised more than half a cent a pound, at times even fully 1 cent a pound. During the two years, 1888 and 1889, when one takes into account the lessened cost of manufacture that came from the organization of the combination, one may fairly judge that the trust made enormous profits.

The margin fell again in the latter part of 1889. This was owing to the fact that large competing refineries, especially those built by Claus Spreckels at Philadelphia, had entered the field.² For rather more than two years, while this vigorous competition continued, the margin fell back to a point substantially as low as had existed before the formation of the trust. In February, 1892, the trust bought up the competing refineries and the margin was at once put back to the non-competitive height. From the years 1892 to 1898 this margin remained, relatively speaking, high, with, as will be noted, a slight gradual lessening, owing presumably to the improvements in refining and the consequent lessened cost. Throughout all these years, with the exception of the time when there existed vigorous competition between the trust and the Spreckels refineries, it will be noted that, on the whole, there was a close correspondence between the English margin and the American, the changes in the duty upon sugars having apparently only a slight temporary effect upon this margin, although the removal of the duty on raw sugar by the McKinley tariff affected very decidedly the price of sugar to consumers.

In the latter part of 1898 vigorous competition against the American Sugar Refining Company (the reorganized trust) began on the part of Arbuckle Brothers, Claus Doscher and others. Prices were immediately cut so that the margin between raw and refined sugar has fallen again very decidedly. Instead of standing from 75 cents to \$1 per hundred pounds, as had been the case most of the time during the 3 or 4 years preceding, it has remained during the last year at but a little above 50 cents, and at times has been even below that.³

This study of the chart, then, especially when we compare the American with the English and German margin, shows clearly this: The sugar combination has, beyond question, had the power of determining for itself, within considerable limits, what the price of sugar should be, low or high, with or without competitors, although when there has been competition, it has chosen to cut prices to drive out its rivals rather than to run the risk of letting them gradually take its market on account of its high prices.

During about 9 of the 12 years which have passed since the organization of the trust the margin between raw and refined sugars has been considerably higher than it was for 3 years before the trust was organized, and than it has been during the 3 years when there has been vigorous competition.

The combination forced the fighting so severely against Mr. Spreckels as a competitor that he was apparently glad to sell out after about 2 years. The present contest between the trust and its opponents has continued for about a year and a half and at present shows no sign of ending but this, that with perhaps the exception of Arbuckle Bros. the opposition refineries are run at far below their full capacity, and presumably are making practically no profits.⁴

The chart seems to show also that the trust has had very little if any effect toward steadying prices. The fluctuations, both in the price of sugar and in the margin, seem to be fully as great since the combination was formed as before, and to be rather greater, on the whole, than the fluctuations in the English or the German market.

The assertion⁵ that the price of sugar would have been higher if it had not been for the formation of the trust seems to have a partial, but only a partial, justification in the chart. The chart does make it perfectly clear that during periods of the most vigorous competition the sugar refiners were doing their work on a very low margin. The large number of refineries that went into bankruptcy before the formation of the trust seems to show clearly that the margin was ruinously low. While it is probably for the economic advantage of the country that the weakest competitors be forced out of business from time to time, it can hardly be considered for the benefit of the country that competitors of substantially equal strength carry competition so far that all are running at a loss, and that a large percentage of them go into bankruptcy. When competition is so fierce, the inevitable result would be that, as Mr. Post says,⁶ the few who survive would be able, owing to the lessened supply, to

⁵ Post, p. 166.

⁶ P. 166.

put prices at considerably above normal competitive rates, and would be encouraged to do so because they could not well supply the demand. Such a course of procedure would thus lead inevitably to very great fluctuations in prices from those abnormally, not to say ruinously low, to those abnormally high.

On the other hand, while there does seem to be this partial justification for the claim that the trust has lowered the price of sugar on the whole beyond what it would have been had the combination never been formed, the relative steadiness of the English margin at a point which, in the main, seems lower than ours, considering the higher grade of English refined sugar, as well as the exceedingly high margin found frequently in the United States since the organization of the trust, would seem to show that the price of sugar in this country has probably, on the whole, been rather higher than it would have been under what might be called reasonable competitive rates, and certainly considerably higher than it would have been under conditions of competition such as have existed during the last two years.

A still further fact which leads to the same conclusion is that Mr. Havemeyer, the president of the American Sugar Refining Company, seems unwilling to concede that the cost of refining is as low as his competitors assert. Mr. Jarvis¹ says that with a margin of from 50 to 60 cents sugar can be refined without loss. Mr. Doscher² agrees, saying that it can be done without loss when the margin is 50. Mr. Post³ places the margin somewhat higher, but concedes that a large establishment like the trust would have an advantage of from 3 to 5 cents a hundred in refining. Mr. Havemeyer,⁴ on the other hand, puts 50 cents a hundred as the bare cost of refining, and declares that 24 cents more at least must be added on account of the waste in raising sugar from 96° to 100°, the polariscope test of the refined, thus making the margin necessary for profit some 75 cents a hundred, instead of from 50 to 60. Apparently he thinks it wise to reckon in some interest on investment with the cost, which the other witnesses seem not to have done. He admits that "no great damage is done" when the margin is at 75 cents. There is a profit if all is in good working order.

Another point which is to be considered, although it is one which is scarcely noticeable, or noticeable only in certain special cases, on the chart, is this, that in order to secure the same profits the margin between raw and refined sugar should be slightly greater when the price of raw sugar is high, inasmuch as the loss of weight is a more expensive waste. If, for example, with raw sugar at \$3 a hundred there were a 7 per cent waste, let us say, in refining, this loss would amount to 21 cents a hundred; while if, with the same 7 per cent waste, the price of raw sugar were \$4 a hundred, the waste would amount to 28 cents. We see, therefore, that in order to make the same profit, the margin should be 7 cents a hundred more in the second case than in the first. The witnesses speak of unusually vigorous competition and a consequent low margin each year from December to March while the Louisiana crop is being refined and marketed, but this does not appear with any regularity.

On the whole, the chart seems to make it perfectly evident that the sugar combination has raised the price of refined sugar beyond the rates in vogue during the period of active competition before the formation of the Sugar Trust and the two competitive periods during its existence. We can perhaps hardly judge so accurately as to what might have happened had the combination not been formed, but the price has probably been somewhat raised, although there is doubtless some force in the argument of Mr. Post to the contrary.

The chart does not give us any information regarding the effect of the sugar combination upon the price of raw sugar. That seems to follow in the main, as would be expected, the fluctuations in the prices of raw sugar in both England and Germany, with the decided differences that we should expect at times from the effect of our tariff. It does, however, show some remarkable fluctuations. The advance in prices in 1888 and 1889 was due principally to a shortage in European beet crops and in the Cuban cane crop, which led to wild speculation in Europe. It is probable, as several of the witnesses testified, that owing to its peculiar strength as a buyer of raw sugar the trust is able to depress the price slightly, perhaps $\frac{1}{2}$ of a cent,⁵ but this is not enough to be clearly shown on the chart. It is probable, too, and this in fact seems to appear, that whenever there comes a decided drop in the price of raw sugar the trust has been able to delay slightly, though only for a brief time, the corresponding drop in the price of refined; while on the other hand, increase in the price of raw is attended almost immediately by an increase in the price of refined, the trust thus being able to hold itself for its own advantage, to a slight degree, independent of market conditions.

S

WHISKY.¹

A study of the line showing the difference between the price of the raw material, corn, per bushel, and that of the amount of the finished product, spirits, derived from one bushel of corn, shows nothing else so clearly as the very great fluctuations in this margin. The price of corn, of course, owing to variations of crop and to various factors which determine demand, fluctuates greatly. At present—as was the case at one time earlier while the Distilling and Cattle Feeding Company was in the hands of a receiver, General McNulta—the price of spirits is based directly upon that of corn, so that the fluctuations correspond in the main; but for most of the period represented on the chart this is not true.²

During the years 1881 to 1887 various pools were formed among distillers, most of which lasted less than a year. The chart shows clearly that during the existence of each pool the prices of alcohol were kept up and the profits were correspondingly large. When, however, the pool suspended, profits fell to a minimum, the margins doubtless often being below the cost of manufacture. At the formation of the trust in 1887 prices were cut for a time in order to force competitors into the organization, but within a few months prices were raised and profits became very large. These profits stimulating competition, however, it became necessary again at the beginning of 1889 to cut prices very decidedly in order to force rivals into the combination. For some two or three years after this prices and profits were kept, on the whole, fairly high; but in 1892 and 1893 a period of speculation led to very startling sudden changes in prices and corresponding changes in profits so far as sales were actually made. It was of course true that at many times the sales were very small.

While the chart attempts to show the prices without the rebates, which were paid to wholesalers during the years 1890 to 1895,³ as well as the quoted market prices, one can not be entirely sure of the accuracy of the chart in this regard, inasmuch as it has been impossible to secure with absolute certainty the dates of the various rebate changes. The chart is, however, not far out of the way if at all.

Since the formation of the American Spirits Manufacturing Company in 1895, while the business has been somewhat more stable than during the last years of the Distilling and Cattle Feeding Company, at no time until very lately has the combination had complete enough control of the market to be sure of steady prices and corresponding profits. It will be noticed, however, that for the last year and a half conditions have, on the whole, been much more favorable for the combination than before, it having more nearly secured the control of the market.

The chart as a whole would seem to show that the whisky combinations have been able to hold prices and profits high only for short periods, inasmuch as they have almost invariably attempted to overreach and secure too high profits. They may hold prices stable for a few months, but when the changes do come they are much more radical and much more disturbing to the trade than would be the changes, relatively speaking slight, which would come under the régime of free competition.

According to the testimony of the President of the Distilling Company of America and one of its directors, the combination has finally adopted the policy of comparatively low profits but invariably secure ones. It remains to be seen whether, for the next two or three years, it will be able to carry out this policy, which from the point of view of the combination, if it is managed on business principles and not for the purpose of speculation, is a wise one.⁴

PETROLEUM.⁵

In considering the chart showing the prices of crude and refined petroleum, attention should be called to the fact that figures for crude oil, though in terms of bar-

¹ The figures upon which this chart is based are to be found on pp. 515-517. The prices of spirits were derived from the reports of the Peoria Board of Trade, and are trust prices at that point. The price of corn, derived from the same source, is No. 2 corn at Chicago, the basis which is at present used by the Distilling Company of America in fixing its price for spirits.

For the last few months the prices of spirits have been furnished by the Distilling Company of America, and the price of corn by the Secretary of the Chicago Board of Trade.

² McNulta, p. 206; Rice, pp. 845, 847.

³ Clark, p. 171; McNulta, p. 207.

⁴ Rice, pp. 845, 847; Bradley, pp. 514, 515, 527.

⁵ The prices for crude and refined oil for export have been taken from the Derrick's Handbook on Petroleum, with the exception of those for the last few months, which have been furnished by the Standard Oil Company. The prices of Standard White Illuminating oils at New York, Chicago and Cincinnati, have been furnished by the Standard Oil Company. Prices were given in bulk, and 24 cents per gallon was added for the cost of the barrel. This cost of the barrel would of course vary slightly, but the rule of 24 cents per gallon is one that is laid down in the Handbook of Petroleum, and is probably a fair general average. The prices of export oils at Bremen were taken from the Handbook for the earlier period, and for the last few months have been furnished by the Standard Oil Company.

48 THE INDUSTRIAL COMMISSION:—INDUSTRIAL COMBINATIONS.

rels, are given in bulk, the package not being included in the price, whereas those for refined oil are given in barrels, including the package. This is in accordance with the usual system of quoting these prices.

I.—Prices of refined export oil at New York, crude oil at Oil City, and the difference between them.

It will be noted that the price of export oil at Bremen is regularly above the price not merely of that same quality of oil in this country, but even of the higher grade standard white illuminating oil. For a brief time in 1893 the New York price stood above the Bremen price. The independents claim that the very low price in Germany during that year resulted from an attempt to prevent their getting a foothold in the German market.

It will be noted that the prices of oils in New York, Chicago, and Cincinnati are charted on a scale five times greater than that of the main chart. This has been done in order to show the difference in prices between the three different markets under consideration. On the whole, the price of oil in New York stands somewhat above that in either of the other two cities, New York being somewhat further removed from the oil fields, while the prices at Cincinnati are lowest.

The rapid and decisive fall in the price of refined oil in New York in 1896, it is claimed, was due to the competition of the Pure Oil Company. In March it put some wagons there selling oil. Prices dropped very rapidly until, as Mr. Lee says, they were below cost. Mr. Archbold makes a somewhat different statement of the figures, and points to the fact that the crude oil was rapidly falling. The chart shows also that prices in both Chicago and Cincinnati fell in like proportion, if not even more rapidly, at the same time. The Pure Oil Company began exporting oil to Germany in October, 1896, with apparently somewhat better facilities than the independents had had before, which may possibly account in part for the rather rapid fall of oil in Germany at about that time, although crude oil was also falling.

While there is a general correspondence between the figures in these different markets, there are nevertheless special fluctuations in each market, which seem to be largely independent of fluctuations in the others.

If we take the chart as a whole, and note the margin between the price of crude and refined petroleum represented by the line B, we shall see that this margin lowered very much more rapidly during the early years of the industry than of late. This, of course, is to be expected, as methods of production are much more rapidly improved during the early years of an industry than later.

There has been more or less of an association among the oil refiners who have made the Standard since 1872. This did not, however, in the earlier years seem materially to affect this margin, which kept steadily decreasing until 1879 or 1880. The Standard Oil Trust was formed in 1882. From that time on for a period of eight or nine years it is noticeable that there is only a slight decrease in the margin. From 1891 until 1898 the margin seems to have been steadily nearly or quite a cent lower than for the period preceding. But the period of the smallest margin seems to have been in the years 1893 and 1894.

Of late years, according to the testimony of several refiners,¹ there has been a very decided increase in the value of the by-products, the profits from the by-products being apparently equal to those from illuminating oil. Under these circumstances it was perhaps to be expected that the price of refined petroleum, as compared with that of crude, would have lessened still more than has been the case. During the last 2 years there has been a decided increase, not merely in the price of refined petroleum, but also in the margin between crude and refined. For the last year this higher margin is to be at least partly explained by the added cost of refining, coming from the increase in cost of supplies. For example, refineries are constructed largely of iron and deterioration in them is rapid. The price of iron has increased considerably more than 100 per cent during this period. It is also true that within the last year there has been an increase amounting at times to as much as half a cent per gallon in the cost of packages in which refined oil is carried, and the price of acids has also increased. These facts would explain, in part at least, the increase in margin, so that the profits have not been so much greater than they were before, as might be inferred. The general testimony of the independent refiners, however, seems to show that conditions have been somewhat easier for them during the last year or two than earlier, and the large dividends of the Standard Oil Company of over 30 per cent for each of the last three years would also seem to indicate that profits have increased.

Although the independent oil producers have said much about the arbitrary acts of the Standard in fixing the prices of crude oil, the greater general changes seem to have been due to the changes in supply brought about by other causes. The discovery of the very productive fourth sand oil wells in Butler County, Pa., only about 80 feet under the third sand levels, led to a great increase in production and the consequent rapid fall in price noted on the chart in 1873 and 1874.² Mr. Lee³ claims that the fall of the preceding two years was brought about by the general demoralization in the business caused by the relations of the railroads with the South Improvement Company and its successors. But that year was also the panic year. The checking

of the flow in the next 3 years raised the price again, when the discovery of the famous Bradford fields in 1876 led to the great decline of 1877 and 1878. Likewise the depression in 1891-1893, though not so marked, was caused by the discovery of the McDonald field in Allegheny County, with some of the largest wells ever known in this country. The sudden rise in 1895 seems to have been due to the discovery of the fact that the amount of oil on hand and the production were declining very rapidly as compared with the demand,¹ and to a consequent desire to get stocks ahead. It was thought that some of the refiners had sold ahead, and that the advance in crude was largely arbitrary, and intended to overthrow them. At any rate there was urgent demand on a short supply, and the market was largely speculative for a time. In 1897 another decline is due to the opening of the West Virginia fields, while the present rise is to be ascribed to another decided check in the output, which is clearly destined to grow worse unless new fields are discovered.

TIN PLATE.²

The most striking fact which appears in the chart is the very rapid increase in all prices during the year 1899—steel as well as tin plate.

¹ *Production, shipments, and stocks of Pennsylvania crude oil for the years 1892-1896.*

² On this chart the prices of steel billets, found in connection with the steel and wire chart, have been taken from the Iron Age, which is, perhaps, as trustworthy as any single authority can be. The figures may be compared with the prices of the Bellare Steel Company furnished by Mr. Reid, the President of the American Tin Plate Company, and printed on page 868.

The prices of tin and of tin plate have been furnished at the request of Mr. Reid by Phelps, Dodge & Co., of New York City, while Mr. Reid has himself given as nearly as was possible the cost of labor of manufacturing one standard box of tin plate (p. 868). The prices printed below, furnished by Mr. Griffiths, one of the opponents of the tin-plate combination, giving the cost of the material used in the manufacture of a 100-pound box, will prove useful for comparison:

WASHINGTON, PA., January 25, 1900.

The following prices for material represented in the manufacture of tin plate is taken from our books during the months designated:

Price of tin plate per box, 100 pounds, 14 by 20.

July	\$13.65	September	13.50
December	13.05	November	13.55
		1898.	
February	13.25	March	14.75
March	13.68	April	14.50
April	13.55	May	14.50
May	13.50	July	15.65
June	13.65	September	16.16
August	13.55		

Tin-plate bars from July, 1896, to December 31, 1896, were \$22.75 per ton; from January 1, 1897, to July, 1897, they were \$20 per ton; from July, 1897, to November, 1898, we paid \$17.50 per ton.

Price of billets ranged from \$1.50 to \$2 per ton less than bars.

WM. H. GRIFFITHS.

The causes of the rapid increase in the price of steel, the chief raw material, are perhaps many, but, from the standpoint of the manufacturers, and for our purposes here, it will be sufficient to say that the enormous increase in the demand for steel of all kinds is, perhaps, to be considered as first and most important. There has been during the last year a decided increase in the demand for steel rails, not merely for the building of new railroads, but also for the relaying of old track with heavier rails, because of the heavier rolling stock now used on the most important roads.

Structural steel for buildings is now used in enormous quantities, whereas for this purpose its use was almost unknown ten years ago. Steel bridges on railroads and elsewhere are rapidly displacing all the wooden bridges. The use of pressed steel for railroad cars is almost entirely new. Chairman Gates, of the American Steel and Wire Company, is of the opinion that these later uses of steel have increased the demand for that article within the last 2 or 3 years by more than the total output of steel for the whole United States fifteen or twenty years ago.¹ It is, in all probability, due to this enormous demand for new purposes that the great increase in its price has come about. The increased demand for steel and consequent increased price has been to a considerable extent reflected in the prices of iron ore and pig iron, in the charges for the transportation of ore, and in the higher wages of labor. This increase in the price of steel, which, of course, is the chief raw material in the manufacture of tin plate, of necessity has forced up the price of tin plate.

Tin, as will be especially noticed from the tables printed in connection with the chart,² has increased within the last two years from some \$14 a hundred to double that price. Labor also, since the 1st of July, when the new arrangements were made with the Amalgamated Association of Iron, Steel, and Tin Workers, has increased some 20 per cent on the average.³ The diagram shows clearly the decided increase in all of these costs.

The line D, representing the perpendicular distance between the lines B and C, shows the cost of manufacture, aside from the labor, which is included in B, plus the profit in manufacturing. It will be noted that from the beginning of 1895 up to the middle of 1897, in spite of one decided drop in the latter part of 1895, this difference between cost and selling price remained somewhat above \$1, say \$1.10 to \$1.20 a box. About the middle of 1897, there was a decided decline in price, which, with slight variations, continued until October, 1898. Before the organization of the American Tin Plate Company, in December, 1898, there had been, in October, a decided increase in the price of tin plate, and the increase had been more than proportionate to the increase in the price of the raw material, which had advanced as early as July. It was, of course, known to most of the tin-plate manufacturers that the combination would probably be formed, and presumably the different establishments had already stopped in part the most vigorous competition. This increase in the margin between the cost and selling price continued rapidly until March, 1899. From that time on there has been no further general increase in the margin, although there have been fluctuations.

The very strong demand for tin plate would probably have enabled the manufacturers to increase this margin, even if the combination had not been made; but the union of practically all the manufacturers under one management enabled them to make the best use of the opportunity, and thus the margin was put back to substantially the same as it had been during the year 1896 and the first part of 1897. Since March, 1899, however, the increase in the price of American tin plate has not, on the whole, been more than the increase in the value of the raw material, plus the increase in labor cost, facts which were testified to in October by officers of the combination.

The course of events seems to have been this: The price of steel and tin was advancing rapidly, and this advance would naturally tend to lower the margin between the material and the tin plate. For the three months, April, May, and June, the price of tin plate was not increased and the margin, in consequence, fell. In July and August the price of tin plate was increased very rapidly, so that the margin was put back nearly, but not quite, as high as in March. The continued increase in the prices of the raw material in September lowered the margin, while a temporary decrease in the raw material in October raised it again. Another increase in the price of the raw material lowered it again in November and December. It will be noted, therefore, that on the whole there has been not a relative increase in the margin, but rather a slight decrease since last March, although the average margin is considerably higher than at any time during the year 1898 and as high as it was during the year 1896 and the early part of 1897.

PRICES of

It will be noted here also, as in other cases, that in order to secure the same profit there should be a slightly greater margin when the prices of the raw materials are high than when they are low. It may fairly be considered, therefore, other things equal, that profits since March, 1899, are no higher but are rather lower than they were at that time, even though the price of tin plate has very decidedly increased.

The chart does seem to show that the combination had power at the beginning to press the advantage that came with combination. While the margin may be at the present time no higher than it was in 1896, it is perhaps fair to assume that the cost of manufacture has been somewhat lessened, and that, in consequence, the profits are now rather higher than they were before when the margin was the same.

The line E represents the imported coke tin plate laid down at New York, duty paid per full weight box. The line F shows the same thing, exclusive of duty. The distance, then, between these two lines represents the duty and the average rate of freight from the Welsh port to New York. The prices are the cost of importation to the jobbers without profit. The McKinley tariff of 2.2 cents per pound took the place of the preceding tariff of 1 cent a pound, July 1, 1891. It is noticeable, however, that, anticipating the change, the price of tin plate had advanced nearly a year before, so that when the act takes effect despite the increase in the price of imported tin plate, there appears a drop in line F. The lowering of the duty to 1.2 cents per pound, August 28, 1894, is shown clearly by the drop in line E from September to October. The drop in price, however, did not come so that it shows decidedly in monthly prices until the month after the duty was removed, a fact which appears in the sudden rise and fall of line F. The change from 1.2 cents to 1.5 cents per pound in the Dingley law, taking effect July 24, 1897, it will be noted, was also anticipated some six months in the increased price, as shown in line E, and the apparent drop in line F when the act legally took effect.

STEEL AND WIRE.¹

In this chart, also, the most noticeable fact is the very rapid increase in all prices during the year 1899. This increase in prices is to be chiefly ascribed to the enormous

¹The prices for the chart showing the crude and finished iron and steel have been furnished by the editor of the Iron Age, at the request of Mr. Gates, Chairman of the American Steel and Wire Company. Prices of steel billets are Pittsburgh prices; those of barbed wire are those at mill; those of smooth wire and nails are New York prices. In this chart steel billets have been taken as the raw material; all of the other articles may be considered finished products. In order to avoid confusion of lines, only E, showing the margin between the prices of the crude material and the finished product, wire nails, has been drawn. In like manner, lines might be drawn showing the margin between the price of steel billets and the prices of barbed wire and smooth wire.

Average monthly quotations of steel billets at Pittsburgh per gross ton, 2,240 pounds.

demand, both at home and abroad, for steel of all kinds, as was explained in connection with the chart showing prices of tin plate.

If we note the line E, showing the margin between the price per hundred pounds of steel billets D, and that of wire nails C, we shall note that there was a steady decline in this margin from the year 1890 to 1895, in the early part of which the lowest point was touched. During the latter part of 1895 and until nearly the close of 1896 there was a very decided rise, not merely in the price of wire nails, but also in the margin. This great increase in the margin was due chiefly to the influence of the wire-nail pool, which, during that period, secured substantial control of the market for a time. The sudden fall in the latter part of 1896 came at the time of the breaking of the wire-nail pool. It is also true that at about the same time there was a change of base for the fixing of the market prices of wire nails, but this change in the base did not modify materially the margin as it appears in the chart.

It will be noticed, however, that after the break in the wire nail pool the margin during the years 1897 and 1898 still remained considerably higher than it had been for three years before the formation of the pool.

The marked increase in the price of steel billets began in November, 1898: the increase in the price of wire nails followed in the succeeding month, and both have increased very rapidly during most of the time since. In addition to the increase in the price of steel billets, there has also been a decided increase in the wages of the laborers engaged in the manufacture of wire and wire nails.

The increase in the wages of the workingmen is not shown in the chart, but from the testimony¹ the increase in wages among the wire and nail workers has been greater than that among the workers engaged in the manufacture of steel billets, so that there would normally be, on that account, some increase in the margin.

Another reason for an increase in the margin besides that of an increased profit is this: There is always a considerable waste in turning the raw material, steel billets, into wire or wire nails. If, for example, this loss were 5 per cent, in the case of steel valued at \$15 a ton the loss would be 75 cents, whereas if steel were \$30 a ton the

² Change of base.

loss would be \$1.50. Steel has more than doubled in price; in consequence with the same profit the margin should have increased somewhat.

On the whole, however, it seems, both from the chart and from the testimony given before the Commission, that the margin, as represented by the line E, indicates also quite a decided increase in the profits. It will be noted that in the last two months of the year 1899 there was a decided falling off in this margin, showing that just at that time, at any rate, there was a check in the profits, the finished product having lost a little in price, while steel billets had gained. In October the fall in price of billets had increased profits. The presumption is here, as in the case of tin plate, that there would have been without any combination a decided increase, not merely in the price of the finished product, but also in the margin between the crude and the finished product, on account of the enormous demand. The testimony seems to be uniform on this point, that none of the manufacturers have been able to meet the demand; but in this case also it seems certain that the combination was able to take advantage of the opportunity better than individual manufacturers could have done.

Another factor needs to be taken into account in the consideration of the chart. The figures represented are those furnished by the Iron Age. It is probable that there are no other figures in this country that represent more nearly actual market conditions. At the same time each individual manufacturer makes his sales independently, and these sales are largely made by contracts extending over a period of some months, sometimes even over a period of one or two years. In consequence of that fact, the majority of the manufacturers of steel may be selling their output on a contract price fixed six months before, while the few manufacturers who are making late sales may be obtaining a price 50 per cent higher.

As a matter of fact, judging from the testimony given, the quoted market prices during the first half of the year 1899 were probably considerably higher than the prices actually realized by the manufacturers. On the other hand it is also probable that the prices at the close of the year 1899 represent much more nearly, in the case of both the crude and finished product, the real prices secured by the manufacturers. While these different circumstances need to be taken into consideration, it is, nevertheless, doubtless true that the chart represents fairly well the changing conditions of business during the period covered.

While on the chart the margins between the price of billets and those of smooth wire and barb wire are not shown by separate lines, it is not difficult to see that the changes for the last year, since the American Steel and Wire Company was formed, January, 1899, are substantially the same as those for wire nails. That company, through ownership of patents, has a legal monopoly in barb wire; but in all lines the prices have advanced rapidly for reasons already given.

TOPICAL DIGEST OF EVIDENCE.

[Prepared by E. DANA DURAND.]

NOTE.—References to the pages of the testimony are made in parentheses at the end of the paragraph or section giving the substance of the statements of the particular witness on the topic. The statements and opinions of the various witnesses who are classed under the different combinations, so far as they have to do with general questions—advantages of combination, legislation, etc.—are placed under the separate heading "General aspects," p. 213.

LIST OF WITNESSES.

	Page of testimony.
Atkins, Edwin F., manufacturer and importer of sugar	801-812
Buynitsky, Stephen N., assistant chief of the customs division of the Treasury Department	43-55
Doscher, Claus, independent sugar refiner, Brooklyn, N. Y.	87-101
Havemeyer, Henry O., president of the American Sugar Refining Company	101-138
Jarvie, James N., member of the firm of Arbuckle Brothers	138-147
Mas, Ernest, former consulting chemical engineer of the Glucose Sugar Refining Company	72-87
Post, James H., commission merchant in sugar and molasses	147-166
Smith, G. Waldo, president of the Wholesale Grocers' Association of New York City	55-73

I. CAUSES OF ORGANIZATION.

A. Excessive competition.—Prior to the formation of the Sugar Trust in 1887, competition had become so excessive that prices were reduced to an unremunerative figure. The margin between the prices of raw and refined sugar was only 0.71 cent in 1884, 0.78 in 1885, and 0.76 in 1886. Eighteen out of about 40 refineries had failed. (THURBER, 5, 21, 22; HAVEMEYER, 107-109.)

Mr. ATKINS, who sold his refinery to the American Sugar Refining Company in 1887, states that the refining of sugar in those days was not profitable. The refining capacity was largely in excess of the demand; everybody wanted to run full time, and the consequence was that none of the refiners made any money. His own company had been improving its plant for a number of years, but had paid no dividends. (811.)

B. Undue protection by tariff.—Mr. HAVEMEYER further implies, without a very direct statement, that the higher protection formerly afforded to the business of sugar refining was a contributory cause of the formation of the trust, although he considers the present protection insufficient. Under the former laws the profits were apparently so great that competition was unduly stimulated, and the combination was formed with a view to securing the possible advantages of the protection. It should be noted that Mr. Havemeyer specifically declares that the tariff is the prime cause of the formation of most combinations. (See p. 214.) The following is quoted from Mr. Havemeyer's testimony (133, 137):

"Q. But I asked you this question: If the refining industry of this country was built up under protection or a free-trade system?—A. Protection; enormous protection. Without the tariff I doubt if we should have dared to take the risk of forming the trust. It could have been done; but I certainly should not have

risked all I had, which was then embarked in the sugar business, in a trust unless the business had been protected *as it was* by the tariff."

"Q. I put those two things together—first that the protective system has brought such domestic competition that you are compelled to form a trust to keep each others' throats from being cut?—A. That is just the case with sugar. Have I not just told you that prior to the formation of the Sugar Trust 18 companies went out of business, failed, were ruined, and that is the advantage of the tariff? But if you do not stick to real protection in itself, but give these producers 40 to 60 per cent, then they are bent on mulcting the public. The great trouble is the tariff, and there you are."

II. EFFECT ON OUTPUT, PRICES, AND COMPETITION.

A. Control of output.—Mr. HAVEMEYER's testimony before the Lexow committee in 1896 was read to him, and he stated that he stood by every word of it. In that testimony he was asked as to his evidence before the United States Senate committee in 1894, wherein he said that the trust was organized "with a view of controlling the price and output to the people of this country." He answered that that object of combination was not in his mind now, though it doubtless was when he made the statement. He would rather say now that the intention was to control the output of the refineries joining the trust and the price of their products. "It goes without saying that a man who produces 80 per cent of an article can control the price by not producing." He admitted that his company undoubtedly, in fact, controlled the product and price in the United States. The formation of the trust removed competition to a great extent. (125, 126.)

The present output of the American Sugar Refining Company, according to Mr. HAVEMEYER, is about 30,000 barrels a day, its capacity about 40,000 barrels. The witness believes it is now producing 90 per cent of the total output and could produce 20 per cent more than the entire demand. The various competing refineries could probably produce 50 per cent of the required output. In 1896 the witness testified before the New York committee that his company produced from 75 to 80 per cent of the refined output. In 1891, when the trust was changed to a corporation, it was making 67 per cent of the entire product. (107, 111, 124, 126.)

Mr. POST is of the opinion that the American Sugar Refining Company does not restrict production abnormally. All business is regulated by supply and demand. The capacity of refineries exceeds consumption, so that there must be some restriction. If it were not for combination, failure of some refineries, owing to excessive competition, would soon close them as effectually as under combination. Competing refineries at present are operating on as small a scale as possible, because profits are little or nothing. The Mollenhauer and National refineries have probably averaged about one-third of their capacity during the first 6 months of 1899. (154, 160.)

B. Variations of prices according to competition.—1. *Generally.*—Testimony concerning the effect of the sugar combination on prices indicates that there have been great fluctuations in the margin between raw and refined sugars since the formation of the trust in 1887, owing to the establishment from time to time of competing refineries, some of which have later been absorbed by the combination. The following table shows the prices of raw and refined sugars and the margin between them for each year. (HAVEMEYER, 103.)

The comments of the witnesses upon the fluctuations shown in this table vary slightly in details, but there is agreement on the general movements. Immediately after the formation of the trust in 1887 prices were raised considerably to offset the excessively low prices of the preceding years. The margin in 1888 was 1.258 cents.

Mr. THURBER adds that when the business was got into working order and economies in manufacture had been effected by closing inferior plants, this margin was reduced.

Mr. HAVEMEYER and Mr. POST merely call attention to the reductions in the margin caused by the competition of the Spreckels' refineries, which began in 1889, and the less severe competition of the Mollenhaner refinery, established in 1890. The margin stood at 0.7 cent in 1890 and 0.8 in 1891. In the latter part of 1891 the Spreckels' refineries were bought up, and the margin was raised to 1.1 cents, which, as Mr. Havemeyer states, "is the usual margin we had laid out as necessary for the benefit of the stockholders and proper conduct of the business." The removal of the tariff on refined sugar in 1890 is also stated to have affected the price, although its effect on the margin is not clearly pointed out. The National and McCahan refineries were established in 1892, but there seems to have been little competition until the establishment of the Arbuckle and Doscher refineries, in 1898. The "interlopers" have brought the margin below 0.5 cent, destroying all profit. (Thurber, 5, 21, 22; Havemeyer, 107-109, 136; Post, 148, 149, 165.)

The history of the competition of these two last-named refineries is given more in detail by several witnesses.

2. *Arbuckle Brothers.*—Mr. JARVIE, a member of the firm, testifies that Arbuckle Brothers started a wholesale grocery in Pittsburg in 1858. They began business in New York in 1870, making a specialty of roasted coffee in pound packages. Having a patented method of filling, packing, and weighing, they sought to apply it to handling sugar as well as coffee. They found it impossible to make money by buying sugar from refineries, and so established a refinery, which began operation in September, 1898. Its capacity is about 4,000 barrels daily, and the witness believes it can refine as cheaply as the American Sugar Refining Company. Before Arbuckle Brothers entered business the margin between raw and refined sugar was about 90 cents per 100 pounds. The American Sugar Refining Company began cutting prices, apparently with the purpose of crushing the Arbuckles out of business. The Arbuckles have followed the prices made by the American Company, unless they believed it was cutting secretly, when they made open cuts.

Arbuckle Brothers think that they can stand the losses if a company selling 90 per cent of the total product is losing on the entire amount, and they are in business to stay. Offers for purchase of their refinery have been made by outside parties, but there have been no conferences with the American Company directly. Arbuckle Brothers have markets in various parts of the country, depending on freight rates. They do not believe freight discriminations are made in favor of the American Company. The prices of both concerns are the same, but some dealers and consumers prefer Arbuckle sugar, which they consider superior. The American Company is putting up sugar in small cotton bags to compete with Arbuckle packages. (138-142, 146.)

According to Mr. JARVIE, the present excessive competition has completely destroyed profits. The evils of excessive competition would be lessened "if the American Sugar Refining Company should be willing to sell less than 100 per cent of all the sugar sold in this country." (146.)

Mr. DOSCHER also believes that the American Company has generally cut prices first and Arbuckle Brothers followed, their prices usually being the same. At one time in December, 1898, however, the Arbuckles cut one-sixteenth cent below the American. This was the lowest price reached. The margin necessary for profit is 50 to 60 cents, while the actual margin has been running between 32 and 51 cents. (95, 96.)

An important incident of the competition between the American Sugar Refining Company and Arbuckle Brothers is that the former has entered the coffee business in retaliation, so as to compete with the Arbuckles in their own field.

Mr. HAVEMEYER testifies that the American Sugar Refining Company "are in the coffee business, and in it to stay." Havemeyer & Elder bought out the Woolson Spice Company, of Toledo, and sold it to the Sugar Company. The price of coffee has been greatly reduced by this competition. Previously the price of green coffee had been 10 cents, of roasted 15. The cost of roasting is about 3 cents. The Sugar Company reduced the margin to 2½ cents, the price of green coffee meanwhile having dropped to 6 cents because of the great increase in the crop. The Sugar Company desired to avoid excessive cutting of prices by making a superior quality of coffee. The first cut was made largely through the fear of a fall in the value of the stock on hand by the decline of the price of green coffee. (113, 114.)

Mr. JARVIE confirms this evidence as to the course of prices of coffee. The American Sugar Refining Company, he adds, is selling roasted coffee for 8½ cents, made from a grade of green coffee costing about 6 cents. The Arbuckles' coffee is sold for 9 cents, their green coffee being worth more than 6 cents. The former difference between green and roasted coffee was 5 cents, so that profits have been greatly reduced by the competition. (140.)

3. *Doscher refinery.*—Mr. DOSCHER testifies that the New York Refining Company began operations November 1, 1898, the margin between raw and refined sugar having varied during that year from 70 to 97 cents. The American Sugar Refining Company was already cutting prices against the Arbuckles and the margin kept getting lower. It has varied between 32 and 51 cents. The American Company has usually cut prices first, the New York Company following, but at one time the latter followed a lower cut made by the Arbuckles, maintaining it for 7 days. The American Company has made some special cuts in localities where it had refineries near. The witness has heard and believes that officers of the American Company have expressed the intention of putting down prices sufficiently to run him out of business, and that they thereby hope to prevent others from competing for some years to come. But he never heard anyone state that he had heard this actually said by such officers. The witness has had no conferences with the American Company nor with the Arbuckle Company as to selling his property or for any other purpose. He has been questioned by outsiders as to whether his company wanted to sell, but does not know whom they represented. The witness formerly owned the Brooklyn refinery, which joined the trust, and he now owns stock in the American Company.

Mr. DOSCHER has been unable to earn any profit by refining with the present margin of about 50 cents per 100 pounds, but has made some gains by advances in prices of raw sugar on hand. The witness believes the cost of refining in his establishment as low as in any other, but does not know what it costs others, nor exactly what it will cost him when under more regular operation. He had expected to make a nice profit if the margin of from 70 to 97 cents had continued. The capacity of his refinery is about 1,000,000 pounds, or 3,000 barrels, per day. (88-91, 98, 100.)

4. *Other refineries.*—Besides the Arbuckle and Doscher refineries there are several other smaller ones outside of the trust. The independent refineries are enumerated by Mr. HAVEMEYER as follows: Arbuckle, Doscher, Mollenhauer, and National, of New York, Nash & Spalding of Boston, McCahan of Philadelphia, Cunningham of Galveston, Henderson & Cogswell of New Orleans, and the Crockett Refinery of San Francisco; their capacity is equal to 50 per cent of the required output. In answer to the question whether the American Sugar Refining Company had any interest in the Mollenhauer and Nash refineries, the witness said: "I prefer not to state about that. That is a little bit too private." (107-109, 186.)

Mr. POST, as selling agent of the Mollenhauer and National refineries, knows that they do not sell under agreement with the American Company, but are entirely

independent. He knows also that the American Company does not control the Arbuckle, Doscher, Nash, McCahan, or California Beet Sugar and Refining companies, nor two or three in Louisiana and Texas. These refineries are now running much under their capacity, being willing to allow the American Company to sell most of sugar at existing prices. The witness believes the American Company will cease excessive cutting before long. (150, 153.)

Mr. THURBER states that while the Mollenhaner, Doscher, and Union refineries have no connection with the American Sugar Refining Company, they do not extensively cut prices in competition. They follow prices set by the trust, demand being sufficient to take their output; although it takes only about two-thirds of the capacity of the American Company. Sometimes refiners having a surplus stock temporarily cut prices. (14.)

C. Policy of trust toward competitors.—The general policy of the American Sugar Refining Company toward its competitors is stated by Mr. HAVEMEYER in this way: It is very vital to the prosperity of the company to keep up its output. When competitors begin business, prices must be lowered with the primary purpose of retaining trade. If the result is to crush competitors, that is their affair, not the affair of the trust. It is thus the purpose of the trust to see to it that competitors do not stay in business too long. Moreover, it aims to keep prices so low that additional competition will not be likely to be provoked. (108, 120.)

D. General tendency of combination regarding prices.—Broad statements of opinion as to the general influence of the trust on prices and its effect on the consumer are made by several witnesses.

Thus Mr. THURBER believes that although prices were raised above the ruinous figures prevailing before the organization of the trust, reduction to reasonable figures followed as soon as savings in cost of production began to be made. (5, 21, 22.)

Mr. POST believes that the combination has reduced prices to consumers. The company has not used its possible power to secure exorbitant profits, but has kept the margin small because of existing and possible future competition. The witness believes the margin would have been greater if the trust had not been formed, in spite of the fact that it was so low before it was organized. The weaker houses would have been driven out and demand for sugar would have exceeded the capacity of surviving refineries, forcing up prices. But if the American company had exclusive control, he adds, it would be dangerous. Its managers might not always be as broad minded as Mr. Havemeyer. Competing refineries do influence prices in the interest of consumers. But if the number of competing refineries were increased there would be no gain, for some would soon be driven out of business. (158, 159, 165, 166.)

The same witness adds, in this connection, that the price of refined sugar does not always show the real sum received by refiners; often one-eighth cent should be deducted, owing to methods of selling. This would affect the margin similarly. The figures above quoted show the average margin from 1890 to 1898 to be 14 cents per 100 pounds less than for the 7 years before the organization of the trust in 1887. The average from 1888 to 1898 was 96.6; from 1885 to 1887, when competition had destroyed all profit, about 75. (148, 149.)

Mr. ATKINS, whose refinery joined the American Sugar Refining Company at the time of its organization, testifies that the combination is manufacturing sugar at such a low cost that it would scarcely be possible to compete profitably against it. With the small amount of protection which now exists, the American refiner must economize in every way possible to undersell the European competitor. While it is possible that independent companies or an association of them may at some time effectively compete against the American Sugar Refining Company, it is scarcely probable. The witness believes that the price of sugar has been on the whole reduced to the people by the combination. The lower refined sugar is sold the larger the demand; consequently it is profitable to reduce the margin as far as possible. (811, 812.)

Mr. HAVEMEYER states clearly the policy of the trust as to prices. He does not "care 2 cents for your ethics," but thinks it is fair and right as a business proposition "to get out of the consumer all you can," consistently with business principles. While a trust could perhaps demand the utmost prices that the consumer would bear, it is quite another matter whether it would do so. They would be kept as high as possible without provoking additional competition. In view of the economy of concentrated production, the witness believes that the trust could thus make proper profits, while the consumer would obtain goods at lower prices than before combination, and competitors with fewer economies would not be inclined to enter. When competitors do start in business, it is the policy of the sugar com-

bination to secure the continuation of its output, which is very vital, and therefore to see to it that they do not stay in business too long.

Trusts are not in business for their health, nor will they sell their product for less than they can get unless for sufficient reason. Nevertheless, combinations in all articles would be beneficial to the consumer. The consumer benefits by the reduction of prices during the fight with competitors. If competitors are driven out the losses would be evened up by higher prices, but in the long run prices would be reasonable.

In the sugar business, Mr. Havemeyer adds, the competition of the Louisiana crop, lasting from about December 1 to March 1, tends regularly to depress prices and margin, after which the policy of the trust is to increase the margin so that the rate of average profit is about one-fourth cent per pound, which in the long run is the rate deemed most advantageous to the trust, in view of possible competition. The witness elsewhere refers to the desire of the trust to maintain a margin of about 1.1 cents between raw and refined sugar, as fair to the stockholders. The period up to 1893 is especially referred to in this connection. (108, 120, 134, 135.)

E. Method of fixing prices.—Mr. POST testifies that the prices are usually announced at the office of the American Company in the morning, and if other refiners change their prices that is announced a little later. Usually competitors follow the price fixed unless they have a surplus of sugar which they want to dispose of immediately, when they may keep the price one-sixteenth to one-eighth cent below the American Company. Preferences of grocers, and of brokers who distribute sugars to wholesale grocers, influence purchases where prices vary. The brokers of the Mollenhauer and National companies fix prices for their product, but after consultation with those companies. (149, 150.)

F. Rebates.—Several witnesses describe—their testimony agreeing in its general outlines—the system of rebates to wholesale grocers in the handling of sugar, and its effects. The system was introduced at the instance and for the advantage of the wholesalers, not of the trust itself. It has not been used largely as a means for controlling the trade by the combination.

Previous to the formation of the Wholesale Grocers' Association, about 1888, competition had completely wiped out all profits in handling sugar, which constituted a large proportion of the business of wholesale grocers. The association agreed to sell sugar at an advance of one-fourth cent per pound on its cost. This arrangement was broken up, and certain leading jobbers then conferred with the American Sugar Refining Company. It was agreed that sugar should be billed to the wholesalers at three-sixteenths cent above the previous price, and that after 3 months a rebate of three-sixteenths cent per pound should be paid by the combination, provided sugar had not been sold at less than the price billed. This arrangement was agreed to by practically all dealers in New York, New Jersey, and New England, and it was later extended over the entire country. This rebate allowed grocers, probably, a small profit, estimated by Mr. Thurber at about 4 per cent, although Mr. Smith is doubtful whether there is any profit. (THURBER, 13; HAVEMEYER, 126; SMITH, 55; POST, 154.)

The following is the circular formerly employed by the American Sugar Refining Company in proposing to individual jobbers the terms of the rebate system (127):

NEW YORK, ———, 189 .

DEAR SIR: We inclose herewith invoice of even date, from which you are entitled to our usual deductions of 1 per cent trade discount on 100-barrel lots and 1 per cent for cash if paid within 7 days.

Should you so desire, we shall be pleased, upon receipt of within written request, to constitute you one of our agents, in which case sugar will be consigned to you for sale as our factor, upon the following terms, the title to remain in us subject to your advances and return to you of your necessary outlay.

1. You are to advance to us within 30 days the amount of the invoice, which will be made up at our daily quotations, less 1 per cent trade discount on 100-barrel lots, with the right to deduct 1 per cent additional if invoice is made cash in 7 days; the advance to be without recourse to, or reclamation upon us, and to be due in any event.

2. The sugar when sold is to be billed in your name, although in fact as factor for us, and you shall without reclamation upon us, at your own cost, pay all expenses, and assume all risks of the property, and of payment of collection. You are not to incur any expense on our account.

3. None of the sugar shall be sold or disposed of by you, either directly or indirectly, for less than our daily quotations with freight added from refining point

to point of sale (as per equality rate book), nor on more liberal terms as to credit or cash discounts.

So long as the foregoing conditions are observed by you, we will, upon an affidavit to that effect, pay you a commission of three-sixteenths of a cent per pound, and in addition thereto you shall retain the profit, if any, over the advance made as above provided. In case of any failure to comply with either of the above conditions no commissions will be payable. Settlements will be made for each month's commissions at the expiration of 3 months thereafter. All commissions payable for the period preceding the 3 months will then become due. Payments will only be made as above.

This agency is terminable at the pleasure of either party on written notice.

Yours, respectfully.

THE AMERICAN SUGAR REFINING COMPANY.

This rebate system still continues, but it appears not to be effectively enforced. Numerous jobbers have cut the prices of sugar, and those who maintain the agreement lose many customers. This change is not attributed to the competition of new refineries, but is charged by some witnesses to the failure of the jobbers themselves to keep faith, and by others to the carelessness of the American Sugar Refining Company in regard to enforcing the contract and requiring affidavits that goods have not been sold below the price fixed. Mr. Havemeyer says that the affidavit was abandoned by the trust, in 1897, on account of legislation against it, but adds that the agreement was never successfully enforced. (HAVEMEYER, 136-128; SMITH, 55-59; POST, 154.)

The general opinion appears to be that the system is a legitimate and necessary one to prevent losses to dealers through excessive competition. Mr. SMITH specifically states that he believes the system is honorable, just, and legal. Without it dealers are compelled to perform a public service in distributing goods without a reasonable compensation, which is against public policy. Experience has proved this repeatedly. (66, 68.)

The agreement as to rebates has never stipulated that jobbers shall not handle the products of other refineries. In fact, the various competing refineries have themselves copied the system. Thus Mr. THURBER states that the members of the Wholesale Grocers' Association are not confined to buying sugar from the American Sugar Refining Company. They buy as they choose, having now 5 different sources of supply, and have the same rebates from all companies. (18.)

Mr. JARVIE also knows of no contract by which wholesale grocers are restricted to handling the product of American Sugar Refining Company. Arbuckle Brothers sell through wholesale dealers exclusively, giving a rebate of three-sixteenths cent in addition to ordinary trade discounts. No affidavit is required. (142, 147.)

A modification of the rebate system has recently been established in Ohio, owing to decisions of the courts against the rebate system. In May, 1899, the wholesale grocers adopted a plan among themselves designed to prevent cutting and to equalize prices according to freight rates. The plan is essentially to divide the State into six sections, and in case it is proved that prices have been cut to any retailer, all wholesale grocers in that section are required to reduce their price correspondingly to the place in question, taking away all profit and placing all on an equal footing. A circular stating the plan in full is quoted. A similar plan has been in operation in Illinois, and has helped to keep prices up to profitable rates. (POST, 153-157.)

III. COST OF REFINING.

We can not judge of the justice of the prices secured by the Sugar Refining Company or estimate its profits without knowing the cost of refining sugar.

While no minutely specific statements were made by the witnesses as to the cost of production, the general consensus of evidence goes to show that the margin necessary between raw and refined to secure any profit is from 50 to 60 cents, and the presumption is that when it falls below 50 cents refineries are, not doing a profitable business. This margin includes the cost of refining proper and also the loss of weight in refining.

Mr. JARVIE made the above as a general statement, but refused to state the precise cost of refining in his own establishment, Arbuckle Brothers. (139.)

The cost of refining, Mr. HAVEMEYER points out, is not the same as the margin between 96 degree raw sugar and granulated. The commercial value of a degree of sugar is 6 cents per 100 pounds, so that from the margin 24 cents per 100 pounds must be deducted. "There has never been any cost of refining that I have ever

been acquainted with less than one-half cent a pound." When the margin is only 50 cents per 100 pounds, it is a "fair inference" that refineries are running at a loss. Dividends could hardly be paid from profits resulting from such margins, but the witness refuses to state the source from which his company now pays 12 per cent dividends, when the margin is below 50 cents: "We may borrow it." He also referred to existing conditions as ruinous. With the margin at 75 cents "it is beneficial * * * there is no great damage done then," but not unless everything is working in concentrated form and in the very best manner. (112, 132, 136.)

Mr. DOSCHER declares that his refinery has been unable to make any profit from refining at the existing margins of from 32 to 51 cents, but he had expected to be able to make "a nice profit" if the margin of between 70 and 97 cents, which existed before his refinery was established, could be maintained. He is not clear as to details of cost or the method of figuring loss of weight from refining. He believes 93 pounds of refined sugar from 100 pounds of raw sugar a better estimate than 92. From the same quantity of raw sugar about 2 gallons of syrup, worth about 12 cents a gallon, are obtained. Because of the risk of the sugar business the witness thinks a refinery should earn from 12 to 20 per cent yearly on its cost. (88, 93, 94, 97.)

Mr. POST submitted the following estimate, prepared by the general manager of National Sugar Refining Company. This shows that the cost of refining, including the revenue tax of 4.799 cents per 100 pounds, amounts to about 35 cents, while the loss of weight in refining amounts to 28 cents; total, 63 cents, as the necessary margin. The cost has not substantially changed within 5 years. Large refineries, such as those of Havemeyer & Elder, with 12,000 barrels capacity, and Spreckels, with 8,000, could probably produce at from 3 to 5 cents less. (150, 151.)

¹ Sugar in sirup? See Mr. Doscher's different statement above as to sirup obtained.

Mr. ATKINS, who sold his refinery to the American Sugar Refining Company about 12 years ago, states that at that time the cost of refining sugar was estimated at about one-half cent per pound. If the combination has succeeded in reducing this by 25 per cent, it would be doing exceedingly well. Besides the bare cost of refining, labor, fuel, char, etc., account must be taken of the cost of packages, insurance on goods, interest on borrowed money to conduct the business, etc. The witness thinks that the American Sugar Refining Company is producing as cheaply as it is possible to do, and doubts whether any competitor could succeed against it. (806, 807, 811.)

IV. CAPITALIZATION AND VALUE OF REFINERIES.

To understand the cost of refining and the profits of the sugar combination, it is further necessary to consider the cost of refineries and the relation to the existing capitalization of the trust—\$75,000,000. Several witnesses testified that the cost of a refinery sufficient to produce 3,000 barrels per day would be somewhere between \$1,500,000 and \$2,500,000, including the cost of ground. This, of course, has no reference to the value of the plants already erected, including good will, etc.; nor does it take into account the running capital necessary to conduct business.

Mr. HAVEMEYER testifies that the capital of the trust when first formed was \$50,000,000. The capital stock of the various companies which entered the trust was given by Mr. Searies before the New York trust committee at \$6,590,000. But their capital had little to do with their assets or real value. Some of them were worth \$15,000,000 or \$20,000,000 and were capitalized at \$300,000. A committee of appraisement fixed the respective values, taking plant, location, trademarks, status of business, and all considerations into account. The witness be-

believes the trust is now capitalized at much less than its real value. He knows of no better estimate of what a thing is worth than what people are willing to pay for it in cash. The cost of building refineries for an output of 45,000 barrels per day would be perhaps \$30,000,000 to \$35,000,000, but the brand of Havemeyer & Elder would bring as much alone. The value of brands and good will must not be overlooked. The various plants were bought at what they could be obtained for. On its being pointed out that most of them were losing money and worthless under conditions then existing, the witness said that they were "not worthless under the conditions that were about to prevail." If a refiner feels that his plant is worth \$1,000,000 to him, he may offer it to the trust for \$2,000,000, and it may be accepted because more money can be made by buying the plant than by leaving it out. It is fair for consumers to pay dividends on good will—fair, indeed, to get out of them all you can. (111, 123, 124.)

Mr. DOSCHER believes a good refinery will cost about \$2 per pound of daily capacity. Aside from land, a refinery of 1,000,000 pounds (3,000 barrels) capacity could probably be built for about \$1,500,000, but not for \$1,000,000. Refineries must be built on water fronts, which are expensive. The ground for the witness's refinery is worth probably \$300,000. Mr. Doscher owned the Brooklyn Refinery at the time of the formation of the trust. He received for it \$3,000,000 in trust certificates, which was, he thinks, no more than its value. The North River Refinery took cash instead of an offer of double the amount in trust certificates. (91, 92, 100.)

Mr. HAVEMEYER, in reply to a question as to the possibility of building refineries of 3,000 barrels capacity at \$1,500,000 each, maintains that the man who made that statement would want to make about 50 per cent on his stock. He does not believe such a thing could be done. (111, 117.)

Mr. JARVIE estimates the cost of an up-to-date refinery of 3,000 barrels daily capacity at \$2,000,000, exclusive of "real estate." (139.)

Mr. POST believes that the Mollenhauer Refinery, capacity 1,150,000 pounds daily, and the National Refinery, capacity 850,000, would each cost about \$1,500,000 or \$1,700,000, besides land, which would vary from \$250,000 to \$600,000. But each refinery needs, to carry stocks of raw sugar and credits on refined sugar, about \$2,000,000 running capital. The smallest quantity of raw sugar for two such refineries would be 30,000,000 pounds—15 days' supply. This running capital, owing to short credits, could probably be turned over from 4 to 6 times yearly. If such a refinery had a capital stock of \$2,000,000 a dividend of 20 per cent would be only 10 per cent on the real investment, which the witness thinks is little enough in view of the risk. A higher profit might be made, especially by fortunate purchases of raw sugar, or vice versa. (151, 152, 160.)

V. ECONOMIES OF COMBINATION.

A. Continuous operation at full capacity.—The most important saving by the combination of sugar refineries is the continuous operation of the best plants at the full capacity. While 18 refineries joined the trust only 6 or 7 of them are now operated, some having been dismantled and others kept ready for use in case of fire or other emergency; yet more sugar is refined than before. Mr. Doscher states that among those which were closed were: Donner & De Castro, North River, Oxnard Brothers, Moller & Sierck. They were all old plants and all in the vicinity of New York. (HAVEMEYER, 109, 110; DOSCHER, 99.)

B. Large refineries.—Mr. DOSCHER maintains that a large refinery has some advantages in economy of manufacture, but believes that the cost of refining in his establishment, which has a capacity of about 3,000 barrels per day, is as low as in any other, although he does not possess exact knowledge. (88-91.)

Mr. POST submitted a statement showing that the total cost of refining of the National Sugar Refining Company is about 63 cents per hundred pounds. He believes that large refineries, such as those of Havemeyer & Elder, with 12,000 barrels daily capacity, and the Spreckles Refinery, with 8,000 barrels, could probably produce at from 3 to 5 cents less. (150, 151.)

C. Processes.—Mr. DOSCHER claims that there are no special secret processes, but Mr. HAVEMEYER says that, though the general processes of all sugar refineries are the same, yet by combining the ability and experience of different men, advantages are gained. Mr. Doscher adds that the most marked improvements in methods in this country were made from 10 to 15 years ago, but other improvements are being made continually. (Doscher, 91; Havemeyer, 110.)

D. Transportation.—Mr. HAVEMEYER testifies that refineries do not dare to take rebates under existing laws. The former practice was to give the American

Company whatever facilities for storage at terminal points were available, without charge. But recently there has been opposition to this by outside warehouses, and facilities have been much restricted, which the witness thinks very unjust. The trust has agreed with the railways out of New York for a division of sugar freight according to a percentage fixed by a committee of the roads. The schedule of percentages of different roads is given.

There is little advantage from adjustment of transportation except to points in the immediate vicinity of the refineries. The trust operates one refinery in New Orleans and one in Boston, the others being in New York. (110, 112.)

Mr. DOSCHER states that his refinery gets no rebates from railways, but has the privilege of free storage at terminal points, a privilege which Mr. Doscher thinks large shippers of all kinds probably get. The company sometimes has from 2,000 to 4,000 barrels thus stored for as long as 30 days. (90.)

E. Cost of superintendence.—The saving in this is inappreciable, but the saving of labor by concentration in a few plants is important. (HAVEMEYER, 110.)

VI. EFFECT OF COMBINATION ON LABOR.

Mr. HAVEMEYER deprecates the alleged attempt of Colorado ore smelters to coerce workmen by threat of closing certain smelters, supplying demand from others in the combination. When the Sugar Trust was formed economy of production compelled the closing of many refineries, and many men were undoubtedly deprived of employment; but that is one of the conditions of trade which there is no human way to prevent. The labor employed in sugar making is almost exclusively the lowest grade of unskilled labor, largely Poles and Bohemians. Wages are from \$1.35 to \$1.50, but not one of the men could earn as much outside of the refinery. There are no strikes. The men do not belong to unions. The conditions of labor are not unhealthful or severe. The heat is normally about 90; the vapors are beneficial to the lungs. The company furnishes beer at cost to prevent men from going away from work to get it; it is necessary on account of the heat. The hours of labor are 8 in summer and 10 in winter. (122, 129.)

Mr. Post holds that sugar laborers work under more favorable conditions than 5 to 7 years ago, and receive from 3 to 5 cents an hour more. The wages for the cheapest labor are from 15 to 18 cents per hour, and the average duration of work is 10 hours. Temperatures are not excessive except in the filter house, and there for only 2 or 3 hours a day. Workmen are largely German and Irish. (161.)

VII. RAW SUGAR.

A. Production.—From the table of production of raw sugar by countries for 1894-1898, submitted by Mr. Havemeyer, it appears that the crop of cane sugar for the year 1897-98 was 2,537,571 tons; beet sugar, 4,825,520 tons. The largest producers of cane sugar are, in order named, Java (623,000), Louisiana (345,000), Cuba, Hawaiian Islands, Philippine Islands, and Brazil. The chief beet-sugar producers are Germany (1,852,857 tons), Austria (831,667), France and Russia, each with slightly less production than Austria. The production of raw sugar has recently failed to keep pace with the demand, chiefly owing to the war in Cuba and the Philippines. After from 6 to 10 years, normal production over the world will probably increase sufficiently to bring down the price one-half cent a pound. During the disturbances in Cuba and the Philippines raw cane sugar has been largely obtained from Java, West India Islands, Demerara, and Hawaii, and beet sugar from Germany and Austria especially.

Sugar can be grown much more cheaply in Cuba than in this country. Wages there were formerly only 60 to 70 cents daily, but under existing exceptional circumstances are \$1.25 to \$1.50. Cuba before the war produced 735,000 tons (1,000,000, according to Mr. Post), and if annexed could soon supply the entire demand of the United States at 2 cents a pound for raw sugar. (HAVEMEYER, 104, 107, 113; Post, 152, 159, 160.)

B. Beet sugar.—Mr. Post testifies that the product of beet sugar in the United States was 41,000 tons in 1897, 34,000 tons in 1898, and estimated at 123,000 tons in 1899. Of this latter amount Michigan will produce 32,000 and California 54,000 tons. Michigan and New York grant bounties which have greatly increased production. The Michigan law has been interpreted as guaranteeing a bounty for 7 years. If raw sugar were imported free of duty, the beet-sugar industry would be completely destroyed in 5 years. (164.)

C. Effect of combination on prices.—According to Mr. POST, the American Sugar Refining Company, owing to its large consumption of raw sugar, does tend to depress its price, but can not affect it more probably than one-sixteenth cent, and only during certain periods of the year. The production of beet sugar in Europe chiefly determines the price. The cane crop is marketed mainly from January to April. The American Company avails itself of its immense capital to lay in a large supply at that time, when the pressure of producers to sell is greatest and prices lowest. (153, 158.)

Mr. HAVEMEYER admits that the American Sugar Refining Company has some advantage over its competitors in being able to combine different raw-sugar markets. (107.)

VIII. TARIFF ON SUGAR.

A. Rates.—The act of July 21, 1897, paragraph 209, fixes the duty on sugar not above No. 16 Dutch standard in color, if not testing above 75 degrees by the polariscope, at 0.95 cent per pound, with 0.035 cent per pound additional for each additional degree of test. On sugar above No. 16 Dutch standard, or refined, the rate is 1.95 cents. On molasses, 3 cents per gallon if testing between 40 and 56 degrees; above 56, 6 cents. The raw sugars most commonly used for refining vary from 94 to 97 degrees, 96 being considered best. The duty at 96 degrees is 1.685 cents. The Treasury Department estimates that it requires 108.1 pounds raw to make 100 pounds refined. The duty on this amount of raw would be \$1.82148. (BUYNITSKY, 44-46.)

B. Differential duty on refined sugar.—In estimating the amount of protection to American refiners from the duty on refined sugar, the amount of refined obtained from a given quantity of raw sugar is decisive.

Mr. BUYNITSKY testifies that prior to 1898 the Treasury Department estimated that 92 pounds of refined were obtained from 100 pounds of raw. Improvements are continually being made by which a larger proportion of refined is obtained, especially by making new combinations of raw sugars of different degree. Such changes in production had probably made the Treasury estimate too low some time before it was raised, in 1898, to 92½. Mr. Buynitzky has been misrepresented as to his statements before a committee of Congress, but did suggest that he preferred 93 as a safer basis, believing that the rate should be established sufficiently high to anticipate improvements likely to be made in a short time. Nevertheless, he considered 92½ as safe enough. The actual quantity varies with different kinds of raw sugar from 90 to 94 pounds, sugar from Louisiana giving the highest results. The calculations are very intricate.

Taking the Treasury Department estimate that 108.1 pounds of raw sugar at 96 degrees are required to produce 100 pounds refined, the tariff on that amount of raw sugar would be \$1.82148, making the differential duty, or protection to American refiners, 12.852 cents per hundred pounds, since the tariff on refined sugar is \$1.05. (46-49.)

Mr. POST believes that the actual differential duty is more nearly 15 or 17 cents than 12½ cents per hundred pounds. Mr. DOSCHER also estimates that a production of 93 pounds of refined sugar from 100 pounds of raw sugar is more nearly correct than 92 pounds. (Post, 157; Doscher, 93.)

C. Sufficiency of protection.—Opinions differ as to the sufficiency of this differential duty to protect American refiners and as to its effect on prices and consumers.

The rate of protection, according to Mr. HAVEMEYER (assuming the differential to be one-eighth cent per pound), amounts to 3½ per cent ad valorem, and does not cover the difference in the cost of refining between this and foreign countries. He advocates an increase to one-fourth cent, or 8 per cent. The actual difference in cost of refining between the United States and Europe is probably between 0.12 and 0.15 cent. To be sure, no sugar is now imported, probably, so that American refiners do not at this immediate time suffer from foreign competition, but this is because local competition has cut the margin below profitable rates and below the point of importation. Nevertheless, if the present duty were removed it would kill the sugar industry, permitting America to become the dumping ground of European beet sugars. An increase of tariff would not help refiners at the present moment, but is sought "for contingencies." If a reasonable profit, which the witness puts at one-fourth of a cent per pound, were secured, foreign sugar would be imported. (103, 106, 115, 130, 136.)

Mr. JARVIS practically agrees with Mr. Havemeyer, holding that if the margin of difference between raw and refined sugar now prevailing should be raised to a remunerative figure there would be foreign competition. The general feeling among sugar men is that the existing differential of one-eighth cent is insufficient.

The witness believes one-fourth cent would give effective protection. He does not know whether increase in tariff at present would reduce competition at home or make business more profitable. It would depend on trade conditions. Domestic competition would not be increased by increasing the tariff nor decreased by taking off the present differential. The immediate effect on foreign competition of removing the present tariff is not certain. (143-145.)

Mr. POST also partly agrees with Mr. Havemeyer, although he believes the actual differential is more nearly 15 or 17 than 12½ cents. If prices were at a proper point sugar would be imported. The importation point varies according to the surplus stock in Europe; European producers may sell in the United States at less than their home prices. The cost of production in Europe is probably 15 to 20 cents less than here. But constant changes in tariff unsettle business and injure the country, and unless conditions abroad change the tariff on sugar should not be increased. Domestic competition would probably not be affected by raising the tariff. (157, 162.)

Mr. BUYNITSKY does not believe the differential duty on refined sugar has injured American consumers. Under that very slight protection refineries have grown and by their success have reduced prices. But if abuse should arise through excessive prices, the President might be authorized by Congress to reduce the duty by executive order. (49, 50.)

Mr. ATKINS, an importer of raw sugar and a former refiner, pointed out that, while the tariff on raw sugar amounts to over 50 per cent ad valorem, the extra duty of 12½ cents a hundred on refined sugar, which he believes to be "the protection the refiner gets," amounts to only 3½ per cent ad valorem, if the price be taken at 8½ cents. The amount of this small duty can scarcely affect the price to the consumer. The sugar refiner gets no advantage from the duty on raw sugar. (806, 807.)

D. Comparative cost of refining.—The effect of the differential duty on refined sugar, of course, depends upon the comparative cost of refining in this country and in Europe. The various witnesses agreed that the cost is considerably cheaper in Europe, largely because refined sugar is made directly from the beets, without a second process, thus saving the use of the boneblack, which is expensive. The cost of labor is also less.

Mr. HAVEMEYER and Mr. POST testify also that the bags which are used for holding sugar abroad are less expensive than barrels, which are used here, although the smaller bags, which are sometimes used in this country, cost about the same as barrels. Mr. JARVIE does not believe that the use of bags is materially cheaper, since they have to be made very heavy and since there is considerable waste from them.

The cost of transportation to the United States is insignificant, since sugar, which is conveniently packed, is carried for ballast. England can refine sugar as cheaply as any country, and formerly refined 2,000,000 tons annually. But the competition of beet sugar has ruined the business and cut down the product to 1,000,000 tons.

The estimates as to the difference in the cost of refining in favor of Europe vary from 12 to 20 cents. (Jarvie, 142, 146; Post, 153; Havemeyer, 132, 133.)

E. Effect of tariff on raw sugar.—1. *Excessive protection.*—Mr. HAVEMEYER declares that the present tariff of \$40 per ton on raw sugar amounts to giving that much bounty to producers in Louisiana and the Hawaiian Islands, reaching about \$24,000,000 annually. He implies that the cost of production is only about 2 cents per pound. He argues that producers of raw sugar, since it is an agricultural product, should be given no protection, but on being pressed does not object to giving them moderate protection. These domestic producers furnish about 25 per cent of the raw product, and apparently, from the witness's testimony, much of it comes in competition directly with the refined products of the American Sugar Refining Company. The price of refined sugar, and the margin between it and raw sugar, are regularly depressed during the season of Louisiana output. (102, 108, 120, 131.)

Mr. ATKINS, an importer of raw sugar, declares that the present duty on raw sugar affords unnecessarily high protection to the domestic producer. It has been established primarily at the instance of the producers of beet sugar, and is having the effect of building up that industry, but the witness considers that this is done at an unjustifiable expense to consumers, in view of the cheapness with which sugar could be obtained, if there were no duty, from Cuba and other outside sources.

The witness considers the high duty especially unjust to consumers in view of the comparatively small proportion of the raw sugar consumed in this country.

which is produced here. He submitted the following table, showing the sources of our sugar supply:

Consumption and supply.

	Tons.
Consumption of sugar, United States, 1898.....	2,047,000
Sources of supply on basis of crops of 1898-99:	
Domestic cane.....	235,000
Domestic beet.....	33,000
Total (protected by present tariff).....	268,000
Free foreign sugar:	
Hawaiian Islands.....	240,000
Porto Rico.....	55,000
Total (no duty).....	295,000
To have advantage under reciprocity treaties:	
Trinidad.....	50,000
Barbados.....	45,000
Jamaica.....	27,000
British Guiana.....	105,000
Total (supposed duty, 1.35 cents).....	227,000
Subject to full duty:	
Cuba.....	300,000
Java.....	605,000
Philippines, export.....	60,000
Egypt.....	90,000
Santo Domingo and other West Indies.....	70,000
Brazil.....	165,000
Total (duty, 1.685 cents).....	1,380,000
Total.....	2,170,000

Owing to the small proportion which the domestic product itself bears to the total consumption, the producers of domestic sugar are able to get the full advantage of the duty—that is, the price is fixed by the foreign product plus the duty, competition between different domestic producers having no tendency to reduce the selling price. The witness estimates that the profit or surplus price which the producers of this country and of Hawaii, and also those of the British colonies which receive a reduction of duty, gain through the tariff, at the expense of the consumer, is \$22,337,910. The method of reaching this result is shown in the following table:

Domestic production, 268,000 tons; estimated average, 96 test: duty at 1.685 cents per pound=\$37.74 per ton.....	\$10,114,320
Sandwich Islands, 240,000 tons; estimated average, 95 test: duty at 1.65 cents per pound=\$36.96 per ton.....	8,870,400
Porto Rico, 55,000 tons; estimated average, 89 test: duty at 1.44 cents per pound=\$32.25 per ton.....	1,773,750
Trinidad, Barbados, and Jamaica, 122,000 tons; estimated average, 89 test; duty at 1.44 cents=\$32.25 per ton, \$3,934,500; supposed 20 per cent rebate.....	786,900
British Guiana (Demerara), 105,000 tons; estimated average, 96 test; duty 1.685 cents=\$37.74 per ton, \$3,962,700; supposed 20 per cent rebate.....	792,540
Charged consumer for benefit of producer.....	\$22,337,910

Beet-sugar manufacturers, since their product is refined sugar, really receive a still higher protection, the total tariff upon refined sugar being \$1.95 per 100 pounds. Moreover, the beet-sugar factories in this country are mostly located west of the Missouri River, and their product is sold in that region, so that the cost of freight from the seacoast, amounting to about one-half a cent per pound, is an additional protection to their industry. Mr. Atkins further stated that a recent report of the Agricultural Department shows that estimates have been made abroad, in view of the possible competition of the United States in the beet-sugar industry, that granulated sugar should be produced in this country from

beets at 3½ cents per pound. Since the selling price of refined sugar made from the imported product is as high as 5 or 5½ cents, the witness considers that the protection afforded to the American producer is excessive.

The advantage of the high protection to the beet-sugar industry, according to Mr. Atkins, has not so far come largely to the farmer, but has been chiefly absorbed by the manufacturer. Estimates show that the American farmers receive from \$4 to \$4.50 per ton for beets, while the farmers of Germany and other European countries obtain practically the same price.

The effect of excessive protection to the sugar industry is to prevent the development of the best processes, since they are unnecessary in order to secure a profit. Mr. Atkins believes that the American beet-sugar refineries are inferior in their methods to those abroad. Previous to 1890, when the Louisiana sugar industry was highly protected, the methods of production were very rudimentary. When sugar was made free under the McKinley tariff the producers were forced to improve their methods. The same experience has been met with in Cuba and other countries where the price of sugar has declined and has compelled improved methods. The prices which are being obtained in Louisiana, even under the tariff, would have been considered ruinous 20 years ago.

As regards Louisiana sugar, Mr. Atkins believes that the climate is not thoroughly adapted to the production of sugar cane. It is an artificial growth there and never fully ripens. (ATKINS, 803-806, 809.)

2. *Difference in duties between different countries.*—Mr. ATKINS, an importer of raw sugar, testifies that as a result of the war with Spain, with the consequent annexation of Hawaii and prospective annexation of Porto Rico and the Philippines, there will be a great difference in the prices obtainable for raw sugar at the different sources of our supply. Although under previous treaties the sugar produced in Hawaii was imported without duty, the uncertainty as to the future of the islands prevented the development of the industry on a large scale; but since their annexation to this country, and the consequent certainty that the tariff will never hereafter apply to sugar brought from them, large investments are being made by American capitalists and the product is rapidly increasing. So far the Government authorities have held that business with Porto Rico is to be considered as coastwise traffic, and apparently it will not, in the future, be subject to the duty. The same will probably be true of the Philippines. Moreover, treaties have been made with the British colonies in the West Indies and British Guiana, which, if confirmed, will reduce the duty on sugar from those sources by 20 per cent. Unless Cuba is annexed to the United States or unless the duty on sugar from Cuba is repealed, that country will be entirely unable to compete with the other sources of supply. The tariff, amounting to \$1.68 on 96-degree sugar, is such a large percentage of the cost of production, and the cost of production has been so close hitherto to the price received, that no country that is discriminated against by the establishment of duties can possibly compete with countries where the duty does not apply.

In support of this general contention Mr. Atkins has prepared a table showing the prices which could be received by the sugar producers of various countries, in view of the different rates of duty, and of the different freight charges, on the hypothesis that the market price of sugar in New York, duty paid, is 4½ cents. This table shows that sugar imported from Germany would net its producer \$2.71 per 100 pounds; from Cuba, \$2.69; from Java, \$2.46; from the English colonies, on account of the lower duty, \$3.02; from Porto Rico, \$4.28; and from Hawaii, \$4.14. The table on which this estimate is based follows:

Charges.	Germany.	Cuba.	Java.	English colonies.	Porto Rico.	Hawaii.
Duties:	Cents.	Cents.	Cents.	Cents.	Cents.	Cents.
Tariff.....	1.685	1.685	1.685	1.348	None.	None.
Countervailing.....	.259	None.	None.	None.	None.	None.
Estimated freights.....	.080	.100	.300	.100	.180	.270
Insurance on f. o. b. value.....	.020	.025	.050	.028	.032	.060
	2.044					
Less bounty.....	.259					
	1.785					
F. o. b. value.....	2.715	2.690	2.465	3.024	4.288	5.140
	4.50	4.50	4.50	4.50	4.50	4.50
Foreign value above.....	2.71	2.69	2.46	3.02	4.28	4.14

Before the recent insurrection, Cuba was producing 1,080,000 tons of sugar per year. For the last year the crop has been a little over 800,000 tons. There is no capital available in Cuba for investment, and capital from the United States will not be invested there for fear that the island will be made independent of the United States and will be compelled to pay duty upon sugar. Mr. Atkins is doubtful as to the power of the President, without an act of Congress, to conclude any treaty with Cuba by which the duty on sugar may be reduced. The witness does not consider it likely that any duty will be charged, at any time, by act of Congress or otherwise, upon the product of Hawaii, Porto Rico, and the Philippines. If this is the case, Cuban industry, which depends almost wholly on sugar, will be ruined, unless its sugar be freed from duty. This country has a moral responsibility for the prosperity of the island.

Mr. Atkins further believes that the duty on raw sugar is excessive; but this point is developed more fully above, pages 71, 72. (ATKINS, 800, 802, 808, 810.)

F. Countervailing duties.—The effectiveness of the protection afforded to American refiners depends also largely upon the success of the system of countervailing duties levied to offset the bounties paid, directly or indirectly, on the exportation of refined sugar from various European countries.

The act of July 24, 1897, provides that the Secretary of the Treasury shall ascertain the amount of bounty paid for exportation of any article from any foreign country, and shall charge an additional duty on such articles, on their entrance into the United States, equal to such bounty. By the circular dated December 12, 1898, the amount of such bounties on sugar is stated for the Argentine Republic, Austria-Hungary, Denmark, France, Germany, Netherlands, and Russia. Countries paying such bounties on sugar have usually sought to conceal them, generally by paying drawbacks at exportation on the basis of the actual amount exported, while the original tax was levied on the basis of an assumed amount of production, from a measured quantity of beets, which was less than the actual production. The representatives of the various countries appeared before the Treasury Department to influence the decision as to countervailing duties. Russia denied that any bounty was given, but by the method above described the actual bounty is equal to about 25 cents on 36 pounds. Germany, Austria-Hungary, and France now give direct and unconcealed bounties. (BUYNITSKY, 52-54.)

Mr. POST is of the opinion that existing countervailing duties are accurate and satisfactory, and substantially offset the various foreign bounties. (Post, 162.)

Mr. ATKINS points out that in 1897 the consumption of sugar in Germany was 594,000 tons, while the production was three times as great—1,725,000 tons. This great production has been due to the high bounties given by the Government. (810.)

G. Drawbacks.—When sugar or sirup refined from imported raw sugar is exported a drawback is paid equal to the amount of the duty less 1 per cent. A careful calculation is made as to the relative proportion of refined sugar and of sirup obtained from a given quantity of raw, and a drawback is apportioned between these two. By this method a table of drawbacks, according to the degree of polarization of raw sugar, is determined. The drawback on 100 pounds of refined sugar made from 96-degree raw sugar is \$1.70. The rate on sugar made from beets varies slightly. The drawback on sirup valued at 8 cents per gallon or less is 1½ cents; from 8 to 14 cents, one-half the value of the sirup; above 14 cents, 7 cents per gallon. The values named are those in the tank at the refinery without further treatment or rectification. (BUYNITSKY, 44-46, 51.)

LIST OF WITNESSES.

	Page of testimony.
Bradley, Edson, president, American Spirits Manufacturing Company and vice-president Distilling Company of America	813-831
Clarke, Charles C., independent distiller, Peoria, Ill.	167-192
Cook, Martin R., wholesale liquor dealer and distiller, New York City	240-250
Luyties, Henry E. G., wholesale liquor dealer and distiller, New York City	250-259
McNulta, John, receiver of the Distilling and Cattle Feeding Company	192-240
Rice, Samuel, president Distilling Company of America	831-848

I. DESCRIPTION OF BUSINESS.

The whisky business is divided, roughly speaking, into three great branches—(1) the distillation of alcoholic spirits; (2) the rectification of such spirits into whiskies and other liquors and their distribution; (3) the distillation of "straight" whisky, which is rendered fit for use only by aging. The chief branches of the latter trade are the distilling of Bourbon whisky in Kentucky and of rye whisky, which is chiefly confined to Pennsylvania and Maryland.

A. Spirits.—The undiluted product of the distillation of corn is alcohol. When refined through charcoal commercial alcohol becomes known as pure spirits. A slightly different form of pure spirits is known as high wines, which was the former basis for the quotation of prices, the present basis being "proof spirits"—that is, spirits reduced to a proportion of one-half alcohol. "The term high wines was more descriptive of a kind of product, and prices were based after all upon proof gallons;" so there has been no essential change in the basis of quotation. Alcohol is chiefly used in the arts. Spirits are used largely in making colognes and essences and in blending to make cheaper grades of whiskies, gins, etc. Out of a total annual production of about 93,000,000 gallons of spirituous liquors, only 20,000,000 gallons are rye and Bourbon whisky, the remainder being alcohol, spirits, or rectified whisky. (CLARKE, 168; McNULTA, 204, 205; LUYTIES, 258; BRADLEY, 827.)

The residue from distillation is an exceedingly important factor in the business. That remaining from 1 bushel of corn is sufficient to feed 1 head of cattle 1 day. By a recent invention, which is being used largely in Germany and to some extent in this country, this residue, instead of being fed directly to cattle, is dried and baled. This is advantageous because constant operation in order to supply cattle is not necessary, and the residue can also be used "in summer, when the cattle can not be fed on slops." (LUYTIES, 258, 259.)

B. Rectifying and compounding of whiskies.—A considerable proportion of pure spirits are used in the preparation of cheap grades of whiskies, gin, etc., which can be used immediately without aging. This process is largely carried on by what are known as rectifying houses. These houses are also often referred to as "distributers," because it is through them that the spirits reach the wholesale trade.

Mr. RICE testifies that pure spirits are to be considered as raw material. There is no difference in quality, and practically no demand for the great bulk of the output except in a modified form. The price, therefore, of pure spirits depends absolutely on the price at which the rectified product is sold. The business of distributing spirits may be considered more profitable than that of distilling, because of the valuable trade-marks and brands which are often connected with the rectified product. It is for this reason that the whisky combination has sought to bring in the business of rectifying and distribution. (835.)

The process of compounding and rectifying was described in some detail by Mr. CLARKE. He stated that the pure spirits, reduced sufficiently in strength, are mixed with brown sugar and other coloring substances, and flavored with various proportions of high-priced old whisky and with other materials. The witness knows of no harmful materials used, but the proportion of old whisky used varies greatly, and the cost varies accordingly. If 10 gallons of old whisky, worth about \$2.25 per gallon, are used with 40 gallons of pure spirits, worth \$1.30, the cost of the product, including 5 cents for other materials, would be \$1.60. If the proof be reduced from 100 to 60, as is sometimes done, the cost would be 96 cents. Another form of cheap whisky is made without old whisky, and with the proof of 90 can be made for \$1.23 per gallon. Most whisky sold over the counter, except by druggists, is rectified whisky. (179, 180.)

Mr. McNULTA, after studying carefully the compounding processes of the Distilling and Cattle-Feeding Company, especially in the Shufeldt distillery, believes that the adulteration of whisky is purely imaginary. The basis is high-proof

spirits, which is simply refined alcohol, with just enough water to hold it in liquid form. To this, to make whisky, only brown sugar, glycerin, and prune juice are added. There is nothing that can be substituted for the spirit, which is itself exceedingly cheap. Whisky thus made is perfectly pure, and though unpalatable at first, improves by age. Gin is made at the Shufeldt distillery by a secret process in which juniper berries and other vegetable materials are added to pure spirits. The process is as satisfactory as that used in Holland. (204, 205, 236.)

C. Kentucky and rye whiskies.—These whiskies, which are chiefly used for beverage purposes, are made fit for use only by aging, usually for a number of years, during which time generally the tax is not paid, the goods being held in bonded warehouses. The distillation of these whiskies is quite closely confined in locality, and their sale depends almost altogether on the name of the brand. The prices are much higher usually than for staple or rectified whisky. (BRADLEY, 827, 829; RICE, 836, 837.)

II. HISTORY AND DESCRIPTION OF COMBINATIONS.

Introduction.—The various combinations in the whisky business have been so numerous and so intricately related that it is not easy always to understand the references made by the various witnesses.

Aside from the early pools, the first combination was the Distillers and Cattle Feeders' Trust. This was succeeded by the Distilling and Cattle Feeding Company in 1891. The latter was reorganized under the title of American Spirits Manufacturing Company in 1895. All these organizations were confined strictly to the business of spirits, having nothing to do with Kentucky and rye whisky and very little to do with the rectifying and distributing business.

In 1896 the Spirits Distributing Company was incorporated, as a subsidiary to the American Spirits Manufacturing Company, for the purpose of controlling rectifying and distributing houses. In 1898 the Standard Distilling and Distributing Company was organized. It controlled various spirits distilleries, but took in besides many distributing houses.

The Kentucky Distilleries and Warehouse Company was organized in February, 1899, to secure control of the Bourbon whisky business.

Later in 1899 the Distilling Company of America was formed to combine all four of the existing companies above named and to take in also certain leading rye distilleries. This organization was established during the time when testimony on the subject of the whisky combinations was being taken before the Industrial Commission, so that some of the witnesses gave evidence before its organization. This fact must be borne in mind in interpreting the statements of these witnesses.

A. Pools.—The first combinations among distillers, beginning in 1882, were in the form of pools. The number of barrels to be produced by each distillery, and the prices, were regulated by agreement. From 70 to 80 distilleries usually joined, and production was limited to about 50 per cent of their capacity. One of these pools was known as the Western Exporters' Association. It determined the producing capacity of each distillery and divided the consuming capacity of the country pro rata. Distilleries producing in excess were required to export at their own cost, while any surplus arising fortuitously was exported at the expense of the association, the loss being met by assessment. The pools were frequently broken by violation of agreement by members or by new distilleries; there were no penalties. Business became so unprofitable when broken that they could usually be reorganized soon. (McNULTA, 200; CLARKE, 168, 169.)

Mr. BRADLEY stated that the whisky business is one of great booms and depressions, due at times to changes in the law and also to the fact that stocks of whiskies are accumulated. The witness knows of few permanent fortunes that have been made in the whisky business. (828.)

B. Distillers and Cattle Feeders' Trust.—1. *Organization.*—The trust was organized in 1887 by an agreement following the form of the Standard Oil Trust. Sixty-five distilleries first entered the combination. They were all first organized as corporations, and the stock of these was put into the hands of nine trustees, who issued therefor trust certificates. The lists furnished by Mr. McNulta show that trust certificates were exchanged for the shares of the constituent companies in various proportions, running up to more than twenty to one. One or two shares of stock were usually left in the hands of officers of the corporation, to qualify them to be directors, while the remainder were held by the trustees. The trustees had the same control of the separate corporations as if they were actual owners of the stock, though the precise legal powers of the trustees were never

determined, the courts indeed finally holding the method of organization itself illegal. The trustees elected directors for each company, usually consisting of part of their own number and the manager of the distillery, often its former owner, who was paid a salary. Eighteen or nineteen additional distilleries entered the trust in 1888 and two in 1889, making a total of 86. Only 33 of these were running when taken in. (CLARKE, 169, 173; McNULTA, 193-197, 200.)

2. *Capitalization and valuation of plants.*—Testimony differs as to the relation of the capitalization to the actual value of the plants joining the trust. Mr. McNULTA knows of no reliable data as to the method of valuing the plants, except that it was done primarily by the trustees in consultation with the separate distilleries. The trustees were doubtless paid somewhat better for their plants than others. (196.)

Mr. CLARKE holds that trust certificates were issued at the rate of about four times the actual valuation of each distillery. A committee of the trustees made a valuation based on the cost of reproduction, location, and earning power. It was intended that this should be known only to the trustees. The witness knows that his own distillery received trust certificates amounting to four times its valuation. The amount of trust certificates was about \$34,000,000, on which dividends at 6 per cent were paid. (169, 170, 187.)

C. *Distilling and Cattle Feeding Company.*—1. *Organization.*—The trust, fearing court decisions against that form of organization, reorganized as a corporation in 1890. Application for license to incorporate under the laws of Illinois was filed January 30, 1890, and the charter was issued February 12.

The capital stock was \$35,000,000, all but about \$1,000,000 of which was turned over to holders of trust certificates of the Distillers' Trust in payment for all its properties, the remainder being held in the treasury. (Forms of application, license, stock subscription, charter, bill of sale by trust to corporation, by-laws of Distilling Company, and record of first meeting of stockholders and election of directors are exhibited. Pages 218-224.) No preferred stock was issued. The amount of bonds authorized was \$8,000,000, but only \$1,000,000 were issued. Later \$2,500,000 more were issued as collateral for payment of rebates. The trustees became directors in the new corporation. The separate corporations which entered the trust surrendered their charters and their properties were bought with shares of the new corporation. (McNULTA, 195; CLARKE, 171, 173.)

2. *Dividends and profits.*—The dividend paid by the Distilling Company for the year ending March 31, 1891, was 4 per cent, or \$1,260,053; for 1892, $5\frac{1}{2}$ per cent, \$1,890,022; 1893, $2\frac{1}{2}$ per cent, \$874,876. After this time profits were used in purchasing additional distilleries, about \$4,000,000 being thus invested. The witness estimates that the actual value of the properties could not exceed one-half the capitalization on which dividends were paid. (McNULTA, 216, 238.)

3. *Stock speculation.*—The stock both of the trust and of the ensuing corporation varied in value greatly, from 8 to 70, and was much speculated in. It was proved that the directors of the corporation used its money for buying stocks and protecting margins, nominally in the name of the corporation. They sold stocks as individuals to the company as such at prices above the market, the difference being estimated by the receivers at about \$800,000. Owners of stock in New York and in Illinois investigated the books and applied for receivership in January, 1895, making many charges of mismanagement. (McNULTA, 198; CLARKE, 174, 175.)

Mr. RICE, who was a member of the stockholders' protective committee which was formed at this time, also testifies that it was a matter of general knowledge that Mr. Greenhut, the president of the company, had been speculating in the stock of the company; he has no doubt of the fact himself. (831.)

4. *Illegality under Illinois law.*—In 1894, in the case of Distilling and Cattle Feeding Company v. People (156 Illinois, 448), the court held the company a combination in restraint of trade, attempting to corner the market, and hence illegal under the trust law of Illinois. The judgment was one of ouster in the circuit court. Pending the appeal to the supreme court, the company was put in the hands of a receiver on other grounds, and the final decision was not rendered. It was further held that the transfer of property from the Distillers' Trust to the company was illegal, because payment was made in stock instead of money. (McNULTA, 216, 217.)

5. *Receivership.*—Mr. RICE testifies especially as to the events which led to the receivership of the Distilling and Cattle Feeding Company. The holders of rebate certificates issued by the company had organized a committee in the fear that they would be unable to collect these rebates. This committee hastened the receivership, although it had nothing directly to do with it. The information elicited by it led to the organization of a protective committee of stockholders in

September or October, 1894, which secured proxies for over 300,000 shares out of the entire 350,000 shares of the stock. The officers of the company agreed to meet this committee; but instead Mr. Greenhut, the president, went to Chicago, and, on the application of holders of 1,700 or 1,800 shares of stock, had himself appointed receiver, together with Mr. Edward F. Lawrence, of the First National Bank of Chicago. A few days later, on the action of the stockholders' committee, the court removed Mr. Greenhut and substituted John J. Mitchell, of the Illinois Trust and Savings Company, with Gen. John McNulta to represent the court. Mr. Greenhut was charged with having speculated in the stock of the company. (831, 837.)

Mr. McNULTA's testimony agrees with the statements of Mr. Rice as to the appointment of receivers, giving less detail as to the causes leading to it. He testifies that after March 23, 1895, he himself remained as sole receiver of this company, and in fact is still acting as such, although the business is practically closed up. As receiver he continued to operate the distilleries on a small scale (this being necessary, as Mr. Rice points out, on account of the cattle depending upon the residue). (192, 210.)

6. *Records of trust and company.*—When the receiver took possession in 1895 he found no records of the Distillers' Trust, and believes that they were destroyed. The papers of the Distilling Company were apparently intact, but there was some dispute by the officers, who maintained that the papers in two safes were private and not company records. These safes were forced open and private papers separated from others. (McNULTA, 195, 196.)

D. *American Spirits Manufacturing Company.*—The history of this organization is given with especial fullness by Mr. RICE, its president, and in less detail by Mr. CLARKE and Mr. McNULTA.

It was organized by a syndicate of the stockholders of the Distilling and Cattle Feeding Company, including practically all of the stock. The capitalization of the new company was \$7,000,000 preferred, \$28,000,000 common stock, the total being equal to the capital of the Distilling and Cattle Feeding Company. According to Mr. Rice, the transaction with the Distilling and Cattle Feeding Company consisted simply of a transfer of stock, dollar for dollar, in which the cash value of the plants transferred had nothing to do with the calculation. Mr. McNulta, however, testifies that the properties were sold outright for cash by the receiver to the new corporation, the price being \$10,500,000. The new company levied an assessment on the stockholders of \$4 per share for cash capital, and this, in addition to the \$10,500,000, constitutes a fair valuation of the property secured. The new company assumed all the debts of the Distilling and Cattle Feeding Company, and the receivership expenses.

Mr. Rice confirms the judgment that the value of the properties actually taken over by the American Spirits Manufacturing Company did not exceed \$10,500,000. The number of plants taken was 17, although 80 at least had entered the old Distillers' Trust. These 17 were the only ones which had real value, the remaining ones representing burden. Many had been dismantled.

The American Spirits Manufacturing Company has never paid any dividends, and Mr. Rice, its president, states that he never made any concealment of the fact that it was formerly little more than a wreck. It had been formed chiefly as an agency toward establishing a more wide-reaching combination. Its preferred stock has ranged in value on the exchange from 15 to 40, the common from 5 to 15. No public financial statement of the affairs of the company was made, but at the annual meetings a general statement of its condition was given, while the officers made it a practice to explain its affairs and show the books to bona fide stockholders inquiring concerning them. (CLARKE, 175; McNULTA, 234, 235; RICE, 832, 833, 840.)

E. *Spirits Distributing Company.*—This organization was formed in February, 1896. Its capital was \$1,250,000 of first preferred, \$1,575,000 of second preferred, \$3,675,000 of common stock. All of the common stock belonged to the American Spirits Manufacturing Company, which in fact organized this company as a means for securing control of the distributing business. The subscription to the preferred stock was underwritten by the stockholders of the American Spirits Manufacturing Company. (RICE, 834.)

F. *Standard Distilling and Distributing Company.*—Mr. RICE testifies that this new organization was incorporated about July, 1898, under the laws of New Jersey, with a capital of \$8,000,000 of preferred stock and \$16,000,000 of common stock. The witness has no doubt that the Standard was organized through the efforts of men interested in the American Spirits Manufacturing Company. The new organization sought to bring in certain outside distilleries, which had been established in competition with the preceding combinations, and especially to secure a larger control of distributing houses. Mr. Rice estimates that in 1899 the American Spirits Manufacturing Company controlled about 55 per cent of the output of

spirits, the Standard Distilling and Distributing Company about 85 per cent. The Standard also controls 16 of the largest distributing plants, doing perhaps two-thirds of the entire business. Mr. BRADLEY, however, estimates that the Standard handles half of a total of 85 per cent of the spirits business controlled by the two companies. (814, 835.)

Mr. CLARKE states that the Standard had, before the organization of the Distilling Company of America, an agreement with the American Spirits Manufacturing Company as to the proportion which it should produce, the latter buying whatever product remained over. (176, 178.)

Mr. CLARKE further testifies that he believes the Standard Distilling and Distributing Company to be very much overcapitalized. He believes, from offers made to himself and from general information, that each distillery entering into the company received for each \$100,000 of actually estimated value \$100,000 in cash, \$100,000 in preferred stock, and \$100,000 in common stock, the latter being payable in five annual installments, with provision for forfeiting the balance if the owner again entered the refining business. At the same time, for each \$100,000 of cash advanced by the New York capitalists by whom the enterprise was underwritten, they received an equal amount in preferred stock and \$150,000 in common stock, and the promoters received \$150,000 in common stock; making a total of \$600,000 of stock issued for each \$100,000 in value of refineries. The total amount underwritten was \$24,000,000—the preferred stock \$8,000,000 and the common stock \$16,000,000. (175-177.)

Mr. COOK considers the capitalization of the old trust and the existing corporations as highly inflated. The plant of the witness, recently erected and first class, having a capacity of 4,000 bushels daily, or about one-tenth that required to supply the consumption of the country, has cost \$150,000. Two million dollars of capital ought to produce all the country demands. The Distilling Company was capitalized at \$35,000,000 and the Standard Distilling Company at \$24,000,000. (COOK, 249.)

G. Kentucky Distilleries and Warehouse Company.—In February, 1899, this company was organized with an authorized capital of \$12,000,000 of 7 per cent cumulative preferred stock and \$20,000,000 of common stock, of which there was issued \$10,500,000 of preferred and \$18,500,000 of common stock. A proposition was made to the company to transfer various Kentucky distilleries and brands, together with \$1,500,000 of cash working capital, for the full amount of stock issued. About 90 per cent of the standard brands of Kentucky whiskies were acquired, and a new distillery was established for producing a cheap grade of whisky. (BRADLEY, 818.)

H. Distilling Company of America.—1. *Organization and purpose.*—This company was incorporated about July, 1899. According to the testimony of Mr. RICE and Mr. BRADLEY, its president and vice-president, its authorized capital is \$55,000,000 of 7 per cent cumulative preferred stock, and \$70,000,000 of common stock. Of this, \$31,250,000 of preferred, and \$46,250,000 of common stock, were put in the hands of the organizers or promoters of the combination, the remainder being still in the treasury of the company.

The Distilling Company of America is not itself an operating organization, but was incorporated solely for the purpose of purchasing the stocks of the existing four combinations, and to secure control also of certain rye distilleries. (Mr. Bradley seems not to have had the rye distilleries in mind when he stated that it is not an operating company; it apparently operates them directly.) The stocks which were placed in the hands of the organizers or promoters were sufficient to purchase the entire stock of each of these existing combinations, and the promoters were required to return an amount corresponding to any proportion of these stocks which they failed to purchase and turn over to the Distilling Company of America. As a matter of fact, they succeeded in securing an average of 95 or 96 per cent of these stocks, according to Mr. Bradley; 92 per cent according to Mr. Rice. The promoters were also required to furnish \$1,500,000 of working capital, and a certain amount for the purchase of the two distilleries operated by the Hannis Distilling Company, and of a rye distillery in St. Paul. Mr. Bradley testifies that \$2,000,000 in cash was paid for this property, but Mr. Rice is not clear as to this transaction. The sole source of profits of the Distilling Company of America will be the dividends of the separate companies (except, apparently, the profits of the rye distilleries). These companies will continue to declare dividends, and the minority stockholders who did not turn over their stock to the combination will be undisturbed in profits. The directors of the Distilling Company of America, in their official capacity, will be able, by their control of the stock of the separate companies, to control their various boards of directors.

The proportions of stocks of the Distilling Company of America which were exchanged for the stocks of the four underlying companies differed according to the estimated earning capacity of the various companies. These proportions were as

follows: For every preferred share of the American Spirits Manufacturing Company, 50 per cent in preferred stock of the Distilling Company of America, and for the common stock 25 per cent in common stock of the Distilling Company. For every share of the Kentucky Company, common stock, 70 per cent; preferred stock, 85 per cent in preferred and 15 per cent in common. Standard Company, 85 per cent in preferred and 50 in common for the preferred, and for common stock, 60 per cent in common. The Spirits Distributing Company first preferred, 80 per cent in preferred and 20 per cent in common stock; for the second preferred, 20 preferred and 20 common."

The proportions thus fixed were determined by the committee of organizers, which was influenced by large stockholders in the different companies. The witnesses know little as to this committee.

The persons who subscribed the \$3,500,000 cash received preferred stock to a certain amount, and a bonus of common stock, as is customary in such cases. (Bradley, 819-821; Rice, 832-834.)

2. *Promoters' profits.*—It appears from calculations based on the plan for the purchase of the stocks of the underlying corporations that the total amount of the preferred stock of the Distilling Company of America necessary for this purpose amounted to \$30,540,000, and the total of common stock to \$32,890,000. This leaves in the hands of the organizers or promoters \$10,710,000 of preferred and \$13,800,000 of common stock. These amounts of stock were employed for securing the \$3,500,000 cash for working capital and for purchasing the Hannis and St. Paul establishments. Neither Mr. Rice nor Mr. Bradley apparently knows the actual amount of stock which was employed for these purposes. Whatever remainder there was, and Mr. Rice admits that it was perhaps large, went to the promoters as payment for their services in organizing the combination. Mr. Rice states that he would not be willing to sell the rye distilleries which were purchased for less than \$5,000,000 in cash. The organizers undertook a very important piece of work, which was believed to be almost impossible, namely, the securing control of the stocks of the four different companies. The accomplishment of this object is of very great value and advantage to the stockholders, and they could well afford to pay largely for the work. (BRADLEY, 820-822; RICE, 838-840.)

3. *Capitalization and fixed charges.*—The total preferred capitalization of the four constituent companies which entered the Distilling Company of America was \$28,325,000. The preferred capital so far issued by the new company amounts to \$31,250,000. The rates of interest on the preferred stocks of the older companies vary, but average less than 7 per cent, the rate on the new preferred stock. The fixed charges, according to Mr. Bradley, have been increased about \$250,000 per year. The preferred stock of the Distilling Company of America was selling in October, 1899, at about 43, the common at about 14.¹ (BRADLEY, 822; RICE, 838.)

¹ The following table, compiled from current stock quotations, shows the market price of the "Whisky Trust" stocks. The quotations are on the trust certificates of the Distillers' Trust down to 1891; then on the Distilling and Cattle Feeding Company to August, 1895; on the American Spirits Manufacturing Company to July, 1899; and since on the Distilling Company of America. For history of changes of organization, see above.

A. New Jersey corporation laws obeyed.—Mr. BRADLEY testifies that each of the four companies now united under the Distilling Company of America keeps a regular transfer office in the State of New Jersey. Mr. Garretson, of Jersey City, is the agent of three of them, and Mr. Vickers, of Jersey City, of the fourth. The witness understands that duplicates of the certificate and transfer books are kept in these offices; that the names of the companies are conspicuously posted, and that the law is generally complied with. Mr. Bradley has not personally seen these books since he has been an officer of the company. (823, 824.)

III. EFFECT OF COMBINATION ON OUTPUT, COMPETITION, AND PRICES.

A. Early attempts to control output.—Several witnesses testify to the fact that the whisky business, especially the distilling of spirits, is one in which there is a marked tendency toward overproduction. The profits of the business are very great where the prices are reasonable, and the cost of establishing a distillery is slight. The great excess of producing capacity is assigned as the chief cause which forced the organization of the original trust. The various combinations have found competitors constantly arising, and have avowedly sought, in various ways, to control the output. The policy as to prices and the success of the combinations in their efforts to control them have varied greatly at different times.

1. General policy.—Mr. McNULTA testifies that it was the object of the Distillers' Trust and the Distilling and Cattle Feeding Company to obtain entire control of the market, limit the output, and establish extortionate prices. This policy failed, provoking prompt and large competition. (217.)

By comparing statistics of production of spirits prepared by the Commissioner of Internal Revenue and of production by the Distilling Company for 5 years, 1890 to 1894, it is found that the total produced was 548,492,834, of which the Distilling Company produced 214,597,314 gallons. But the former statistics include all classes of spirits which do not compete with the high wines or pure spirits manufactured by the combination. (McNULTA, 215.)

Mr. CLARKE states that at first the trust controlled about 95 per cent of the total production of spirits. It at once raised prices so as to secure a profit of about 5 cents per gallon. New refineries were erected in competition, and it was found impossible to maintain this high scale of prices. (171, 176.)

Mr. COOK states that the first effect of combination was to make prices more regular, and the rates at the outset were moderate. Later on the trust advanced prices to excessive figures and demoralized the entire business. Shortly before the failure of the Distilling Company the price was advanced about 20 cents per gallon within 30 days. The witness is not certain whether the trust attempted to fix the prices at which distributors should sell to dealers. It did seek to control the market and prices, preventing competition and reducing output. (241-246.)

2. Closing of distilleries.—Mr. McNULTA states that the Distillers' Trust in order to restrict output closed a large proportion of its distilleries, especially the smaller houses, in many cases taking out the machinery. In order to keep men

from reentering business, the ground on which the distillery stood was leased by the trust for 20 or 25 years at 6 per cent on the estimated value. When the company went into the hands of the receiver, he refused to pay further rentals and the ground reverted to the original owners, the court holding the contract void as a restriction of trade. In certain cases, notably that of the Clarke Distillery, at Peoria, the buildings had been rented to the original owners with the contract that they should not be used for distilling spirits, but only rye whisky. The Clarke Distillery began to make spirits, but was restrained by order of court on application of the receiver.

The trust also contracted with the owners in many cases to pay them salaries (usually \$300 per month) as managers for 5 years, whether operating or not. After 5 years most of these contracts were discontinued.

"They threw away property that cost them hundreds of thousands of dollars merely to eliminate it; they paid men for staying out of the trade; they paid rent on this abandoned land right along from year to year, nearly \$100,000 a year, * * * in order to put them out of the way." (203, 216, 238.)

Mr. CLARKE confirms this testimony in its general statement of facts. He says that only 10 or 12 of the 80 distilleries which entered the trust were operated, and yet the output was still kept large. (170, 185, 190.)

Regarding the closing of his own distillery at Peoria, Mr. Clarke admitted that he had sold out to the trust. He stated that after doing so he leased one of the trust's old establishments, which was not operating, and went into the rye-whisky business, which did not compete with the combination. In 1897 (after the time referred to by Mr. McNULTA) he leased still another of the old trust plants and went into the spirits and alcohol business again. The Standard Distilling and Distributing Company tried to buy this establishment through Mr. Clarke, but having failed to do so bought it directly from the owners. (185.)

Mr. RICE declares that the great majority of the distilleries which entered the combination were a mere burden upon it, being badly located and uneconomical. They were taken simply to prevent their acting as a disturbing factor in the business, as they might do in spite of the fact that they could not produce at a profit. (832.)

8. *Purchase of distilleries.*—Mr. McNULTA testifies that the Distillers' Trust and the succeeding companies found it continually necessary to buy up competing plants which were established. Frequently those who joined the trust sold their trust certificates or stocks and built new competing distilleries, sometimes selling out two or three times and violating agreements not to produce further. In one case officers of the company bought from the owners four distilleries in Nebraska, St. Louis, and Peoria, selling them again to the company at an advance of \$290,000, the receiver afterwards suing to recover this difference. The Nebraska distillery had previously been sold for \$10,000 with a guaranty that it should not be used for distilling purposes. This agreement being violated, it was rebought for \$410,000. (197, 198, 207, 208.)

Mr. CLARKE adds that very high prices were often paid for the plants which the combination found it necessary to buy. The rebate fund of the distilling company was used for this purpose. (170, 172.)

The witness adds that notwithstanding the dismantling of distilleries by the trust, the producing capacity of the distilleries in the country is probably double the amount of consumption. Present statistics as to the amount of production, however, are misleading, because before the increase of the tax to \$1.10 the tax was paid on enough spirits for three years' consumption at the lower rate. (245-247.)

4. *Special cuts in prices.*—Mr. CLARKE and Mr. LUYTJES state that it was the practice of the Distillers' Trust and the later combinations to send agents into special localities to undersell competitors, their particular customers being approached and offered open or secret cuts in prices. In this way distilleries were usually forced to sell out to the trust. That, indeed, has been and is the common practice on both sides.

Mr. McNULTA, as receiver, found that a competitor was underselling in California, and openly cut below his rate to his customers. "When a man produces goods and sells them below cost of production he is not doing a fair business, and the only way to make him do so that I know of is just simply to cut a little below him." By this process this competitor and others were induced, for several months during 1895, to make a joint agreement to maintain prices fixed from day to day by the receiver according to the price of corn, allowing 1½ or 2 cents profit. This arrangement was temporarily broken by a competitor who invested on the short side in the distilling company stock, and cut prices in order that the stock might go down, but by still lower cuts on the part of the receiver he was induced to come back again. (208-210.)

Mr. Clarke testified in May, 1890, that both the combination and outside distilleries were making secret cuts in prices, so that the actual prices received were 3 or 4 cents below those quoted. (181.)

Mr. Layties declares that the severe cuts were made to attack the new Terre Haute distillery in 1890. Competition by a trust is the most severe possible, because its officers often have a relatively small financial interest and need not pay dividends. Owing to the excessive prices which it has paid for its properties it naturally resents competition the more bitterly. (253, 254.)

B. Rebate system.—1. *Early system.*—Several witnesses describe the rebate system established originally by the distillers' trust, but more fully developed by the Distilling and Cattle Feeding Company. It appears to have been distinctly a device for holding trade exclusively.

Mr. McNULTA, receiver of the distilling company, testifies that it was the practice to sell its products altogether through distributors. To these a rebate of 2 cents, which had already been established under the trust, was paid, for which no voucher was issued. Anyone might become a distributor who purchased a sufficient number of carloads per month. The company fixed its price to them, but they fixed the price to the wholesale dealers. The latter were allowed a 5-cent rebate from May 25, 1890, to November 25, 1891, and thereafter 7 cents up to September, 1894. The distributors sent lists of sales to the company, which issued vouchers to the purchasers, payable in 6 months. Rebates were granted only where the trust's product was used exclusively, and were intended to enable it to control the market. Nearly all spirits sold, as shown by statistics, bore a rebate. The total amount of rebates, less amount refunded, for the years ending March 31, were as follows: 1892, \$3,235,031; 1893, \$3,685,146; 1894, \$2,819,183; ten months ending January 31, 1895, \$1,087,502. The form of rebate voucher follows. (206, 207, 210, 211.)

[Face of voucher.]

PEORIA, ILL., ———, 189—. No. ———.

Subject to the conditions named herein, and for the purpose of securing the continuous patronage of the within-named purchaser, the successors and assigns of the same, for its products, the

DISTILLING AND CATTLE FEEDING CO.,

Six months from the date of this purchase voucher,

Will pay to ———, of ———, purchaser ———, ——— dollars (\$——),

Being a rebate of 7 cents per proof gallon on ——— proof gallons of the Distilling and Cattle Feeding Company's product purchased this day. This voucher will be valid and payable only upon condition that the above-named purchaser, the successors and assigns of the same, from the date of this voucher to the time of its payment, shall have bought their supply of such kinds of goods as are produced by the Distilling and Cattle Feeding Company, and all compounds thereof, exclusively of one or more of the dealers named on the back hereof, until further notified, and shall also have subscribed to the certificate on the back hereof.

DISTILLING AND CATTLE FEEDING CO.

By J. B. GREENHUT, *President*.

When due forward to the *German-American National Bank of Peoria, Ill.*, where this voucher is payable without exchange or other charge.

(Stamped across face:) Not transferable nor negotiable.

[Back of voucher.]

It is hereby certified that from the date of this voucher to the maturity thereof the within-named purchaser, and the successors and assigns of the same, have purchased all of their supply of such kind of goods, and their compounds, as are produced by the Distilling and Cattle Feeding Co., exclusively from one or more of the dealers named hereon.

Mr. LUTTIES testifies that, being a wholesale dealer, he bought liquors from the distributors of the combination and received rebate vouchers, at first of 5 cents a gallon, afterwards of 7 cents, payable by the trust. Owing to this indirect method of issuing rebate vouchers the trust expected to be better able to escape

payment. The rebates were granted only on condition that the dealers buy exclusively trust products, and since they were payable only after 6 months, they made a strong means of controlling dealers, who would not want to forfeit rebates already due. The witness's company, in order to evade this requirement, established a second company which bought goods from other distillers. The trust paid the rebates due notwithstanding, fearing to lose the trade of the company altogether.

"The rebate business is simply a contract that we would buy all our spirits from the trust, and we only made such a contract because we could not get our spirits anywhere else." But excessive prices were charged, new distilleries were built, and dealers without such a rebate contract could secure a supply and sell it at a profit where those buying from the trust could not. (250, 251.)

Mr. COOK, a wholesale dealer, confirms the testimony of Mr. LUYTIES in its main outlines. (241, 242.)

Mr. CLARKE also describes the rebate system, agreeing generally with the other witnesses. He adds that both distributors and wholesalers were obliged to buy exclusively from the combination, and the records required by the United States Government to be kept by dealers were used as a test of conformity to this agreement. (171, 172.)

2. *Failure to pay rebate certificates.*—Mr. CLARKE testifies that the rebate system at first worked well, tending to hold trade, and the rebates were paid promptly when due, 6 months after sale. But during 1893 or 1894 the company used money on hand designed for rebates in buying up several competing distilleries. Dealers became alarmed and the company was compelled to issue mortgage bonds to protect them. Holders of these bonds afterwards applied for a receiver for the corporation. (172, 173.)

Mr. McNULTA states that the amount of bonds issued to guarantee the payment of rebates was \$2,500,000. (195.)

Mr. LUYTIES refers to the committee established by the rebate holders, and states that a lawsuit was begun by it. This, however, proved very expensive, and finally most of the rebate vouchers which had been placed in the hands of the committee were returned to their owners, who settled with the combination directly. (251.)

Mr. RICE also describes the organization of the committee of rebate holders. He adds that, while the information elicited by this committee led to action by a stockholders' committee which finally resulted in a receivership, the rebate holders' committee did not itself bring about that receivership. (831.)

3. *Later practice.*—The Standard Distilling Company, according to Mr. Cook, offered to distributors a rebate of 1 cent per gallon, payable in 6 months, and half a cent more, minus certain expenses, payable in 60 days. This would give only about 75 cents a barrel for handling goods worth \$60 and bearing the risk of credit and leakage. It was thought that the plan was thus to gain entire control of the distributing trade, since the trust itself had numerous distributing houses connected with distilleries which would be placed at an advantage. Several distributing houses refused to accept these terms and have established a distillery of their own. (244.)

Mr. CLARKE also states that the rebate system was reestablished by the American Spirits Manufacturing Company and the Standard Distilling and Distributing Company, but that rebates are given at the time of his testimony, May, 1899, only to distributors or rectifiers, amounting to 1½ cents. The wholesalers objected to the system, with its requirement of exclusive purchase from the combination, and it was abandoned in their case. The rectifiers also oppose the system. (181.)

Mr. CLARKE also states that distributors for the trust are at present obliged to sell spirits at a fixed price, but they have an association among themselves for sustaining prices of their own products (rectified whisky, etc.). (188.)

Mr. BRADLEY refers to the existence of the previous rebate system with its attempt to compel the purchaser to deal only with the combination. He believes that the American Spirits Manufacturing Company has not pursued this practice during the past 2 or 3 years. Mr. RICE states that the American Spirits Manufacturing Company never employed the rebate system at all. (813, 814, 834.)

4. *Abandonment of rebates.*—Mr. RICE and Mr. BRADLEY testify that the Distilling Company of America has entirely abandoned the practice of granting rebates to distributors and dealers. It sells practically for cash, and makes no attempts to force the dealers to handle its products exclusively, hoping to retain their trade by low prices and by the ability to furnish all the different classes of products desired by the purchaser. (814, 847.)

Mr. BRADLEY also states that, while the combination sells spirits only to large dealers, it gives no advantage to rectifiers and compounders over other dealers in proof spirits. (814.)

C. Prices and margin of profit.—A full discussion of the variations in prices of whisky under the combination, and the effect of the combination on the margin of profit, is given in the Introduction. The following table, compiled by Mr. McNulta from the records of the Distilling and Cattle Feeding Company, shows the prices and cost of production of that company from 1891 to 1895:

	Fiscal years ending Mar. 31—				10 months ending Jan. 31, 1895.	Present price.

Mr. COOK states that the margin of profit demanded by the combinations until recently has been excessive. Certain distributors and wholesalers who were dissatisfied with the profits left them by the combination made an investigation as to the cost of distilling. It was estimated that the cost of making spirits (including the cost of corn), if not increased by excessive capitalization, would be about 10 cents per gallon, while the combination was selling at 14 or 15 cents. Distributors would be willing to accept prices such as to yield the trust 2 cents a gallon above the cost of manufacture. If this were done the trust would meet no competition and could pay a reasonable dividend, even on its excessive capitalization. One cent a gallon net profit would mean \$50,000 or \$60,000 a year profit on a distillery, such as that owned by the witness, costing \$150,000. (244, 246, 248, 249.)

Mr. McNULTA testifies that the average cost of the distillation process alone probably varied from one-half to 1½ cents per gallon, according to the plant. During his administration of the plants an average of the cost was taken and the policy was to obtain from 1½ to 2 cents profit. (209.)

D. Existing control of output.—1. *Spirits.*—Mr. CLARKE testifies that at the time of the failure of the Distilling and Cattle Feeding Company in 1895 there were many competitors in the spirits business. He does not believe that the American Spirits Manufacturing Company, which succeeded the Distilling Company, controlled over 60 per cent of the product. The Standard Distilling and Distributing Company, as already pointed out, secured control of most of these outside distilleries. According to Mr. Clarke prices were maintained at a profitable scale for some time during 1898 and 1899, until the establishment of the large new distillery at Terre Haute. At the time of his testimony, May, 1899, Mr. Clarke believed that the American Spirits Manufacturing Company and the Standard Distilling and Distributing Company controlled about 75 per cent of the output of spirits. (178, 189.)

Mr. BRADLEY and Mr. RICE, however, testify that the American Spirits Manufacturing Company and the Standard Distilling and Distributing Company control (October, 1899) from 85 to 90 per cent of the product of spirits in this country. They are mashing together about 40,000 bushels per day, while the new distillery at Terre Haute, known as the Merchants' Distillery, mashes about 4,000 bushels. There are 5 or 6 smaller distilleries besides, but these are practically limited to local markets, and can scarcely be considered a competitive factor. According to Mr. Rice the American Spirits Manufacturing Company controlled, prior to the formation of the Merchants' Distillery, about 55 per cent of the output of spirits, and the Standard Distilling and Distributing Company about 85 per cent. (814, 835.)

Mr. Bradley states that the two companies now control about equal proportions, the total being 85 per cent.

Mr. COOK and Mr. LUYTIES, who are interested in the Terre Haute distillery, likewise testify that its capacity is about 4,000 bushels daily, or about one-tenth of the total consuming capacity, while the combination controls probably 85 per cent. They also state that this new distillery was established by a number of distributing and wholesale houses, who were unwilling to accept the low rebate offered by the combination. Since it is controlled by distributing and blending houses, saving in the expense of selling and administering the business is effected.

The distillery is new, has the best apparatus, and can compete in quality and cheapness of production. (Cook, 244, 246, 248; Luyties, 253, 255).

Mr. BRADLEY testifies further that the American Spirits Manufacturing Company is now operating only 5 distilleries out of 12 which were running 2 years ago. Four of these are at Peoria and 1 at Terre Haute. He knows of only 4 distilleries of proof spirits outside of the company. (816, 817.)

2. *Control of beverage whiskies.*—Mr. RICE testifies that the Kentucky Distilleries and Warehouse Company has secured control of about 90 per cent of the standard brands of Kentucky Bourbon whisky. It owns 56 or 57 plants. The Kentucky whisky business depends altogether upon the brands, popular ones commanding prices very much higher than those of staple whisky. There was no intention on the part of the combination to control any particular proportion of the total distilling capacity.

Mr. BRADLEY confirms this evidence, stating that it is a very difficult question to know what proportion of the total output is controlled by the Kentucky Distilleries and Warehouse Company. Experience warrants the belief, however, that the combination may sell yearly 9,500,000 gallons of whisky of standard brands, and about 5,000,000 gallons of cheap whisky made in the new distillery which it has established for that purpose. The average consumption of Kentucky whiskies has been about 20,000,000 gallons.

The combination has not so far sought to control any great proportion of the rye whisky distilleries. Those which it has purchased have been secured for the purpose of enabling the combination to furnish dealers every class of goods which they may desire to buy, thereby furthering its ability to hold their trade exclusively. According to Mr. Bradley the two distilleries in the East controlled by the Distilling Company of America will produce about 2,000,000 gallons annually, or about one-sixth of the total output of Eastern rye whiskies.

According to Mr. Rice there are 7 or 8 standard brands of rye whisky, of which perhaps the two best are those controlled by the new combination, Mount Vernon and Hannisville. The brand has its value and retains its value much from the location in which the whisky is made, the rye whisky business, for example, being centered almost altogether in Pennsylvania and Maryland.

Mr. Rice believes the output of the combination may be possibly 25 per cent in value of the Eastern rye whiskies. (Bradley, 818; Rice, 836, 837.)

3. *Rectifying and distributing.*—Mr. RICE stated that the combination could hope to control the spirits business, and to secure satisfactory prices, only by having considerable control over the rectification and distributing of whiskies made from spirits. There is no market for pure spirits directly to consumers, and everything depends upon the distributors. These have their established names or brands, their regular customers, and the necessary machinery for securing trade. The combination has sought accordingly to secure control of a considerable proportion of this branch of the business. Practically all of the spirits produced by the Standard Distilling and Distributing Company and the American Spirits Manufacturing Company are sold through the United States Spirits Association, which is composed of 54 large distributors. Sixteen of these are branches of the Standard Company, but, as Mr. Rice believes, these 16 handle two-thirds of the entire production of the combination. (834, 835.)

E. *Present policy of combination as to prices.*—Mr. RICE and Mr. BRADLEY both testify that it is the present policy of the Distilling Company of America to abolish the rebate system in the sale of spirits, to reduce prices and the cost of production to the lowest possible limits, and to make no special cuts in prices to particular individuals. The prices of spirits were cut materially in September, 1890, being placed at a basis sufficient to yield a reasonable but comparatively low profit. The price of spirits will be made \$1.23 per gallon on the basis of a price of 30 cents per bushel for No. 2 corn, and will vary with fluctuations in the price of corn, one-half cent per gallon for each 2 cents change in corn. Contracts are made with dealers for a year on this plan.

Both of these witnesses believe that it is necessary to keep down the production of spirits in order to secure reasonable prices, but they do not intend to prevent competition altogether or to make special cuts against competitors. The economy of production on a large scale by the combination will enable it, in their opinion, to retain a large proportion of the total output.

Mr. Rice says that the purchaser cares comparatively little how much he pays for a fancy brand of whisky. The only necessity is to control the output of that particular brand. The combination has complete control of nearly all of the standard brands.

Mr. Bradley declares that the ownership of certain of the most standard brands constitutes the most perfect possible monopoly, and that the purchaser can be "screwed down to the last notch."

Mr. Bradley states that the combination is already charging prices a little lower for the standard brands of Kentucky whiskies than have been charged before, and that the quality will be improved. The price of the cheaper grade of whisky which is being made in the new distillery established in Kentucky is only 15 cents per gallon, the lowest price ever known for Kentucky whisky. (Bradley, 814, 815, 827; Rice, 845, 847.)

F. Effect of changes in price.—There is some difference of opinion as to the effect of increase or reduction in prices on dealers and consumers respectively.

Mr. McNULTA believes that an increase in the price of spirits, whether through combination or increase of tax, is distributed between wholesale and retail dealers and consumers. The chief burden, so far as liquors used for beverages are concerned, falls on the retailer, the price per glass not being raised. The large consumer of spirits, in manufacturing or otherwise, bears most of the increase on his purchases. (236.)

Mr. CLARKE also believes that wholesale dealers get even larger profits when prices are higher, and that prices and quality to consumer do not vary. All the effect of raised prices falls on the retailer, whose profits are so high that he does not feel the difference. He sells whisky at five or six times its cost. (179.)

Mr. COOK believes that a material increase in price of liquor, such as that due to a higher tax, practically falls upon consumers. The dealer can not change his prices, but so far as possible will buy cheaper goods. The witness does not think, however, that an increase of not over 25 cents per gallon would affect even the quality, since it would not greatly lessen the retailer's profits. There might be some change in the price of bottled goods, but often well known brands could not be changed in price because of custom and of competition. (242, 243, 245.)

Mr. LUYTIES testifies that wholesale dealers have to bear some of the burden of a rise in prices, as was found by the experience of the witness in the case of the 20-cent increase made by the combination in 1893. The consumer at the bar pays no more, but the dealer is induced to buy an inferior quality. Liquor dealers are overburdened with taxes, and where these are raised they are practically compelled to sell poorer goods in order to make a living. (256.)

Mr. BRADLEY states that the effect of the reduction of the prices of whiskies, which is expected to result from the combination, will ultimately be to benefit the consumers very materially. The witness does not know what proportion of the advantage the retailer will get, but he can not altogether escape the competition of other dealers and must give part of his saving to the consumer in better quality or otherwise. Moreover, the great bulk of whisky is not sold to the consumer by the glass in barrooms, but in bottles through stores. In the case of the latter method the price to the ultimate consumer will doubtless tend to fall. (830.)

Mr. RICE believes that the jobber or distiller recoups himself for an increase in the price of spirits by increasing the proportion of spirits in the rectified whisky, perhaps putting only 4 gallons of rye whisky instead of 5 into the barrel. The retailer and the consumer thus get inferior quality. On popular brands which command high prices, however, slight changes, such as are likely to occur through fluctuations in the cost of production and the price of corn, will practically not affect the price or the quality to the retailer or consumer. (846.)

IV. ECONOMIES AND ADVANTAGES OF COMBINATION.

A. General.—Certain witnesses pointed out that the ease with which new distilleries, especially of spirits, can be established makes it almost impossible for the combination to assure itself of the control of the business. Others, however, believe that if advantage is taken of all possible economies which can result from combination, and if prices accordingly are kept low, competition will not be provoked. This is apparently the hope and expectation of Mr. Rice and Mr. Bradley, whose evidence has just been referred to (p. 86).

Mr. LUYTIES, although an independent producer, believes there is no business in which there is so great necessity of combination as distilling. When all distillers were independent it was impossible for them to make money. But the policy of the combination should be to cheapen production and improve quality, to make a moderate profit, and thus unite the business. The attempt to maintain excessive prices has forced competition. (251, 253, 255.)

Mr. McNULTA, the receiver of the Distilling and Cattle Feeding Company, is of the opinion that a combination in the whisky business can control the market only by reducing prices and the cost of production below those possible for outsiders. This the witness believes possible, to a large degree, by making

Peoria, with its advantages, the center of production. The present combinations are following this policy. There was no gain in economy in merely combining numerous scattered distilleries, as was done by the trust. (217, 237, 238, 240.)

Mr. McNULTA states that most distillers who entered the trust, especially the smaller ones, lost money by it. They were pleased at first, but the value of trust certificates and stocks declined greatly, and those who had not sold their holdings early suffered loss. (236, 237.)

Mr. LUYTIES believes that the competing distilleries have certain advantages as against the trust. Dealers prefer to buy of independents. The independents are not compelled to try to pay dividends on excessive capitalization, but are content with a fair profit. The distillery which now competes most vigorously was established by a number of distributing and blending houses, which thus make a saving in expense of selling and administration. The distillery is new, having the best apparatus, and its product can easily compete in quality. (253, 255.)

Mr. CLARKE, an independent distiller, also testifies that dealers prefer to buy of independent producers, and the trust has no special advantages in production above a good-sized independent distillery. The witness believes that competition on a large scale and also competition by relatively small producers is likely to continue. By changing customers rapidly, and depending for trade partly on preference for particular brands, an independent can do a good business. (184, 189.)

B. Concentration in large and efficient plants.—1. *Spirits.*—The greatest economy effected by the combination was apparently made by the closing of many inferior distilleries which had formerly been in operation, and by concentrating the production in the most favorably located and best plants. Several large new distilleries were established.

Mr. CLARKE testifies that only 10 or 12 of the 80 distilleries which joined the original combination were kept permanently in operation. Great economy was made in the reduction of the working force and in other ways. (170, 185, 190; see also above, pp. 81, 82.)

Mr. McNULTA confirms the testimony as to the large number of distilleries closed, but looks at the matter rather from the standpoint of the attempt to reduce the output of whisky. (203, 216, 238.)

Mr. RICE testifies that the great majority of the plants which entered the original combination represented a mere burden to it, being unfavorably located and uneconomical. The American Spirits Manufacturing Company took over only 17 of the plants from the old Distilling and Distributing Company, and of these only 5 are now operated. (832.)

Mr. LUYTIES testifies that the trust can run its distilleries more regularly, and regular operation is necessary in order to fulfill contracts for feeding cattle. Manufacture in large plants is cheaper, although the difference between the distillery of 10,000 bushels capacity and one of 4,000 bushels would not be great. The trust also has the advantage of the most skilled administrative officers. (254, 255.)

Mr. CLARKE believes an individual distillery of reasonable size can be operated almost as advantageously as those in a combination. The full advantage of economical production is reached at 3,000 to 5,000 bushels daily capacity. The combination makes no savings in buying grain or fuel, and probably has no rebates in freight rates not received by others. The trust has the advantage of being able to dispose of a surplus in foreign markets, where orders are usually only for large lots. (184.)

2. *Kentucky whiskies.*—The business of producing fancy brands of whiskies can not apparently be consolidated into fewer plants, since the trade-marks themselves are known by their location. But, according to Mr. BRADLEY, the combination has been able to produce a staple quality of straight whisky at 15 cents per gallon, the lowest cost of refining known in Kentucky. It has established a new distillery for this purpose, to supply the demand for whisky of that quality. (829.)

C. Improved processes.—1. *Spirits.*—Mr. McNULTA states that the spirits combination has used the best processes and machinery on a large scale. The main improvements in methods, however, were apparently made before its formation. Between 1870 and 1880 a yield of 3 to 3½ gallons of high wines per bushel of corn was considered good. The trust extended the improved processes already known, and by 1890 was securing about 4.9 gallons of high wines or 4.75 of finished product. The main improvements since that time have been in the use of copper in all parts of the distillery. The average yield secured by the combination from 1890 to 1894 is shown below. The average yield of the Distilling Company for 5 years was 4.685 gallons as compared with 4.326 for all the distilleries in the country, including its own. Increase in yield is largely due to use of better yeast, the

most effective germs being ascertained by scientific examination and experiment. Distillers sometimes pay exceedingly high prices for yeast. (202-204, 215.)

Year.	Yield per bushel.
1890	4.675
1891	4.709
1892	4.616
1893	4.696
1894	4.748
Total	4.685

Mr. BRADLEY states that the distilleries in the combination now obtain about 4.80 gallons of pure spirits, on the average, per bushel of corn. (826.)

Mr. RICE states that the production of high wines at present is a little over 5 gallons per bushel. This latter figure refers to the product of alcohol before rectification through charcoal. (844.)

Mr. CLARKE also believes that the spirits combinations have made improvements in processes by the employment of skilled chemists and by experimentation. (187.)

2. *Kentucky whisky*.—Mr. BRADLEY testifies that the combination of Kentucky distilleries will result in improved quality. On account of fierce competition many distilleries had resorted to the use of "cookers," in order to reduce the cost of manufacture. This increased the yield, but made the quality inferior. The combination has gone back to the old methods of making fine whisky in every instance. (830.)

D. *Location and transportation*.—Mr. McNULTA states that it is doubtful whether the spirits combination has any advantages in transportation, by rebates from railways or by filling orders from the nearest plant. Purchasers usually designate particular brands. But production at Peoria, which was made the chief center of the trust, is specially economical because corn is cheap, this being the center of a great corn region, coal mines are near, real estate is less expensive than in larger cities, and handling of corn by railways is easier, while the special water supply is of very great advantage. There is an unlimited quantity of water from wells about 30 feet deep, having a temperature the year round of about 54 degrees. This is used for cooling the warm mash and is much more satisfactory and economical than ice. (201, 202.)

Mr. LUYTJES states that the trust, having a large purchasing capacity and a heavy demand, can ship spirits rapidly and in large quantities, thus saving leakage and damage. High-proof spirits, if kept for 1 or 2 days too long in transit or storage, lose enough to destroy all profit. (254.)

E. *Advertising and selling of goods*.—Mr. BRADLEY testifies that the savings by combination in the reduction of the number of salesmen, and of advertising and selling expenses generally, are very great. The saving is important even in the distribution of spirits, but is most marked in the sale of standard brands of Kentucky and rye whisky. The witness has made a calculation that somewhere between the distiller and the consumer in this country \$40,000,000 is lost. This goes primarily to the attempt to secure trade. It is all wrong and does not enable the consumer to get better whisky, but only makes him pay a higher price. Each of the different distillers has spent immense sums for advertising his brands and pushing them in various ways. The combination has so far been able to dispense with about 300 salesmen, although apparently the advertising of special brands has not yet been done away with entirely. The tendency of the combination is to bring the manufacturer and the consumer closer together, to increase the purchasing capacity of the consumer just as machinery has done.

The witness adds that a large proportion of the traveling salesmen who have been dispensed with "are still working for the old owners, but when that whisky is sold their occupation is gone." (829-831.)

F. *Advantage of controlling different branches*.—Mr. BRADLEY testified that the new Distilling Company of America will have a great advantage over its competitors by the combination of all different branches of the whisky business. It can, for example, practically prevent the manufacture of spirits in Kentucky and of Bourbon whiskies outside of Kentucky; can use the great machineries of the distributing companies for selling Kentucky whiskies as well as spirits, and can, through its distributors, supply a wholesale dealer every class of goods which he uses, thereby better enabling the company to hold his exclusive trade. (819.)

V. EFFECT ON EMPLOYMENT AND WAGES.

Mr. CLARKE states that the number of men employed has probably been reduced somewhat, but not much, by combination. Wages have not changed materially, but have been made uniform and for some minor positions increased. Laborers receive from \$11 to \$30 per week, averaging perhaps \$18. Many would have lost employment in any case by closing of refineries through failure. Only the engineers among distillery employees are organized. Work is quite steady. (185, 189, 191.)

Mr. RICE testifies that labor is not an important factor in the distilling business, since the plants are operated almost automatically. The combination has never had a strike. (848.)

VI. TAXATION.

Mr. McNULTA believes that the system of taxation of liquors should be modified in several ways with a view to increasing greatly the output, especially for use in the arts, thereby increasing the demand for corn and raising its price. The most important changes would be (1) equalization of tax on different liquors in strict proportion to the amount of alcohol contained; (2) remission of tax on alcohol used for all purposes except as a beverage; (3) permission to use tanks instead of barrels for storage and shipment; (4) discrimination against the products of other countries which discriminate against our own; (5) reduction of tax on spirits from \$1.10 to 70 cents, or even 50 cents, per gallon. (225-236.)

A. Rate and form of tax.—1. *Present rate excessive.*—Mr. McNULTA declares that the present tax on spirits is unjustly high. The cost of spirits varies from 8 to 15 cents per gallon, the tax being \$1.10. This is virtually a tax on corn, amounting to \$5.50 per bushel, so far as used in distilling. The high tax reduces revenue by discouraging the use of spirits for many manufacturing purposes. It also stimulates illicit manufacture by the high profit accorded. The loss from this source to the Government is fully \$10,000,000 yearly. By reducing the tax to 70 cents, or possibly 50, the consumption as a beverage would scarcely be increased, while the use for manufacturing purposes would vastly increase and illicit manufacture would practically disappear. The Government would profit by the change. (229-234.)

Mr. LUYTIES holds that the present tax, sometimes amounting to 2,200 per cent of the cost of spirits, is excessive. The witness believes that the consumption of spirits per capita has considerably decreased in recent years, owing to the tax. The point of greatest revenue can be determined only by experiment, but a reduction to perhaps 75 cents would certainly largely increase consumption. (251, 252.)

Mr. BRADLEY is inclined also to believe that the highest revenue point for the tax on whisky is 75 cents per gallon. A reduction from \$1.10 to 90 cents would greatly increase the revenue.

Mr. RICE, in support of the contention that the highest revenue point of the tax on spirits is about 70 or 75 cents per gallon, submitted a table showing the total number of gallons upon which the tax has been paid at the different rates which have prevailed in this country since 1860, and the amount per capita of the population. This table shows that while the tax stood at \$2, from 1865 to 1868, the amount of spirits on which it was paid was only 0.30 gallon per capita annually. When the tax was reduced to 50 cents the per capita amount was 1.79 gallons. At the 70-cent rate the per capita amount was 1.65 gallons, and this represented the highest revenue point. The average per capita amount of spirits on which the tax was paid from 1875 to 1895, under the 90-cent rate, was 1.27 gallons, while under the \$1.10 rate for the years 1895 to 1896 the amount was only 0.95.

The following table submitted by Mr. Rice shows the receipts from the tax on spirits yearly since 1889. This shows a considerable increase in the receipts during the year 1899, although the per capita amount of revenue is probably less than during 1893, the total number of gallons on which the tax was paid being 97,458,347 in 1898 as against 83,819,314 in 1899. (841, 843, 844.)

Internal-revenue receipts from spirits during the fiscal years ending June 30—

1889	\$68,281,808.93	1895	73,741,380.57
1890	75,181,685.90	1896	73,743,018.60
1891	78,528,601.16	1897	75,706,518.17
1892	83,776,252.86	1898	86,188,630.91
1893 (97,458,347 gallons)	87,712,513.08	1899 (83,819,314 gallons)	92,201,245.77
1894	78,612,150.22		

Mr. Cook believes that any considerable increase in the spirits tax falls on the consumer, largely through his getting a cheaper quality. It is difficult to know how much an increase will affect consumption. The recent statistics as to the effect of the increase to \$1.10 are misleading, because the tax was paid at the lower rate on a quantity sufficient for three years' consumption. (247; see also above, p. 87.)

2. *Capacity tax.*—Mr. McNULTA believes that the present practice of levying the spirits tax on the capacity of the stills, assuming that they are used successfully to their full capacity, is an injury to the business. The Distilling Company at one time was taxed for spirits supposed to have been made as the result of certain new experiments which had practically failed. The courts decided, in contravention of the revenue officers, that it was not the intent of the Government to collect the tax in such a case, where no fraud was committed. (233.)

3. *Proportion of alcohol.*—The tax on spirituous liquors, in Mr. McNULTA's judgment, should be strictly proportioned to the amount of alcohol contained, which it is very easy to ascertain. At present wine bears no tax, although it often contains from 8 to 17½ per cent of alcohol. Beer contains from 2½ to 6 per cent of alcohol, a barrel usually containing more than 2 gallons. The present tax is \$1 per barrel; that on alcohol and proof spirits, \$1.10 per gallon. The beer and wine producers have sufficient protection from foreign competition and could readily pay the tax. This would greatly increase the revenue of the Government. (225-227.)

B. *Illicit manufacture.*—1. *Illicit stills.*—Mr. McNULTA declares that the present high tax causes a large illicit manufacture in small distilleries, which either escape altogether or pay on a small proportion of their product. Large distilleries, however, being thoroughly under the control of Government officials, pay the tax in full. The penalty, forfeiture of the distillery, is too great to be risked. The present rules are unduly severe. Public opinion is such that a revenue officer dares not decide a doubtful question in favor of a distiller lest he be suspected of accepting a bribe. Judicial functions ought therefore to be taken away from the revenue officers and given to the courts. (231-234.)

Mr. RICE and Mr. BRADLEY are also of the opinion that the present tax of \$1.10 per gallon is so high that it leads to great evasion. It is impossible to collect so high a tax satisfactorily in a country having so large an area; it is vastly more difficult than in a small country like England. (824.)

Mr. Bradley declares that there are illicit stills all over the United States. Perhaps they are more common in the mountains of the Atlantic States than elsewhere, but many are in existence in New York City itself. The profits of illicit distilling are exceedingly great, perhaps \$30 or \$40 per barrel.

It is a very common practice, according to Mr. Bradley, to sell such illicit whisky of poor quality under the names of standard brands. The witness secured in 1 year in New York City over 3,000 bottles of whisky bearing the trade-marks of Old Crow and Hermitage, which contained inferior whisky, most of it illicit. It is easy to carry small quantities of illicit whisky from distilleries to saloons and dives, where it is bottled and sold under false names. (825, 826.)

Mr. Bradley further points out that most illicit whisky is necessarily confined in sale to local markets.

As evidence of the fact that large amounts of illicit whisky are sold even upon the general market, Mr. Rice submits a circular from a firm of whisky brokers and commission merchants in Baltimore, dated June 24, 1899, in which 100 per cent North Carolina corn whisky was offered for sale in the barrel at \$1.19. The cost of the package is 6 cents per gallon, so that the charge for whisky is only 3 cents, the tax being deducted. In North Carolina it is possible, Mr. Rice states, to buy corn whisky at 85 cents per gallon.

Mr. Rice also submits the following statement showing the number of illicit stills which were seized during the fiscal years from 1889 to 1898:

Illicit stills seized during the fiscal years ending June 30.

1889	466	1895	1,874
1890	583	1896	1,905
1891	795	1897	2,273
1892	852	1898	2,591
1893	806		
1894	1,016	Total	12,061

Mr. Rice believes that a comparatively small proportion of the illicit stills are actually discovered and that when they are the owner usually simply moves his plant to another locality. (841-844.)

2. *Illicit manufacture in registered stills.*—Mr. BRADLEY and Mr. RICE point out that, even where stills are duly registered and known to the officers, the small ones, where a Government officer is not constantly in control, report only a small proportion of the whisky which they actually manufacture. Mr. Rice estimates that only one-half of the tax is collected on goods actually produced in from 4,000 to 6,000 of such small stills in the Southern States. The Government simply estimates the number of bushels of grain which can be handled, and the amount of whisky which can be produced per bushel. Strong pressure is brought to bear upon the Government to fix this average production low. As a matter of fact the small distilleries are becoming so expert that they can produce from 4 to 4½ gallons per bushel of corn. (825, 844.)

3. *Remedy—high license of stills.*—Mr. BRADLEY and Mr. RICE believe that the most satisfactory method of improving the collection of the internal-revenue tax is by placing a high license upon stills or otherwise preventing altogether the legal use of stills of small capacity. The Government should be able to have one or more officers in charge of every operating still. It could afford to place two men in charge, even if a distillery made only two barrels per day, since the tax is so high. Mr. Rice believes that a license fee in proportion to the capacity at quite a high rate would be the most satisfactory method. (824, 841, 844.)

C. *Methods of storing.*—1. *Wooden containers.*—Mr. McNULTA states that the existing regulations to insure payment of taxes have come down from a time when frauds were very numerous. They are too severe and exacting for the present time, where the character of the business is entirely different. The requirement that spirits shall be stored and transported in barrels of small capacity involves elaborate care in watching, and necessitates great expense and loss to distillers. If alcohol and high-proof spirits are kept for any length of time in wooden barrels, they lose largely by evaporation and soaking and also deteriorate rapidly in quality. By the use of large copper tanks the work of the Government officials would be much lessened, while great economy would result to the producer. (228, 230.)

2. *Bonded-warehouse system.*—The system of inspection and regulation by Government, according to Mr. CLARKE, is advantageous in compelling accurate records, thus enabling distillers to understand their own business. But the present method of bonding and postponing payment of tax is unfavorable. The tax need not be paid until after 8 years, but after 4 years the package is regauged and the tax is on the quantity then found. A barrel of 48 gallons evaporates about 9 gallons during the first 4 years, and 8 gallons during the next 3 or 4 years. Since the wholesaler, who pays the tax when it is sold to him, must pay it on the quantity evaporated after the fourth year, the tendency is to depress the price of ripe whisky below that of 4-year-old whisky. The tax should be levied on the amount in the barrel when it finally leaves the warehouse for sale. However, the proof of whisky, if kept in a warm place, will increase from 100 to 125 in 4 or 5 years, and addition of water to reduce to 100 is allowed. (182, 183.)

This requirement as to the period of bond is also severely criticised by Mr. RICE. (848; as to its effect on exportation, see p. 93.)

D. *Remission of tax on spirits used in arts.*—Mr. McNULTA believes that alcohol used in the arts and sciences should be entirely free from taxation. There are laws at present intended for this purpose, but no means of executing them have been devised. The witness believes it possible to remit the tax without promoting fraud. The result would be to double the quantity of grain used for distillation and to introduce many new industries which are now prohibited by the high cost of alcohol. There are thousands of uses to which it can be put. Even if the tax were retained at 50 cents a gallon, the increased use would be sufficient to make the revenue as great as from the present tax of \$1.10. (237, 234.)

Mr. LUYTENS, distiller and dealer, testifies that there would be great advantage if some method could be adopted similar to that used in England, by which alcohol or spirits could be methylized and rendered unfit for drinking, the tax then being remitted. But it is a delicate matter and the Secretary of the Treasury has struggled in vain to devise a method suited to prevent fraud, the temptation to mix taxed and untaxed spirits being very great. Until a satisfactory method can be discovered the present practice is best. (252.)

Mr. BRADLEY believes that it will be impossible to remove the tax from alcohol used in the arts. If this were attempted there would be only illicit spirits produced in this country. But to reduce the tax on alcohol to perhaps 75 cents per gallon would greatly increase its use in the arts. (829.)

E. *Exportation and the tax.*—1. *Spirits.*—Mr. McNULTA points out that there are practically no spirits now exported from this country, although it is naturally the cheapest place for their production. There is a very large demand abroad

for various purposes, but this is supplied by Germany, which offers an export bounty, and by Hungary. The exportation from this country is specially hampered by the governmental restrictions connected with the collection of the tax. Distillers practically get no advantage from the drawback of the tax paid in case of exportation. The requirement that all spirits be stored and transported in wooden barrels especially interferes with cheap transportation. (228.)

Mr. BRADLEY and Mr. RICE, of the present combination, confirm the opinion of Mr. McNulta as to the undue obstructions placed in the way of export trade by Government regulations as to taxation of spirits. They especially urge the desirability of the transportation of alcohol in tank cars and tank ships, instead of in barrels.

The quantity of alcohol used in the arts in Europe is very great indeed. It is largely employed, for example, in the manufacture of smokeless powder. From 80,000,000 to 90,000,000 gallons of alcohol are used yearly for fortifying wines. The United States is the cheapest place of manufacture and should supply a large proportion of the demand for alcohol throughout the world. If this were possible, the price of corn would be materially raised, especially when there was a great surplus crop, since alcohol can be manufactured and stored at such times. Practically no spirits or alcohol is now exported. (824, 828, 846, 847.)

Mr. COOK considers that the decrease in exportation is partly due to the German bounty on exportation of spirits and partly to the difficulty and expense of complying with the regulations of our Government as to remission of tax. (245-247.)

According to Mr. LUYTIES one of the great drawbacks to exportation of spirits from this country is the high bond which is required by the Government—sufficient to cover the entire tax. (259.)

In Germany, according to Mr. LUYTIES, the Government considers it necessary to develop the spirits manufacture, especially on account of the feed secured as a by-product. Accordingly the amount which each distillery is allowed to produce is limited, and a tax of 50 marks per 100 hectoliters is levied up to that amount, while if more is produced the tax is 70 marks, unless the surplus is exported, when the entire tax is rebated. (256, 257.)

2. *Exportation of whisky.*—Mr. RICE states that, under the present statute, whisky which is held for aging must be taken out of bond and the tax paid at the end of 8 years, unless it is exported. Frequently it happens that the distiller has no market for his product in this country at the precise time when the 8 years expire, and in order to avoid the immediate payment of the tax he ships the whisky to Germany to be stored until he is able to dispose of it, when it is reimported. This is practically the only way in which whisky is exported. The Government attempts to prevent this evasion, but exporters make a mental reservation in the statement that the exportation is bona fide. (848.)

Mr. BRADLEY also points out that the prohibition of the law upon the holding of bottled whiskies in bond for exportation results in a great hindrance to the export trade. It is desirable that permission should be given to bottle whiskies in advance and hold them subject to orders for shipment. Mr. Bradley likewise points out that the amount of drawback upon the exportation of whiskies is only 90 cents per gallon, the law having been left unchanged, apparently by oversight, when the tax was raised to \$1.10. The law puts many other ridiculous obstructions in the way of the exportation of whisky. (824.)

Westgate, T. B., independent refiner, and officer in independent oil organizations	365-383

I. HISTORY OF STANDARD OIL COMBINATIONS.

A. Organisation and purposes.—Mr. EMERY quotes part of the testimony of Mr. Flagler before the Committee on Manufactures of the House of Representatives in 1888. This shows that in 1870 the firm of Rockefeller, Andrews & Flagler was formed to succeed the separate firms of Rockefeller & Co. and Rockefeller & Andrews. The capacity of the new firm was about 600 barrels of crude oil per day. This firm in the same year was reorganized under the name of the Standard Oil Company of Ohio, with a capital of \$1,000,000. (606.)

Mr. ROCKEFELLER made affidavit concerning the growth of the Standard Oil Company as follows:

"1. Q. What was the first combination in which you were interested of different establishments in the oil industry?—A. The first combination of different establishments in the oil industry in which I was interested was the union of William Rockefeller & Co., Rockefeller & Andrews, Rockefeller & Co., S. V. Harkness, and H. M. Flagler, about the year 1867.

"2. Q. What were the causes leading to its formation?—A. The cause leading to its formation was the desire to unite our skill and capital in order to carry on a business of some magnitude and importance in place of the small business that each separately had theretofore carried on. As time elapsed and the possibilities of the business became apparent we found further capital to be necessary, obtained the required persons and capital, and organized the Standard Oil Company with a capital of \$1,000,000. Later we found more capital could be utilized and found persons with capital to interest themselves with us, and increased our capital to \$3,500,000. As the business grew, and markets were obtained at home and abroad, more persons and capital were added to the business and new corporate agencies were obtained or organized, the object being always the same, to extend our business by furnishing the best and cheapest products." (795.)

It appears that the Standard Oil Company was reorganized in 1873 with a capital of \$2,500,000, which was again increased to \$3,500,000 in 1875, which remains the amount of capital of this particular company to the present time.

B. Growth of monopoly during the seventies.—Beginning early in the seventies the men interested in this company began to associate themselves with other refiners and to extend their business with great rapidity. They also secured control of the pipe lines of Pennsylvania, a process which is more fully described under a separate heading. (See p. 100.) Numerous refineries were either driven out of business altogether or were in some way led to affiliate with the Standard Oil Company. Certain witnesses attribute this growth of control over the refining business partly to the ownership of the pipe lines, but the chief reason assigned by many opponents of the combination is railroad favoritism, a detailed history of which is given later on. (See, e. g., RICE, 689, 693.)

Mr. EMERY especially refers to previously existing testimony to show the manner in which the Standard Oil Company, through the influence of railway discriminations, grew from a small concern in 1870 to a practical monopoly of the entire oil refining business in 1879. In 1870 there were approximately 250 refineries, most of them located in the oil regions. The Standard Oil Company then owned about 4 per cent of the refining capacity of the country. In 1879 Mr. Rogers and Mr. Bostwick, members of the Standard Oil Company, testified before the Hepburn committee that that company, or the combination which it represented, owned or controlled 90 or 95 per cent of the refining industry in America. There was a time, Mr. Emery declares, when he did not know of a single independent refiner.

The witness himself was interested in the Octave Oil Company at Titusville, having a capacity of about 800 barrels daily. This company was invited to join

the Standard Oil Company, but refused to do so. In the latter part of 1879 it was forced to sell out to that company, having been unable to maintain its business. The refinery cost \$85,000 and was sold for \$45,000. It was run for 2 or 3 years by the Standard Oil Company, but was finally dismantled.

In 1880 the witness built a new refinery in Philadelphia at the suggestion of the Pennsylvania Railroad, but was again driven out of business by discriminations, especially by the inability to obtain cars to ship oil from his wells to his refinery. (646-649).

Mr. DODD, in reply to a schedule of questions, made the following statement as to the process of growth of the Standard Oil combination:

"About the year 1872 the condition of the refined-oil business was disastrous, and failures were of constant occurrence. Leading refiners began to combine for the purpose of making the business successful. The combination was by means of purchase of stocks and interests of various companies, and, until 1882, the combination was solely by stock ownership in the hands of a limited number of individuals, who controlled the corporations as agencies in a common business. In 1882 these owners, whose names appear in Exhibit A, entered into the trust agreement. The companies whose stock they owned, in whole or in part, appear in the same agreement. They were not then competing companies. The individuals named as trustees controlled them by virtue of absolute ownership of a majority of their stocks. When the trust was dissolved, in 1892, the same fact existed. The individuals then trustees continued to control the companies by virtue of absolute ownership of a majority of their stocks." (799.)

Mr. ROCKEFELLER, in answer to interrogatories submitted by the commission, made affidavit as to the growth of the Standard combination. He attributed the extension of its business, not to crushing of competitors, but to the need of additional capital in order to employ the most effective methods of manufacture and transportation. From time to time it was discovered that existing methods were unsatisfactory and larger investments had to be made for improved methods. Thus to perfect the pipe-line system required some \$50,000,000 of capital. This could not be obtained without industrial combination. (795, 797.)

C. Organization of trust, 1882.—Up to 1882 there was no formal consolidation of the numerous refining and pipe line companies which were controlled by the officers of the Standard Oil Company or which worked in harmony with it. At this time the Standard Oil Trust was formed, being the first organization to take on that form. The various separate organizations placed the control of their stock or property in the hands of trustees, who were thus able to control completely the operation of all the concerns.

Mr. MONNETT, attorney-general of Ohio, testifies that there were altogether 39 companies which entered the Standard Oil Trust, 14 of which transferred all their stock and the remainder a controlling interest to the trustees. Besides this a large number of individual owners and firms entered the trust. There were 9 trustees, holding office for 3 years, with one-third retiring annually.

The trust certificates were issued in amounts equal to the appraised value of each plant transferred. According to Mr. Monnett, there was no attempt to inflate the valuation. Each company agreed that no stock should thereafter be issued excepting to the trustees. (300, 301.)

Mr. EMERY, on the other hand, testifies, but without submitting detailed evidence, that refineries and other establishments were taken into the trust at rates greatly in excess of their actual value, the chief consideration being the power of monopoly which was thereby acquired. (630.)

Mr. MONNETT testifies that the trustees themselves held 466,280 of the original 972,500 trust certificates. They also hold more than half of the shares of the present constituent corporations, while Mr. Rockefeller holds more than half of the number held by the trustees. (307.)

D. Existing organization.—1. *Reorganization into separate companies, 1892.*—The Standard Oil Trust, having been held illegal in various States, was dissolved in 1892, the separate establishments and plants being reorganized into 20 constituent companies having a capitalization of \$102,233,700. Trust certificates when surrendered were replaced by a proportion of the shares of each company, properly divided.

The following form of transfer was used to give holders of trust certificates proportionate shares in the capital stock of each of the constituent companies established at the time when the trust form of organization was abandoned:

Know all men by these presents:

That we, John D. Rockefeller, Henry M. Flagler, William Rockefeller, John D. Archbold, Benjamin Brewster, Henry H. Rogers, Wesley H. Tilford, and O.

B. Jennings, trustees for winding up the Standard Oil Trust, by W. H. Tilford, our attorney in fact, and John D. Rockefeller, of ———, do hereby constitute and appoint John Bensinger, of New York City, our true and lawful attorney for the purposes following, to wit:

Whereas John D. Rockefeller has placed in the hands of said attorney assignment No. A 865 for ~~§§§§§~~ of the amount of corporate shares held by said trustees on the first day of July, 1892, in each of the companies whose stocks were so held.

Now the said attorney is hereby authorized to secure from each of said companies transfer upon their corporate books of said stock and stock certificates for whole shares, and scrip for fractional shares thereof, and when the said certificates and scrip are received from all the companies referred to the said attorney shall deliver the same to John D. Rockefeller, and the said assignment No. A 865 shall at the same time be delivered to the said trustees.

And the said attorney hereby agrees to obtain the said certificates and scrip and to deliver the same and the said assignment as above specified.

(Signed in print.)

JOHN D. ROCKEFELLER.
HENRY M. FLAGLER.
WILLIAM ROCKEFELLER.
JOHN D. ARCHBOLD.
BENJAMIN BREWSTER.
HENRY H. ROGERS.
O. B. JENNINGS.

(Signed in ink.)

W. H. TILFORD, *Attorney in Fact*.
JOHN D. ROCKEFELLER, per GEO. D. ROGERS.
JOHN BENSINGER.

(MONNETT, 303, 307, 320; ARCHBOLD, 574–576.)

Thus, Mr. MONNETT testifies, the Standard Oil Company has several constituent corporations in Ohio. The Ohio Oil Company leases oil lands and purchases crude oil. The Buckeye Pipe Line Company, in conjunction with other pipe line companies owned by the Standard, makes a complete system which transports crude oil to the various refineries in Ohio and adjoining States. The Solar Refining Company engages in refining. The refined product is transported by the Union Tank Line Company, which has great advantages in the use of tank-car and terminal facilities. It is by this control of the means of transportation that the Standard secures its monopoly. (299.)

Mr. MONNETT further states that the Standard Oil Company of Ohio, on August 5, 1891, sold its tank cars to the Union Tank Line Company for \$3,500,000, most of which sum it transferred in 1892 to the Standard Oil Trust for distribution among the holders of trust certificates. This was in defiance of the order of the court, of 1892, prohibiting it from further relations with the Standard Oil Trust. Since then this company has paid no dividends, although it still pays salaries. Its accumulated funds have been apparently charged off for depreciation and profit and loss. Its officers refused to submit its books to the courts and are believed to have burned a large number of them. (302, 303.)

2. *Capitalization*.—Mr. DODD, in reply to a schedule of questions, stated that the property of the various companies entering the Standard Oil Trust was valued at \$75,000,000 in 1883. In 1892 the value was estimated at \$121,631,312. Perhaps 50 per cent of this additional value had come from profits invested, the remainder from additional capital subscribed. Up to 1896 about the same proportion of profits continued to be applied to improvements, but since that time the profits have been divided, as is seen from the higher rate of dividends. An average of 5.77 per cent has been allowed for annual depreciation. (799.)

The inventory referred to by Mr. Dodd is as follows (MONNETT, 301):

Companies.	Appraised value.	Capitalization.
Anglo-American Oil Co., Limited	\$6,913,639.49	\$5,000,000
Atlantic Refining Co.	8,681,376.67	5,000,000
Buckeye Pipe Line Co.	7,941,028.15	10,000,000
Eureka Pipe Line Co.	1,547,055.16	5,000,000
Forest Oil Co.	3,528,818.11	5,500,000
Indiana Pipe Line Co.	2,014,063.91	1,000,000
National Transit Co.	25,706,712.97	25,455,200
New York Transit Co.	4,998,300.00	5,000,000
Northern Pipe Line Co.	707,067.00	1,000,000

Companies.	Appraised value.	Capitalization.
Northwestern Ohio Natural Gas Co	\$1,396,760.00	\$3,278,500
Ohio Oil Co	8,280,378.04	2,000,000
Solar Refining Co	711,793.87	500,000
Southern Pipe Line Co	3,279,018.28	5,000,000
South Penn Oil Co	3,021,654.87	2,500,000
Standard Oil Co., Indiana	1,038,518.61	1,000,000
Standard Oil Co., Kentucky	3,604,800.78	1,000,000
Standard Oil Co., New Jersey	14,983,943.30	10,000,000
Standard Oil Co., New York	16,772,186.29	7,000,000
Standard Oil Co., Ohio	3,426,014.72	3,500,000
Union Tank Line Co	3,057,187.41	3,500,000
Capitalization 20 corporations	121,631,312.63	
Excess	102,233,700.00	
	19,397,612.63	

3. *Existing relations of constituent companies and trust.*—Mr. ARCHBOLD testifies that, although the Standard Oil Trust was dissolved in 1892, the men who were the former trustees have held a majority of the stock in all the different companies which made up the trust, so that they work together as harmoniously as before. The latest movement on the part of the combination, in order to secure more complete unity and to provide for the claims of small holders of trust certificates, is the organization of a New Jersey corporation entitled the Standard Oil Company. This corporation has a capital of \$100,000,000 of common stock and \$10,000,000 of preferred stock, and is authorized to own the stock of any of the different corporations connected with the Standard Oil Company and to buy from all parties who own such stock whenever they desire to sell. (574-576.)

Mr. MONNETT testifies that a man could not have his trust certificates converted into stock of the several constituent companies, and get out of the trust, unless he held \$66,000 worth. This enables the trustees and a few others holding large amounts to exchange their certificates for stock and thus to practically control all the constituent companies, while smaller holders retain their certificates and are still receiving dividends upon them. Altogether only 51 per cent of the trust certificates were converted into stock. Holders of fractional shares in the separate companies receive no dividends. (303, 307, 308.)

Replying to this testimony, Mr. ARCHBOLD states that the replacement of trust certificates by proportional shares of stock in the separate companies has been going on steadily, and that only a small number of trust certificates are still outstanding. He admits that the dividends when declared are at a certain percentage upon these outstanding certificates and a properly adjusted rate upon the capital stock of the different companies. The rate of dividend may be considered as if it were entirely upon the trust certificates at their former full amount.

The prices at which Standard stock is quoted on the market are still based on the old trust certificates, since practically the equitable interest in each of the separate companies corresponding to a share in the trust certificates is of the same value. If the purchaser should buy trust certificates on the market and take them to the company it would give him either a proportion of the shares of each of the separate corporations or an equal amount of the stock of the newly formed corporation, the Standard Oil Company, of New Jersey.¹

The Standard Oil Company has always kept its stocks and certificates off from the stock exchange, and there has been very little speculation in them. The officers and directors have bought and sold stocks only to a very limited extent, and usually for the purpose of increasing their own holdings. Mr. Archbold himself has bought and sold only 100 shares during 10 years. (574-576, 579.)

Mr. ROGERS states that when the Standard Oil Trust was dissolved those holders of trust certificates whose holdings were small received only fractional shares in the various separate companies, and on these shares they receive no dividends. The denominator of these fractional shares is about 975,000 and the numerator is often very small, so that the interest is so trifling that it would be impossible to pay a dividend. Nevertheless the Standard Oil Company is prepared to do whatever is fair regarding such fractional shares. (583, 587.)

E. Dividends and profits of combination.—According to Mr. RICE the Standard Oil Trust from 1882 to 1892 paid dividends equal to more than double its entire capi-

¹ Though practically a new organization, this seems to be in form a continuation of the old Standard Oil Company, of New Jersey, with an altered and amended charter, and with its capital increased from \$10,000,000 to \$110,000,000. See p. 1228.

talization in 1888. Since 1892, when the trust was nominally dissolved, 30 quarterly dividends of 3 per cent have been paid, and 77 per cent in special dividends since 1895, making a total of 167 per cent on its capitalization, or in all \$170,730,279. Aside from these dividends the company has invested millions of dollars of its net earnings in producing oil property. (688, 689.)

Mr. MONNETT's testimony confirms the above generally. He speaks specifically of extra dividends of 5 per cent in 1895, 19 per cent in 1896, 12 per cent in 1897, and 4 per cent in 1898. He adds that, judging from the recent rates of dividends, a prominent judge has said that the present value of trust certificates, whose face is \$97,250,000, would be \$486,250,000. (302, 307, 308, 309.)

Other witnesses also refer to the high value of Standard stocks as showing enormous profits. Mr. ARCHBOLD states on this point that the price prevailing at the time of his testimony, \$465 per share, was the highest ever known. (579.)

Mr. DODD submitted the following statement, showing all the dividends declared by the combination since 1892. In addition to these a stock dividend of 20 per cent was declared in 1897. He stated that no distinction had been made in the distribution of profits between the former owners of closed and dismantled plants and others. (799.)

	Per cent.		Per cent.
1892	5.25	1891	12

Mr. BOYLE believes that the profits of the Standard Oil Company have not been reduced by the depression in the price of crude oil. The capital stock of the company before its reorganization several years ago was \$100,000,000, and the witness has heard that it was worth \$500 per share. The stock of the Tidewater Pipe Line Company, which has a capital of \$10,000,000, was quoted at \$2,000 per share. There may be agreements between this company and the Standard, but it is not absolutely under the Standard's control. (480.)

See also as to profits, p. 1335.

F. Ohio suits against Standard Oil Company.—1. *General description.*—Mr. MONNETT, the attorney-general of Ohio, testifies that suit was brought against the Standard Oil Company of Ohio in 1891, and a decree was secured in 1892 directing it to withdraw from the Standard Oil Trust. In November, 1897, the attorney-general summoned the same company before the court on the ground that it had not withdrawn in good faith, but simply modified the form of organization. On the basis of answers to interrogatories submitted to Mr. John D. Rockefeller, information was secured which led to filing suits against all the constituent companies of the original trust which were then doing business in Ohio—the Buckeye Pipe Line Company, Ohio Oil Company, Solar Refining Company, and Standard Oil Company of Ohio. There were four causes of action: (1) As against public policy; (2) for confederating and attempting to evade the decree of 1892; (3) for violation of the Ohio antitrust act of 1898; (4) against the Buckeye Pipe Line Company for transacting telegraph business as a common carrier, which was ultra vires. This company was found to be exchanging business with the Western Union Telegraph Company. (297, 298.)

The present status of these suits (at the time of Mr. Monnett's testimony) is as follows: The officers of the Standard Oil Company of Ohio are before the court on the charge of contempt for refusing to produce their books. They are also held for violation of the original decree of the court, and it may inflict any fine it sees fit. An independent suit has been brought for taking away the charter of this company, and another suit for the same purpose is pending against the Buckeye Pipe Line Company, in which the witnesses are also before the court for contempt in refusing to answer questions. If the existing suits are won, the monopoly of the Standard Oil Company in the Ohio field, which depends on its control of the pipe lines, will be destroyed. (314, 315.)

Mr. ARCHBOLD, replying to the testimony of Mr. Monnett generally, points out that the attacks upon the Standard Oil Company in the courts of Ohio were injurious to the interests of the State, since that company, through the various corporations in which it is interested in Ohio, pays about \$250,000 taxes yearly and distributes \$3,250,000 as wages to 4,700 employees. (543.)

2. *Production of books.*—Mr. MONNETT testifies, in further detail, that in these suits the supreme court of Ohio has ordered the Standard Oil Company of Ohio to produce its books and records, and it has refused to do so, relying on its constitutional rights. The question as to the power to compel it to produce its books is still pending. According to Mr. Monnett, testimony before that court shows that a large number of books and papers were burned 2 or 3 days after the order requiring the production of books was made. The evidence of John McNirney on this subject is quoted in full. He was an employee in the car shops of the Standard Oil Company at Cleveland and assisted in lowering certain boxes which he believes to have contained books from the office of the Standard Oil Company. That same day and the following Monday he assisted in burning a large number of books, taken from such boxes, in the car-shop furnaces. The books were large books, apparently ledgers, and many loose papers and letter-press books were also burned. Altogether 9 chests and 6 sacks of materials were burned. (303-306.)

Mr. ARCHBOLD denies absolutely the fact of such burning of books by the Standard Oil Company. He states that at the time of the original inquiry on the subject the company offered to produce every employee who could have any knowledge on the subject, each of whom would have denied the statement. The attorney-general refused to have them sworn at the time, although he knew that the secretary of the Standard Oil Company of Ohio had made an affidavit that the books were in his possession. (543.)

3. *Alleged attempts at bribery.*—Mr. MONNETT refers to the alleged attempt of the Standard Oil Company to bribe himself, as attorney-general of Ohio, and offers to submit papers in the case, but presents no further evidence. (313, 316.)

Mr. ARCHBOLD testifies that affidavits have been filed with the supreme court of the State of Ohio denying specifically all of Mr. Monnett's charges of attempted bribery, and asking the court to appoint a commissioner to investigate the charges. The court has not acted upon the subject, but the company is anxious that it should do so. (544.)

I. PIPE LINES—CONTROL BY COMBINATION.

A. *Early history.*—Mr. BOYLE gives a somewhat detailed history of the development of pipe-line transportation in the oil business.

The first successful pipe lines were established in 1864 from Pithole to the Miller farm. Others were soon constructed in the same district. These were usually short, scarcely over 5 miles in length, and at first did not even connect directly with the wells themselves, although this practice was soon established. Numerous lines soon grew up in different parts of the oil region, but the first more extended systems date from 1869, when the Mutual Pipe Line was laid more or less throughout Clarion County. Vandergrift & Forman later established a system through Butler County which became the nucleus of what is now known as the United Pipe Line System.

The original pipe lines were only transporters of oil, but the nature of their work soon led them to purchase oil, although at first it was not in the name of the company itself. At times there were rumors casting doubt on the integrity and solvency of some of the pipe lines. The prices which purchasers of oil were willing to pay to pipe lines varied accordingly, since they were sometimes in doubt as to whether the oil would be forthcoming. It was quite common in those days for shortages to be discovered in the amount of the oil held by the pipe lines as compared with the amount which they owed to certificate holders. The lines would use oil or sell it and expect to make up the shortage by purchase later on. Mr. Boyle quotes from a published statement of the Atlantic Pipe Line in 1876 acknowledging a shortage of 6,000,000 barrels, but stating that 15,000,000 barrels had been purchased to cover it. (413, 420, 423, 424, 481, 482.)

Mr. EMERY also makes a brief statement of the early history of pipe lines. He states that the first attempt to combine separate pipe lines into a more complex system was made by William H. Abbott and Henry Harley, beginning about 1866. By 1869 they had a capital of nearly \$2,000,000, and 500 miles of pipe centering in the Miller farm. The concern was then known as the Pennsylvania Transportation Company. (603, 604; compare also Lee, 262, 265.)

B. *Absorption of competing pipe lines by Standard.*—1. *History.*—Several witnesses describe the process by which the Standard Oil Company gradually secured control of the various pipe lines throughout the oil regions. The opponents of the trust attribute the success of the Standard Oil Company in this movement to the railway discriminations upon oil received from pipe lines controlled by that company. It appears that for a considerable period a rebate of 22 cents per barrel

was allowed on oil from pipe lines maintaining the agreed rates of pipage. These discriminations are more fully described under the head of *Railway Discriminations* (pp. 149, 150). Other opponents of the combination ascribe its success in driving out competing pipe lines largely to the practice of paying premiums upon oil in the territory of such competing lines.

Mr. BOYLE gives the fullest statement of the growth of the pipe-line consolidation during the seventies, and attributes it to the natural advantages arising from large capital and from skill in organizing. He testifies that during the early part of that decade very numerous pipe lines had been established. These were at first constructed on a small scale by separate oil producers, but having entered the business many producers were inclined to extend their lines and form a system. There thus arose an excessive number of competing lines, and the solvency and integrity of some of them became a matter of doubt. This excessive competition was the cause of driving the pipe lines into a more complete organization. As early as 1873 or 1874 a pooling arrangement was made by some of the pipe lines, and rebates were paid by railways on oil received from such lines. The United Pipe Line Company was established in 1877, with a capital at first of \$3,000,000, and acquired by purchase a large number of lines. The new company included many producers and stockholders of the smaller companies, but it is estimated that the persons controlling the Standard Oil Company had somewhat more than a one-half interest in the United Pipe Lines. The National Transit Company is the present owner of the United Pipe Lines System, and the Standard Oil Company controls the National Transit Company. (424-426, 474.)

Mr. ARCHBOLD states that the small pipe lines which existed during the early period were inadequately capitalized and inefficient in many cases; that consolidation was welcomed by all producers and resulted in a lowering of charges for pipage from 40 to 20 cents per barrel. (513.)

Mr. ROCKEFELLER also speaks of the necessity of very large capital to conduct the pipe-line business advantageously. (797.)

2. *Premiums on oil reached by competing pipe lines.*—Mr. LOCKWOOD declares that, by means of the high rebates which the pipe lines controlled by the Standard secured from the railways, they were able to offer higher prices for oil to the producers and to sell at lower prices to refiners than independent pipe lines were. In this way 26 pipe lines, built during the early seventies, were driven into bankruptcy, and were absorbed by the United Pipe Line and the American Transfer Company. These pipe lines were practically shut out of the market.

A similar policy has been pursued in attacking independent pipe lines built later. Thus, in 1887, Craig, Elkins & Kimble built the Western and Atlantic Pipe Line. The price of oil at that time was 69 cents, but by the time the new pipe line was fairly in operation, in 1888, the price was raised to 88 cents per barrel, while the white-sand oils in the counties reached especially by the new pipe line were placed at a premium by the Standard Oil Company, which paid from \$1.08 to \$1.18 for oil at the wells. In November, 1889, the price of this oil had reached \$1.30, and the witness, as a producer in that district, was drilling many wells in the hope of very large profits. About this time the new pipe line was bought by the Standard Oil Company at the price demanded by its owners, and the very next day the premium on oil from this district was taken off, while the price of crude generally fell gradually to 53 cents. The witness and other producers suffered great losses from this reduction, while the Standard Oil Company made sufficient profits by it to recompense itself for the purchase of the pipe line. The price of refined oil was not reduced. This great decrease in price could not be attributed simply to the increase in production. (388, 394, 395.)

Mr. PHILLIPS also testifies to the practice of the pipe lines controlled by the Standard Oil Company of paying premiums on oil for the purpose of attacking competitors. He also believes that the Standard recoups itself for the cost of pipe lines purchased by lowering prices to producers and raising them to consumers. (592.)

Mr. BOYLE considers the paying of premiums upon oil in fields reached by independent pipe lines a necessary method of competition. The new pipe lines make it a practice to cut charges for pipage in order to secure business, and the Standard Oil Company practically merely meets such cuts by paying premiums upon oil from the district, while keeping its nominal pipage charge the same. The witness referred especially to the Peerless or Keystone pipe line, which fixed a pipage rate 5 cents below that of the National Transit Company, so that the latter was forced to bid a premium of that amount in order to get oil. The same condition of affairs existed regarding the Craig-Elkins line referred to by Mr. Lee. On being questioned further concerning the amount and purpose of such premiums, Mr. Boyle stated that he had knowledge of premiums being placed on

oil regardless of any superiority in quality, and of premiums being taken off, but that he had no knowledge of the purpose of such premiums. (474, 475.)

Mr. ARCHBOLD states that the premiums paid by the pipe lines controlled by the Standard Oil Company for oil from particular districts are usually due to superior quality of the oil, this being the case at present with Franklin, North Lima, and Scio oil. But "where we have found, after providing these special facilities, which have no value for any other purpose, that our business was attacked by a newcomer, we have, of course, endeavored to protect it." Mr. Archbold admitted specifically that when the American pipe line was built through to Philadelphia a premium was put on the oil from the large fields in Butler County and Washington County, and that this premium was taken off as soon as the pipe line had been purchased. "We would do the same thing again." The premium in these cases was due to the competition, unquestionably. (576, 577.)

Mr. ROGERS confirms Mr. Archbold's testimony in every particular. He states that at present the only premiums which are paid are on account of superior quality. In most cases the Standard Oil Company has been forced to pay premiums by competitors reducing pipage or paying higher prices. A premium is not to be considered as of the nature of a rebate, since it goes to the producer, while pipe-line charges are paid by the refiner or exporter, and rebates would go to them. (582.)

3. *Existing independent pipe lines.*—Aside from the competition of the Producers and Refiners' Pipe Line, hereafter referred to, the Standard Oil Company meets competition in the Ohio field from the Maulattan Oil Company, and in the Indiana field from the Cudahy pipe line. There is trifling competition in the Scio field. (Rogers, 581.)

C. *Opposition of Standard to free pipe-line law.*—Opponents of the Standard Oil Company declare that a further means by which the combination prevented the establishment of competing pipe lines and secured its monopoly was the preventing for a long time of the passage of a law in Pennsylvania permitting the exercise of the right of eminent domain throughout the State for the laying of pipe lines.

Mr. EMERY testifies that the first pipe-line companies were chartered by special acts of the legislature, and that privileges were given only to a favored few. The indignation over the exposure of the South Improvement Company scheme in 1872 forced the legislature to pass a law granting any person the right to lay pipe lines, with the privilege of eminent domain, within 8 of the leading oil counties. The witness at that time sought to persuade Mr. Scott, president of the Pennsylvania Railroad, to permit this law to be made general, with a view to enabling pipe lines to reach competing lines of railway and water transportation. This Mr. Scott refused to do, and the act did not apply to Allegheny County, so that pipe lines could not reach the city of Pittsburg.

Numerous pipe lines were established under this act, but it was practically repealed by the Wallace corporation act in 1874, and within a few years the Standard Oil Company, by a corrupt bargain with the railroads for discriminating rates, forced all but 1 of these lines into bankruptcy, and bought them up. Since 1876 the entire oil district has been under the complete dictation of the trust, until the organization of the new independent pipe lines, beginning about 1890. (605, 606.)

Mr. EMERY, who was a member of the Pennsylvania legislature, and actively engaged in pushing the passage of the free pipe-line bill from 1874 to 1883, further declares that the Standard Oil Company did directly oppose that bill. In 1883, when he and Mr. Lee were making speeches in behalf of the bill in various parts of the State, the Standard Oil Company attempted to influence the farmers by arguing that pipe lines would injure their property. The witness refers specifically to a meeting which was held in favor of the bill at Lancaster, Pa., at which dodgers were scattered headed: "Look out for false prophets." The dodgers declared that "these people are endeavoring to pass a law that will destroy the springs of your farms; it will blow up your houses; it will create havoc in your fields when the pipe bursts, killing the grass. Most dangerous of all laws." Mr. Archbold, so Mr. Emery declares, is mistaken in his testimony on this point. (659, 660.)

Mr. LEE's testimony states practically the same facts as Mr. Emery's on this point, in less detail. He adds that in 1883 the Standard Oil Company probably controlled 90 per cent of the crude oil transported, and it has sought to secure control of all new lines since that time, so that it still has practically the same proportion. (262, 265.)

Mr. ARCHBOLD denies that the Standard Oil Company opposed the passage of the free pipe-line law in Pennsylvania. The company was entering the business largely and understood the importance of the measure to the entire petroleum

trade. He denies the issuing of any circular opposing the measure, but modifies this statement by saying that he does not know of any being issued. (513.)

Mr. BOYLE knows of no direct opposition of the Standard Oil Company to the passage of the free pipe-line law in Pennsylvania or to the laying of independent pipe lines, although he knows of a single instance where the Standard Oil Company secured a right of way in order to prevent another pipe line from being built. (474.)

D. Opposition to laying of independent pipe lines.—1. Charged against Standard.—Another method which has been employed by the Standard Oil Company to prevent the laying of competing pipe lines appears to be the purchase of land intended to be crossed by such pipe lines and the influencing of railways to oppose the crossing of their tracks by such lines.

Mr. LEE testifies that this practice was employed during the earlier history of the pipe lines. The most active opposition to the laying of such pipe lines, however, was manifested when the independent oil interests in Pennsylvania attempted to establish the United States Pipe Line to the seaboard. Mr. Lee's testimony on this point is substantially the same in general import as that of Mr. Emery, given below, but is less detailed. (364, 267.)

Mr. EMERY gives a detailed history of the attempt to lay the United States Pipe Line, of which he was a prime mover and the first president. He states that in 1890 he determined personally to build a line to the coast, if possible, to avoid the excessive transportation charges. He first went to the president of the Reading Railroad with a view to securing a contract for transporting oil by that railroad from Williamsport, Pa., pending the further extension of the line. After some delay he received the reply: "If we give you this contract, we shall disturb our relations with the Standard Oil Trust, and we can not do it." He then determined to lay the line along the boundary of New York and Pennsylvania to Hancock, N. Y., and to secure a contract with the New York, Ontario and Western for transporting oil to the Hudson, with a right to construct a pipe line later along its tracks. This contract having been secured, he approached the Erie Railroad, and was told by Mr. Thomas, its president, that he would be permitted to cross the road at Bradford and to pass under its bridge over the Delaware at Hancock or through the bank of the road.

Meantime Mr. Emery had been employing experts to secure right of way for the pipe line. As soon as the movement became known a number of men, who the witness knows were connected with the Standard Oil Company, began to seek a right of way over this same territory. They bought mortgages against pieces of land along the route to induce the owners to give them another right of way. They bought a number of strips of land in New York, just beyond the Pennsylvania State line, crossing the pipe line. In New York the former free-pipe-line law had been so amended as to be practically ineffective. All these difficulties were, however, finally overcome after great delay and expense.

When the attempt was made, however, to lay the pipe line under the Erie Railroad at Bradford, the witness was surprised to find it opposed by force. His employees drove away the railroad men, but the laying of the pipe was afterwards prevented by injunction of the courts, although it had been intended to cross at the same place where the two Standard pipe lines had been permitted freely to cross. At Hancock also, without warning about such opposition, the men building the new pipe line were met at the bridge of the Erie Railroad with forcible opposition. They remained there 3 months, but were finally compelled to give up the attempt. At the same time the New York, Ontario and Western violated its contract, and the pipe line was finally forced to go back 70 miles, to the Susquehanna River, and to build from Athens to Wilkesbarre. It was necessary to make legal contests for the crossing of every railroad, and the witness comments on the fact that almost identically the same briefs were presented by lawyers of different railroads at different places in their opposition. The various expenses of litigation, loss of time and business, entailed a loss of \$150,000 in reaching this point.

For some time the pipe line transported oil from Wilkesbarre by rail over the New Jersey Central. It then sought to extend its line farther toward the coast. It succeeded in crossing the Pennsylvania Railroad by obtaining ownership of an acre of land. When it reached the Delaware, Lackawanna and Western a farm was bought over which the railroad passed, and it was believed that the line could legally be laid under a culvert where the owner of the land has an undisputed right of passage. Nevertheless the line was built by night, and was strongly secured in place and guarded. The employees of the pipe-line company forcibly prevented a large number of railroad employees from taking up the pipe line. It was arranged that men on each side should be arrested in order to make a peaceable legal fight, but while these proceedings were going on a couple of locomotives

were brought up by the railroad, and hot coals, hot water, stones, etc., were thrown at the men below. The railway employees were finally driven away; the pipe line employees secured arms and held possession of the field for 7 months. The lower courts decided in favor of the pipe line, but after 4 years of litigation the supreme court of New Jersey has decided that the pipe line must be removed. The line does absolutely no harm. The line will ultimately have to build to Philadelphia.

The pipe line company now transports oil from this point 50 miles over the New Jersey Central to the coast. The amount paid for freight is not, as stated by Mr. Archbold, \$6 or \$7 per car, but about \$10 per car, a high rate for that distance. The actual rate is 7.8 cents per barrel on refined and 8½ cents on crude. (650-655.)

Mr. EMERY believes that New Jersey and other States should pass laws allowing pipe lines to be laid wherever desired, by taking land by eminent domain and paying the damages, just as is the practice in laying railways. He has attempted to secure the passage of such an act in New Jersey, but implies that corrupt influences prevented it. (662.)

Mr. PHILLIPS testifies that it was the belief of the independent interests that the opposition to the laying of the United States Pipe Line through New Jersey was instigated by the Standard Oil Company. Mr. William Rockefeller is a director, he has been informed, of the Delaware, Lackawanna and Western Railroad. (593.)

2. *Denial.*—Mr. ARCHBOLD testifies that the opposition of railways, especially the Delaware and Lackawanna, to the crossing of their tracks by the United States Pipe Line Company was not caused by influence of the Standard Oil Company in any way whatever. In this particular case the pipe-line company had carried its line across the railway surreptitiously, on a Sunday, and had then placed an armed force to protect it. The supreme court of New Jersey finally decided that the pipe-line company must remove its line.

The freight rates now received by the United States Pipe Line Company from the terminus of its line to the seaboard, over the Central Railroad of New Jersey, are lower than the Standard Oil Company has ever received for an equal distance.

The crude oil is carried 52½ miles at the rate of \$7.93 per tank car containing 20 tons, and the railroad returns the empty cars free. This contract is for 100 years, and may be abrogated by the pipe line company upon 5 years' notice, the railway having no right to cancel it. Mr. Archbold regards this as a case of discrimination. (513, 520.)

Mr. BOYLE is inclined to believe that the methods used by the Standard Oil Company in opposing the laying of pipe lines by the independent oil men are entirely justifiable. It is just as fair to purchase land in front of a pipe line to prevent its passage as to purchase land desired by a competitor for any other purpose, by offering a higher price than the competitor can afford to pay. The duplication of pipe lines generally is wasteful and inexpedient. (445.)

Mr. BOYLE also cites an instance where the Standard Oil Company itself encountered opposition to the laying of its pipe lines by other refiners. In 1874 the National Transit Company undertook to lay a pipe line from Parkersburg to Macksburg and were stopped at several points by the leasing of land by Mr. Ogle at the instance of Mr. George Rice. Contracts were made with farmers to secure the exclusive right to cross their lands at exorbitant prices. Mr. Rice actually built a pipe line, but not in accordance with these contracts, his sole purpose being to prevent the laying of the Standard's line. (486.)

E. National Transit Company.—1. *Charter.*—The present charter of the National Transit Company is identical in its terms with the charter held by the South Improvement Company. Mr. EMERY submitted the full text of both charters and described the manner in which the National Transit Company secured its charter, proving his statement by official records. On March 22, 1871, a charter was granted to the Overland Contract Company, the incorporators being the same persons who received the charter of the South Improvement Company on May 6, 1871. Both companies were given the powers contained in the charter of the Pennsylvania Company, passed April 7, 1870. The name of the Overland Contract Company was changed, on May 16, 1871, to the Southern Railway Security Company. This company failed to pay taxes on its capital stock to the State of Pennsylvania and in 1873, the amount then due the State being \$18,345, its charter was seized by the State and was held until 1881. At that time it was sold by the State for \$16,251 to individuals who later transferred it to the National Transit Company.

The witness dwelt especially upon the fact that the existing National Transit Company has the same excessively wide powers as were given to the South Improvement Company, and implies that it is abusing these powers in essentially the same manner as that company did. (608, 609, 619-622.)

2. *Efficiency of pipe lines.*—Mr. BOYLE submitted an extract from the Pittsburgh Commercial Gazette of May 5, 1892, showing the manner in which the National Transit Company had met the immense demand for new facilities for storing and transporting oil during the rapid development of the McDonald field in 1891. In July of that year the output of the McDonald field was only about 3,000 barrels daily. By the middle of August it had reached 15,000 barrels, but by the 1st of September the National Transit Company was able to handle 36,000 barrels per day. By the 1st of October it could handle 40,000 barrels per day, and when in November the production of oil reached nearly 80,000 barrels per day the capacity of the pipe lines had been raised above that figure. Iron tankage of the capacity of 3,000,000 barrels was erected during these few months and 53 miles of pipe of different sizes were laid within a territory of 12 square miles. Many powerful pumps were installed to force the oil through the pipes. In round numbers 10,000 tons of iron and other building materials were shipped into the McDonald field for erecting tankage alone.

The witness refers to this experience as showing the necessity of large consolidated capital to meet the exigencies of the oil business. It would not have been possible, even if numerous large pipe lines had existed, growing up under a free pipe-line law, for them to cope with such a sudden demand unless by constant and thorough cooperation. The new independent pipe lines have not shown themselves at all competent to meet the needs of the producers. (471-475.)

3. *Amount of business, etc.*—Mr. ROGERS states that the amount of residuum in the bottom of the tanks of the National Transit Company is published monthly. The company owns about 35,000 miles of pipe, ranging from 2 to 8 inches in diameter. The estimated amount of oil in pipes of 5 inches in diameter and over on October 1, 1899, is 535,528 barrels. The witness submitted the following statement of the credit balances outstanding against the National Transit Company from 1889 to 1899. (583, 584.)

Credit balances in National Transit Company.

[In barrels of crude oil of 42 gallons each.]

Time.	Barrels.	Time.	Barrels.
June 30, 1889	3,217,749.16	December 31, 1891	1,044,255.13
December 31, 1889	3,160,156.81	June 30, 1895	783,502.96
June 30, 1890	3,794,873.84	December 31, 1895	1,809,825.78
December 31, 1890	2,758,654.30	June 30, 1896	3,275,075.49
June 30, 1891	5,406,170.38	December 31, 1896	4,215,060.28
December 31, 1891	3,201,351.34	June 30, 1897	5,113,417.10
June 30, 1892	5,987,319.53	December 31, 1897	4,523,054.39
December 31, 1892	5,532,079.21	June 30, 1898	4,450,703.02
June 30, 1893	4,340,713.15	December 31, 1898	3,422,987.28
December 31, 1893	2,705,563.20	June 30, 1899	4,010,451.22
June 30, 1894	2,453,417.82	September 30, 1899	5,349,302.54

According to Mr. DAVIS, the pipe-line companies (in the Ohio field) have their own experts for gauging tanks, although the producer may have a representative present when the tanks are gauged. The pipe-line company deducts 2½ per cent of the amount of oil received from the producer on account of the waste and evaporation. There is considerable sediment and surplus in the tanks belonging to the Standard Oil Company, but it is supposed that this is partly sold to refiners and partly charged up against producers. When losses by fire occur the producers in the locality are assessed by a reduction of their credit balances, although the witness believes there is no contract authorizing this. (354.)

F. *Effect of pipe-line monopoly.*—1. *Control of competition.*—It was pointed out by several witnesses that the almost complete control of the pipe-line system by the Standard Oil Company gives it great power in fixing the prices of crude oil, since producers can dispose of their product only through the pipe lines, especially in view of the further fact, which is alleged, that railway rates on crude oil are by agreement kept at least as high as, if not higher than, the pipe-line charges. The pipe-line system also gives the combination great advantage over other refiners, who must pay the rates of pipage fixed by the Standard, which are claimed to be excessively high, or the high rates of freight. The evidence in detail as to the arrangements between the railways and the pipe lines is given under the heading "Railway discrimination" (pp. 152-155). The evidence as to pipe-line charges follows. (See also MONNETT, 310, 311, 322.)

2. *Purchase of crude oil by pipe lines.*—The practice of the pipe-line companies controlled by the Standard Oil Company is to receive all oil produced by the wells

with which their pipes are connected, gauging the amount and recording the quantity received from each producer. The producer can then at any time, by the custom of the business, although not by contract, receive from the company the value of his oil in store at the price for that day. He can instead receive "pipe-line certificates" for 1,000 barrels each, which are negotiable in open market. The independent pipe lines apparently follow the same practice and often pay from 1 to 9 cents per barrel more than the Standard Oil Company. (LEE, 285, 286; see also under heading "Crude oil.")

3. *Pipe-line charges.*—Mr. LEE, Mr. PHILLIPS, Mr. EMERY, Mr. DAVIS, and Mr. RICE maintain that the pipe-line charges of the Standard Oil Company are excessive. The rate for local pipage is 20 cents per barrel, and for the transportation of oil to the seaboard 45 cents per barrel. These rates have not been reduced for fully 20 years. The rate charged by the independent pipe-line organizations for local pipage is 15 cents per barrel. (Davis, 381; Emery, 666.)

Mr. PHILLIPS testifies that he has been informed that the cost of transporting oil through the United States Pipe Line, when carrying about half of its capacity, is about 5 cents per barrel as far as the terminal in New Jersey. The cost of gathering oil in the producing field is estimated at from 3 to 5 cents per barrel. (594; confirmed by Emery, 666.)

Mr. LEE points out that the cost of 2-inch pipe has fallen from 35 to 6 cents per foot. He believes the cost of local pipage is from 7 to 8 cents a barrel. (280, 284.)

Mr. RICE believes that the cost of local pipage does not exceed 5 cents and that the cost of pipage to the seaboard is about the same. In proof of this Mr. Rice refers to a paragraph in a contract between the National Transit Company and the Tidewater Pipe Company, referring simply to their local lines. In this contract a division of traffic is arranged for, and it is provided that if either party shall gather by its local lines more than its percentage it shall pay to the other three-fourths of the local charge, i. e., 15 cents on each barrel of such surplus. In accordance with the customary method of pooling, there is a certain implication, although not conclusive, that the actual cost of piping is 5 cents, the profits from the surplus charge above actual cost being paid over to equalize the traffic. (734.)

Mr. ROGERS, president of the National Transit Company, believes that the pipe-line charges of the company, 20 cents per barrel, are reasonable, although they have not been lowered for twenty years. The company undertakes to lay pipe lines without extra charge to new wells, even though 15 or 25 miles distant, if there is a reasonable prospect of considerable production. Such laying of pipes involves considerable risk, since the production may prove slight or may decline. Although the company takes up the pipe lines which are no longer needed and uses the material elsewhere, this involves very considerable expense. The witness does not believe that the independent pipe lines, which make a lower pipage charge, are prepared to furnish facilities wherever demanded; their systems are confined to narrow fields.

The practice of charging the same price to all producers is, on the whole, fair, in view of the constant change of conditions regarding each well.

The witness does not know the actual cost of gathering oil or the profits of the National Transit Company. The charge for carrying oil to the seaboard is 45 cents per barrel, and the witness does not think that anybody knows what the actual cost is.

The cost of pipage in any case does not affect the producers, but comes from the purchasers of oil. The receipts given by the pipe lines apply to oil received at the wells, and are immediately merchantable. (581, 588, 589.)

On being questioned as to the reason why no further reduction in pipage charge had been made, Mr. ARCHBOLD testified that the cost of laying pipes had been sometimes more and sometimes less than before, and that the long distances for which pipes have frequently been laid to reach new fields have involved heavy outlay. (553.)

G. *Rebates and discriminations by pipe lines.*—Mr. BOYLE submitted a series of letters between Mr. R. P. Crawford and Mr. H. McSweeney, and also a letter from Mr. S. C. T. Dodd, solicitor of the Standard Oil Company, all these letters bearing dates during 1884, referring to the matter of rebates granted by the pipe lines during the seventies. In his letter Mr. Dodd states that about 1879 Mr. Crawford and others brought suit against the United Pipe Lines, a Standard organization, asking for forfeiture of its charter on the ground that it had made discriminations in pipage charges between different individuals. Criminal suits on the same ground were brought at the same time. Mr. Dodd found that, so far as any discrimination had existed, it was due to contracts for special rates which had been inherited from

pipe lines absorbed into the United Pipe Line Company, among which was one between Mr. Crawford, for the Bear Creek Oil Company, and the Mutual Pipe Line Company. Such discriminations were believed by Mr. Dodd to be against public policy and he ordered them discontinued. The letters from Mr. Crawford to Mr. McSweeney demand the payment of 5 cents per barrel upon all oil received from certain wells between 1879 and 1884 on the ground of this previous contract with the Mutual Pipe Line Company for a 15-cent rate of pipage. The demand was finally refused by Mr. McSweeney in view of the information furnished by Mr. Dodd in his letter. (476-479.)

H. Immediate shipment.—Mr. BOYLE states that there has been considerable confusion in the public mind in regard to the meaning of the phrase "immediate shipment" in connection with oil. This practice was first resorted to in 1872, but was most prominent during the excessive production in the Bradford field. At this time it was impossible for the pipe line companies to furnish tankage with sufficient rapidity, and it became the custom to take oil for immediate shipment, so that purchasers might come into the market owning tankage and having cars to ship oil and purchase oil at a lower price than prevailed on the regular markets. (482.)

III. INDEPENDENT PIPE LINES AND OTHER ORGANIZATIONS.

A. History of organizations.—Much testimony was given concerning the various organizations recently formed by the independent oil producers and refiners, their relations to one another and to the Standard Oil Company.

According to Mr. BOYLE, these movements grew out of the earlier Producers' Protective Association, which during 1887 and 1888 had formed an agreement among producers and between them and the Standard Oil Company for restricting production. He states that this organization first attempted to build an independent refinery, but impractical men were put in charge and it failed.

The first pipe line company to be organized was the Producers' Oil Company, Limited, which built a pipe line from the refineries in Titusville and Oil City to the new McDonald oil field. The next company to be formed was the Producers and Refiners' Oil Company, which brought in the independent refiners to assist in the movement. According to Mr. Boyle this new company, capitalized at \$250,000, practically took over the property of the Producers' Oil Company, capitalized at \$600,000. It appears from other witnesses also that these two companies are substantially identical, although maintaining separate organizations.

The United States Pipe Line Company was the next to be organized, the purpose being the transportation of both refined and crude oil to the seaboard. The last company formed was the Pure Oil Company, organized in June, 1895. Mr. Boyle declares that previous to the formation of this company an attempt had been made to combine the other independent organizations, which was checked by suit of some of their stockholders. One of the chief purposes of the new company was to secure control of the other two companies. It was organized as a New Jersey corporation in 1897, with an authorized capital of \$1,000,000, of which about \$377,000 has been paid in. (462,464.)

The testimony of Mr. Boyle concerning the organization of the Pure Oil Company and its purpose of securing control of the stock of the other independent companies is confirmed in most particulars by Mr. LEE, and especially by Mr. PHILLIPS, who said that the four independent organizations are practically controlled by the same individuals. The persons who took stock in the first company were also stockholders in the others. The purpose of the organization of the Pure Oil Company is largely to prevent the Standard Oil Company from securing control of any of the other independent organizations, as it has repeatedly attempted to do. It is expected that ultimately a majority of the stock of each of the other companies will be held by the Pure Oil Company. It has been proposed to increase the capital of the company to \$10,000,000. The Pure Oil Company is also engaged in marketing refined oil, and has been specially successful in Germany. (Lee, 261; Phillips, 596.)

B. Character of independent organizations—Voting trust.—There was considerable controversy between the witnesses defending the Standard Oil Company and those opposing it as to the precise character of the Pure Oil Company. Mr. Boyle and Mr. Archbold declared that it was a trust of the closest possible kind, basing this statement both upon the fact that it was seeking to combine other corporations, and especially upon the fact that its stock has been put in control of a voting trust.

1. Text of agreement of Pure Oil Company.—Mr. BOYLE and Mr. ARCHBOLD each cited in full the former voting-trust agreement of the Pure Oil Company. Mr.

LEE later furnished the commission with a copy of the present voting trust agreement, which contains some important changes from the earlier one. (464-466, 508-513.)

This agreement states that the purpose of its formation is to prevent at all times a diversion of the resources and business of the Pure Oil Company from their intended use and courses, in opposition to monopoly in the business, and to permanently protect and maintain what are known as the independent interests in the petroleum industry. The holders of 16,000 shares, being more than a majority, vest the voting power of such shares in 15 persons for 20 years, and it is agreed that one-half of all shares hereafter subscribed shall similarly be transferred to the trustees. The ownership of the shares may be transferred, but this shall not give to purchasers any right other than provided in the trust agreement. The trustees are to vote for the election of all directors to the full number of shares so held, as a unit. In case of difference of opinion among the trustees a four-fifths vote of the shares held in trust shall decide the matter. One-third of the trustees retire annually and their successors are elected by the general stockholders. Any trustee may be summarily removed by three-fifths of the trustees together with three-fifths of the shareholders in trust. By similar vote, but in no other way, the trust agreement may be modified.

2. *Rules of Pure Oil Company.*—Mr. BOYLE also submitted the by-laws and regulations of the Pure Oil Company. The following quotations will give a clearer idea of the precise nature of this organization. They show clearly the purpose of the Pure Oil Company to acquire control of other corporations, and to prevent the stocks of such corporations from falling under the control of outside interests.

"1. The business of the company shall be the producing, purchasing, transporting, storing, and selling of crude petroleum and its products, and aiding other companies and parties in the production, transportation, storage, manufacturing, and sale of the same. The corporation may acquire, hold, manage, and dispose of any stocks, shares, bonds, and other interests in or issued by any corporation, joint stock company, or limited partnership association engaged in, or aiding, or promoting the producing, transporting, storing, refining, and selling of crude petroleum or its products, or in any business incident thereto."

"5. Interests of the company will be represented by shares which may be divided into classes, including preferred, common, and deferred shares, to be issued, held, and transferred, subject to the by-laws and regulations of the company."

"6. A majority of all the shares of the company shall be held in a permanent trust approved by all the shareholders, to secure the control of the company and the faithful maintenance of the policy agreed on for conducting the business of the company in the interest and for the protection of all concerned in its affairs. The shares so held shall be designated as trust shares."

"8. No preferred stock shall be issued except as cash to the extent of one hundred dollars for each share of such stock issued shall be paid into the treasury of the company to the credit of capital, or of surplus, or of the guaranty and redemption fund, to be created as prescribed in section 12 hereof, as may be deemed advisable."

"9. The deferred shares of the company may be issued for cash, investment securities, property, services, payment of expenses, making disbursements of any kind, and in exchange for shares of other classes issued by the company at the discretion of the directors, with the written consent of the owners of a majority of the shares of the company at the time outstanding.

"10. The holders of preferred stock shall be entitled to receive cumulative dividends thereon of one dollar and a half per share quarterly, in full, before any dividend shall be payable on the common stock."

"12. The guaranty and redemption fund shall be applicable to the general uses of the company, but may be applied to buying shares of all classes, in the order of their priority or right to dividend, as stipulated, at the lowest rates at which any shares of the same class can be bought, not over one hundred and ten dollars per share, on demand of the several owners and holders of shares, respectively, made within a prescribed time after the payment of dividends."

"13. * * * The shares of any class so purchased may, when authorized by the owners of a majority of all the shares of the company, be resold at any time, at the discretion of the directors, at any price not less than that at which they were severally purchased; or they may be retired from the classes to which they belong, and be placed in the treasury of the company, to be held, reissued, and sold for its use and benefit, subject to such conditions as the directors may prescribe, in accordance with the regulations of the company."

"15. The owners of a majority of the trust shares, acting together, shall have the right to convey to the company, absolutely or in trust, permanently or temporarily, and subject to such conditions as may be stipulated in such transfer, any securities regularly yielding net income, provided that the receiving and holding of such securities shall not subject the company to any prejudice, or embarrassment, or legal liability to pay any money on account thereof; and no such temporary transfer in trust shall be terminable until the well-established net income of the company from its regular business and other sources of permanent revenue shall be equal to the maximum amount to which it may be raised by such temporary transfer in trust." (466-470.)

3. "*Trust*" character of *Pure Oil Company*.—On the basis of this voting trust agreement Mr. BOYLE and Mr. ARCHBOLD declare that the organization of the Standard Oil Company was fully as justifiable in its nature as that of the Pure Oil Company, and that the latter is as much a trust as the former ever was. Mr. Boyle especially emphasizes the clause seeking to make the voting trust, as he states, perpetual, by providing that it may be dissolved only by the winding up of the Pure Oil Company, or by the consent of the equitable owners of four-fifths of the shares held in trust, together with four-fifths of all other shares of the company, after providing for the redemption of all preferred and common shares of the company then outstanding at \$110 per share. It is to be noticed, however, that this clause is modified by the new voting-trust agreement, which provides that the trust may be canceled by a vote of three-fifths of both classes of shareholders, on the redemption of the preferred shares only, at \$110 per share. Moreover the charter of the company itself expires in 46 years. (Boyle, 443-463; Archbold, 507.)

4. *Denial of "trust" character*.—Mr. PHILLIPS and Mr. EMERY are exceedingly emphatic in denying that the Pure Oil Company is a trust in any such sense as the Standard Oil Company is. The sole duty of the trustees, as holders of a majority of the shares, is to vote along with other stockholders in electing directors. The directors manage the affairs of the company. The large number of the trustees, 15, is due to a desire to make the body representative of the interests of the oil country.

The formation of the voting trust was rendered absolutely necessary by the attempt of the Standard Oil Company, through the National Transit Company, to secure control of the Producers' Oil Company and the United States Pipe Line Company, through the purchase of shares—a transaction which Mr. Phillips describes fully.

The Pure Oil Company was not organized for the purpose of securing a monopoly, as the Standard Oil Company was, but to prevent a monopoly and to preserve competition in the petroleum industry. It is not the purpose of the Pure Oil Company to get control of any other person's business or to absorb its competitors, but merely to put the business of its own constituents in such a form as to prevent its destruction. The company and its members desire only a fair portion of the oil business, not the whole of it. If it were possible for this company to obtain a monopoly of the entire market, Mr. Phillips would not desire to be connected with it; the responsibility would be too great. Although the Standard Oil Company does not control the entire industry, yet its control over 80 per cent of it is sufficient to constitute a monopoly and to enable it to fix prices. The Pure Oil Company, on the other hand, has none of the characteristics of a trust in the sense of an industrial combination or monopoly, as defined in statutes, dictionaries, and common thought. (Phillips, 589-591, 595-598, 600; Emery, 657, 658.)

Mr. EMERY added also that the independents feared that when the voting trust of the United States Pipe Line expires, as it will in a short time, the Standard Oil Company will secure control of still more of its stock and attempt to control it. This is one of the motives for the organization of the Pure Oil Company, and the attempt to secure control through it of the stock of the other independent corporations. It has not yet, however, been decided finally that the Pure Oil Company shall consolidate the others, but it is being seriously discussed. (657, 659.)

5. *Voting trust of United States Pipe Line Company*.—Mr. ARCHBOLD also cited in full the voting-trust agreement of the United States Pipe Line Company. This agreement states that the voting trust is created in view of the fact that the company is organized by persons each interested pecuniarily in the oil business, and for the purpose of securing and furnishing to each an independent outlet for his products, both crude and refined, not controlled or influenced by others hostile to their respective business interests. In order to keep the control of the stocks of the

company in hands friendly to the independent interests, the signers of the agreement vest their respective interests in the stocks of the company in A. D. Wood as trustee for the period of 5 years from April 1, 1893, unless sooner terminated by a vote of three-fourths of the stocks so held in trust. No sales of stocks so held in trust shall be made by the equitable owner thereof during the continuance of the trust. The trustee has the full power to elect officers, but is bound to vote for persons interested in the business of refining, producing, and exporting oil, and to fulfill the general purpose of the contract. (507 508.)

Mr. EMERY replies to this that the voting-trust arrangement of this company also was rendered necessary by the attempts of the Standard Oil Company to control it. (656.)

C. Attempts of Standard to control independent pipe lines.—Mr. LEE, Mr. PHILLIPS, Mr. EMERY, and others testify that the Standard Oil Company has made attempts to secure control of all of the independent pipe lines and organizations and of the Pure Oil Company by purchasing their stock. Through the National Transit Company it secured a large proportion of the shares of the Producers' Oil Company, Limited, and placed them in the name of John J. Carter. He brought suit to secure a right to a voice in the organization, but since it was a limited partnership, the courts upheld the rights of the company to deny him admission. The Standard Oil Company purchased, through the National Transit Company, \$388,000 of the capital stock of the United States Pipe Line Company, and has successfully brought suit to secure the right to vote this stock. (Lee, 270.)

Mr. DAVIS, who speaks from information rather than from personal knowledge, gives essentially the same facts.

He adds that the Standard Oil Company has bought up a considerable number of oil wells along the independent pipe line of the Producers and Refiners' Oil Company, forcing it to lay longer pipe lines to other wells. The Standard paid high prices for these wells. (380, 382.)

Mr. ARCHBOLD admits these purchases of stock in the Producers' Oil Company and in the United States Pipe Line. They were made as an investment, "and with a view to having such knowledge as we could have rightfully through such ownership—as we should acquire in the progress of the affair." The proportion held by the Standard Oil Company was actually less than one-half in each case. The company was so opposed in the exercise of its ownership in the Producers' Oil Company that it sold out to Mr. Carter. This sale was in good faith and the Standard had no control over the stock after the transfer. At one time Mr. Carter did own more than a majority of the stock, but under the Pennsylvania law, which the witness considers "a very queer one," the courts held that he could have no voice in the company, which was a limited partnership, without its consent.

The courts have upheld the ownership of the Standard Oil Company in the United States Pipe Line, and it is recognized on the board of directors. It has never done anything to injure the business of that company, and "if that iniquitous voting trust is ever dissolved the shareholders will awake to a feeling that somebody else than those who have managed it could do something for it." (577, 578.)

Mr. ROGERS confirms the testimony of Mr. Archbold generally on this subject, although he is uncertain as to the proportion of the stock of the Producers' Oil Company held by the Standard and by Mr. Carter. He does not know whether Mr. Carter was furnished the money to buy this stock by a trust company in New York to which he was introduced by the Standard Oil Company, although it is possible. (584, 585.)

Mr. PHILLIPS's description of the purchases of stock in the independent pipe lines by the National Transit Company differs from that of Mr. Archbold in certain details. As high as \$20 was paid for stock in the Producers' Oil Company, although it was then earning no profits. In March, 1894, before the time when the Standard claims to have sold its stock to Mr. Carter, it turned over the stock to him temporarily, and he attempted to vote it at an important meeting. On January 16, 1896, he claimed that he bought this stock from the National Transit Company. On the trial of the suit by which he attempted to secure admission to the company it was proved that he had borrowed the \$300,000 for the purpose from a trust company in New York; and when questioned Mr. Archbold and other agents of the Standard Oil Company declined to answer regarding the ownership of that money. (590.)

Mr. PHILLIPS testifies that the amount of the stock of the United States Pipe Line Company secured by the National Transit Company was \$383,000 out of a total

of \$1,190,000. When suit was brought to secure the right of attending the meetings of the company and of voting the stock, which had been refused by unanimous vote of the other stockholders, the lower court decided in favor of the National Transit Company. The suit was never tried on its merits in the supreme court of Pennsylvania, but the appeal was quashed on a technicality. The Standard Oil Company takes advantage of its one director upon the board of the United States Pipe Line Company to secure information and to injure that company. This testimony is confirmed by Mr. Emery (p. 656).

Regarding a letter submitted to the commission declaring that, through its ownership of stock in the independent companies, the Standard Oil Company had brought them into virtual harmony with itself, Mr. Phillips denied the charge entirely. (590, 595, 596.)

D. Propositions for combination with Standard.—1. *Facts as to such propositions.*—In connection with the attempts of the Standard Oil Company to get control of the present independent interests, Mr. ARCHBOLD testifies that approaches with a view to combination with the Standard have been made from the side of the independents. Nearly every prominent independent, including Mr. Lee, Mr. Phillips, Mr. King, and others, has made some proposition or advance looking toward a combination of interests, but the Standard Oil Company has declined, believing such combination to be illegal, and lacking faith in the men proposing it. Mr. Archbold denies specifically that the Standard ever sent an agent to propose a combination. On being questioned as to whether such advances on the part of the independents were not forced upon them by the fact that the Standard had secured control of a large part of the stock of their pipe-line companies, as well as by the crippling of their business in Germany, Mr. Archbold states that he believes that these matters had nothing to do with the proposition. He says that the proposition was simply for a division of business, so that each interest should have a share of the market; not for sale to the Standard Oil Company. (530, 531, 548.)

Mr. PHILLIPS replies to these statements of Mr. Archbold that it is true that 3 or 4 years ago he himself and certain others did call upon the officers of the Standard Oil Company. This was after the Standard had bought up a number of the independent refineries connected with the independent pipe lines, and also large amounts of the stock of the independent pipe lines. The Standard also was making every possible effort to prevent the independents from marketing oil in Germany, and had bought out Mr. Poth, who had been acting for the independents there. The independents sought simply to obtain cessation of hostilities. In lieu thereof the Standard Oil Company proposed to buy the pipe-line system, and when this was refused one of its officers, proposed to buy the producing territory of these independents, which was also refused. There have been no recent overtures by the independents to the Standard Oil Company.

Mr. Phillips states further that the Standard Oil Company has frequently sought to secure the moral support of independent refiners and producers, or to withdraw them from opposition, by buying their property and otherwise. The Standard Oil Company once bought from Mr. Phillips a large amount of oil lands and attempted to influence him at the same time to consent to cease all opposition to that company. Certain of the refiners who have been bought out have been given positions in connection with the Standard Oil Company. (593, 594.)

Mr. EMERY also testifies that there has been no proposition on the part of the independent pipe lines to combine with the Standard Oil Company. At the time when he was president of the United States Pipe Line Company a resolution was passed for the appointment of a committee to confer with the Standard Oil Company to ascertain if some arrangement could not be made by which it would permit that pipe line to be laid under the railroads. The resolution did not give any authority to discuss the sale of any portion of the property, and the witness is sure that the committee made no such propositions. (659.)

As to opposition to crossing of railways, etc., see above, pp. 103, 104.

2. *Reasons for refusing to combine with Standard.*—Mr. LEE testifies that a Pennsylvania law formerly prohibited the consolidation of competing pipe lines, but the Standard Oil Company secured its repeal in 1895. The independent local and seaboard pipe line could sell out at a high valuation to the Standard Oil Company, but they are largely owned by the producers of crude petroleum, who believe that the price of their product is increased by the competition of these pipe lines and of the independent refiners who secure their oil from them. The owners of from 40 to 50 per cent, probably, of the crude production are shareholders in these pipe lines. (298.)

Mr. PHILLIPS declares that the producers of crude oil who are interested in the independent pipe lines feel that they can not afford to allow the stock to pass into the hands of the Standard Oil Company at any price. He is unable to state the value of their stocks, but since the Pure Oil Company has succeeded in getting a fair market in Germany, he considers them very valuable, especially for the reasons already cited.

Mr. Phillips further states that the producers of crude oil are undoubtedly receiving much higher prices, probably 25 cents per barrel, on account of the competition of the independent lines with the Standard in purchasing oil. During the time when the Standard was cutting prices most severely against the independent refiners the independent pipe lines reduced their charges, the producers making the sacrifice for the benefit of the refiners. The independent line has, however, never paid producers less than the Standard was paying, and has frequently taken the initiative in advancing prices from 1 to 5 cents per barrel.

There is no doubt, also, that the independent refiners are much better off because of these pipe lines; in fact, without them none would be in existence to-day. The producers and refiners have united for mutual protection. (590, 598, 599.)

E. Effects of independent movements on producers and refiners.—The reasons just stated by the defenders of the independent pipe-line organizations for their refusal to sell to the Standard Oil Company point out the beneficial effect of these pipe lines upon producers and refiners.

This beneficial effect is denied by Mr. BOYLE. He believes on the whole that these independent lines have been wasteful. They have not paid dividends, save a single dividend of 5 per cent by the United States Pipe Line at a time when it had no fixed charges for indebtedness; so that the capital invested in them has been to that extent a burden on the oil industry. The Producers' Pipe Line has not sufficient capital back of it to enable it to handle large quantities of oil with the rapidity and certainty with which the Standard Oil Company can do so. Thus the first pipe line built by the independent organization into the McDonald field in 1891 reached only a few wells on the outskirts of that field, while the National Transit Company, controlled by the Standard Oil Company, was forced to build new tanks and lay pipes with enormous rapidity to keep pace with the exceedingly rapid development of that field. On the whole, apparently, the producers, so far as they are actually reached by the independent pipe lines, have, in Mr. Boyle's judgment, profited somewhat by the higher prices for oil. The independent pipe lines pay from 1 to 9 cents per barrel more than the Standard Oil agency, so that the real charge for pipage, which is nominally 15 cents per barrel, may fall to 6 cents as compared with the 20 cents charged by the Standard Oil Company. But what is thus gained by the producers is lost by them in the failure to receive dividends from their investments in the pipe lines.

The independent pipe lines have not had the effect of reducing the price of refined oil, nor have they in any way benefited consumers. They have enabled independent refiners to make money much faster than ever before.

Mr. Boyle does not consider that the transportation of refined oil by means of a pipe line is an achievement of any particular significance. (441-445, 474.)

IV. METHODS OF ATTACKING COMPETING REFINERIES AND DEALERS.

A. Special cuts in particular places.—*1. Evidence of opponents of combination.*—Several witnesses make the broad statement that it is the practice of the Standard Oil Company to attack its competitors by making special reductions in prices in the places where they seek to do business, while maintaining prices at higher rates at noncompetitive points, and also by special cuts to individual customers. These witnesses testify that the Standard Oil Company often secures full information as to shipments by its competitors and as to the persons who are their customers, and use this information to drive them out of business. Where a dealer purchases oil from independent refineries, the Standard Oil Company sometimes establishes competing dealers or threatens to do so. (LEE, 277; LOCKWOOD, 401-402; MONNETT, 317.)

Many specific statements on this subject were made by the different witnesses, a summary of which follows:

Mr. MONNETT, attorney-general of Ohio, submitted the following list of prices at competing and noncompeting points in the State of Michigan (317):

Name of town and State.	Condition of trade.	Price of kerosene.	Price of gasoline.
		Cents.	Cents.
Detroit, Mich.	Competition	5.5	7
Adrian, Mich.	No competition	8	
Ann Arbor, Mich.	do	7.75	
Clifford, Mich.	do	8	
Howell, Mich.	do	8	
Grand Rapids, Mich.	Competition	5.5	6.25
Monroe, Mich.	No competition	7.5	8.75
Kalamazoo, Mich.	Competition	5.5	
Bay City, Mich.	No competition	7.75	
Lansing, Mich.	Competition	6	7.25
Coldwater, Mich.	No competition	8.25	
Jackson, Mich.	Competition	6.5	7.75
Saginaw, Mich.	do	8	
Mount Clement, Mich.	No competition	8	8.5
Marlette, Mich.	do	8	
Muskogon, Mich.	do	8	
Battle Creek, Mich.	Competition	6.25	
Benton Harbor, Mich.	No competition	7.25	
Cleveland, Ohio.	Competition	4.75	6
Sidney, Ohio.	No competition	8.75	10
Dayton, Ohio.	Competition	6.5	6.5
Xenia, Ohio.	No competition	8	
Hamilton, Ohio.	do	7.5	
Oberlin, Ohio.	do	7.5	
Troy, Ohio.	do	7	
Youngstown, Ohio.	Competition	6	
Canton, Ohio.	do	6	
Warren, Ohio.	do	5.75	
Galion, Ohio.	No competition	8	
Newark, Ohio.	do	8	

Among the leading competitive points are New York, Philadelphia, Pittsburg, Chicago, Milwaukee, Rock Island, Evansville, Memphis, St. Louis, Des Moines, and Kansas City. Competition is seldom possible, except where there is water transportation competing with the railways. The independents have little opportunity on the Pacific coast on account of the rules of the railways. (LEE, 269.)

Mr. EMERY is emphatic in his testimony on this point. He himself attempted to distribute oil in Philadelphia between 1891 and 1896, but lost more than \$50,000 on account of the cutting of prices by the Standard Oil Company. He was forced to sell oil at 3 cents per gallon when it was being sold in New York at 8 cents. Within 4 weeks before the time he testified he had sent oil to a certain point and the Standard Oil Company had reduced the price 1 cent per gallon at that point immediately.

The Standard Oil Company employs persons to watch the business of its competitors, and often sends in advance, when it learns that a shipment of oil has been made to a particular market, and cuts the price before the oil arrives there. The witness makes this statement from his personal experience. It is confirmed broadly by Mr. Lee. (277.)

In certain cases the first cuts in prices are made by the competitors of the Standard Oil Company. This is sometimes necessary where a customer declares that he is in the habit of buying from the Standard or prefers to do so. Ordinarily the aim of the witness and of other independent refiners is to maintain prices, merely securing a fair proportion of the business, and the beginning of cutting usually comes from the other side. (629-632.)

2. *Competition at New York City.*—Mr. LEE testifies that in New York, Brooklyn, and Jersey City, in March, 1896, the price to local dealers was 9 to 9½ cents per gallon, while the witness maintains that 7 cents would have paid a handsome profit. When the Pure Oil Company began marketing oil in opposition, the Standard Company cut the price to 5½ cents per gallon, where it has remained practically unchanged. The decline in the price of crude oil at the same time was scarcely more than 10 per cent. A similar experience was met with in Philadelphia, where prices are now even lower than in New York. The purpose of these excessive cuts was to destroy the competitors. The number of competitive points, however, is increasing as the independent interest is growing in strength. These points are usually at a great disadvantage in rates of transportation. (265-266.)

Mr. WESTGATE corroborates the testimony of Mr. Lee as to the cutting of prices below cost in New York City and Philadelphia after the Pure Oil Company began business there. Prices were reduced from March 20 to April 4, 1896, from 9½ to 7 cents. Oil is still sold at a loss there. (365.)

Referring to the above testimony of Mr. Lee, Mr. ARCHBOLD testifies that the average price of refined oil to retail dealers during March, 1896, was 7.98 cents, instead of from 9 to 9½ cents per gallon. In the same month the average price of crude oil per barrel at the wells was \$1.42. In April the Standard Oil Company's price for refined oil in New York was 7.31 cents, the price of crude being \$1.22. In May, refined 6.94 cents, crude \$1.14; in June, refined 6.72 cents, crude \$1.15; in July, refined 6.23 cents, crude \$1.09. No oil was sold at 5½ cents per gallon, as stated. It would be entirely impossible to make considerable variations in price between different customers. Such variations would very soon be made known, and the practice would be dishonest. (The figures above shown appear to indicate that the reduction in the price of refined oil during the period referred to was about twice as great as the reduction in crude. A fall from \$1.42 to \$1.09 per barrel amounts to approximately three-fourths cent per gallon, while the fall in the average price of refined oil was 1.65 cents.) (Archbold, 528, 529.)

3. *New York State, etc.*—Mr. WESTGATE has found that the Standard Oil Company will not cut prices where he does only a limited proportion of the business in any particular place. Thus at Syracuse the prevailing price of water-white oil has recently been 7½ cents a gallon, and the witness handles only about one-tenth of the business. But at Auburn, 25 miles south, the price has been about 2 cents less, because the witness has attempted to handle one-third or one-half of the trade. He has found it his best policy to compete on a small scale. He knows of one instance, however, where an independent refiner sent a barrel of oil as a gift to a friend in Maryland, not for selling but for his own use. The Standard Oil Company discovered the shipment, and sent at once a carload of what was considered the best oil the people there had ever received, at the same time making a heavy cut in price.

The witness cited the following as specific instances of special cuts made by the Standard Oil Company to customers of independent refiners. A letter to him from Shortsville, N. Y., March 23, 1899, from a firm dealing in oil, states that an agent of the Standard Oil Company had said to one of their customers that the Standard was going to force them to buy oil from it, and had cut the price of oil to 7 cents (it had formerly been 10). The witness was accordingly compelled to furnish oil to this firm at such a figure that it should not lose money, which took away all his profit. The witness also submitted a letter sent by the agent of the Standard Oil Company at Portland, Oreg., to a dealer in South Bend, Wash., who had informed the agent that oil manufactured by the witness was being sold there. The letter states: "You can rest assured that if another carload of Sunlight oil arrives at your place it will be sold very cheap. We do not propose to allow another carload to come into that territory unless it comes and is put on the market at one-half its actual cost. You can convey this idea to the young man who imported the carload of Sunlight oil." The letter is signed "Standard Oil Company, by George C. Flanders." In Hoboken, N. J., a threat was made against a German dealer that his business would be ruined unless he bought Standard oil, which was offered to him at cut prices. He declared that he would blow up the Standard warehouse with dynamite if his business was ruined, and the Standard agent made an arrangement to furnish him oil, while still allowing him to handle independent oil. At Fulton, N. Y., the Standard established retail peddlers to drive out a man who was peddling Mr. Westgate's oil. To compete the more effectively, they furnished their men with Mr. Westgate's own oil, bought through other parties, and they cut the price from 1 cent to 4 cents a gallon. (366-370.)

Mr. ARCHBOLD replies to these charges by stating that the peddler at Fulton, N. Y., referred to by Mr. Westgate, had been enticed away from the Standard Oil Company, and was cutting prices against that company so that it was forced to put on a competing peddler.

The man at Hoboken referred to by Mr. Westgate was a man of violent temper and an anarchist. He has not been in the oil business for a number of years. The agent of the Standard Oil Company at Jersey City denies having threatened him with a cut of prices, and also having come to any agreement or understanding with him.

As to the letter written by Mr. Flanders to a dealer of South Bend, Wash., it was a foolish action, for which Mr. Flanders had no authority whatever. The letter was in fact intended to be jocular and to deny a claim that he was selling oil of an inferior quality, a charge which is often brought against the Standard Oil Company unjustly. (549-552.)

4. *Southern States.*—Mr. RICE testifies that he has been engaged in refining petroleum since 1876 at Marietta, Ohio. He has repeatedly been driven out of various local markets which he has sought, especially in the South, by special cuts made by the Standard Oil Company in particular towns and to particular customers. He declares that the Standard Oil Company has temporarily cut prices below cost to his particular customers, leaving the prices unchanged to nine-tenths of the dealers in town. "They can clean me out on any one car I may send to any one town."

The Standard Oil Company has also made threats against dealers handling Mr. Rice's oil. At one time the Chess Carley Company wrote to Mr. Rice's agents at Nashville, Wilkinson & Co., threatening to establish a grocery store and cut prices on all goods as well as on oil. The company did afterwards set up a grocery store at Columbus, Miss., in order to force merchants to buy its oil. In 1885 the Chess Carley Company made a contract with R. M. Ong, of New Orleans, a copy of which was submitted by the witness in evidence, with a declaration that it was undoubtedly genuine. By this contract Mr. Ong was to be paid a sum of \$48,000 in monthly payments during 5 years. In exchange therefor he sold to the Chess Carley Company the entire profits of the business on illuminating oils and other petroleum products. He was himself to conduct the business and to make no charge except for drayage actually paid out. Mr. Ong agreed to sell no petroleum not supplied by the Chess Carley Company, and to conduct this branch of the business in the best manner possible to promote the interest of that company, and under its general directions. (704-709, 711.)

Regarding the above testimony of Mr. Rice, Mr. PAGE states that the Chess Carley Company did actually establish one such grocery store at Columbus, Miss., but no other. This was before the Standard Oil Company possessed complete control of the Chess Carley Company, and the witness believes that the Standard itself has never made any such threats or actually established competing stores. (764.)

5. *Competition in Ohio.*—Mr. Clark testified that he had been employed as a warehouseman by the Standard Oil Company in Marietta, Ohio, and later at Springfield as a country tank-wagon man, at Columbus as cashier, at Urbana as manager for the Standard Oil Company at that place, and finally at Newark as manager, the latter station being much more important than Urbana. The witness gave the following account of the reasons for his leaving the employ of the Standard Oil Company:

The Standard Oil Company has in Ohio an inspector, Mr. Lockwood, who goes over three States, inspecting the condition of the various stations, the work of the agents, etc. The form of inspection report is given by the witness. When this inspector visited the witness during his agency at Newark, at one time the witness was in a bad humor and, not knowing the official position of the inspector, he objected to receiving suggestions from him. This led to his being suspended, although he was told that this was not a discharge. Suggestions have since been made by the Standard Oil Company with a view to taking him back, but the witness is unwilling to return. He objects especially to the practice of deducting from the salary of the agent any losses due to errors, whether of himself or of others. (842, 844.)

Mr. MATHEWS, selling agent of the Standard Oil Company for the central and southern parts of Ohio, testifies in detail in refutation of the evidence of Mr. Clark. He states that Mr. Clark's evidence was obviously prompted by spite, owing to the fact that he had been dismissed from the service of the Standard Oil Company on account of a shortage in his accounts and not for the reason stated by Mr. Clark in his testimony. The inspector referred to by Mr. Clark as having visited his station at Newark was the traveling auditor and had nothing to do with the regular inspecting system. Mr. Clark had been negligent in sending in his regular reports and on investigation was found to be short in his accounts. The final amount of shortage was \$281, part of which was made up by Mr. Clark and the remainder by his bondsmen. He would have been indicted by the grand jury for embezzlement save for the fact that the various items taken were small and could not be joined together in the indictment, so that the offense was only petty larceny.

Mr. Mathews testifies further that Mr. Clark never held such responsible positions under the Standard Oil Company at various places as he claimed. He had not had the opportunity to be familiar with details of business concerning which he testified.

Neither Mr. Mathews nor any other employee of the Standard Oil Company has made propositions to Mr. Clark with a view to reengaging him in the company's service. An affidavit by Mr. Foutz to this effect was submitted. (491, 504, 505.)

Mr. CLARK states that in Ohio no two stations have the same price for oil, and

the differences are not due solely to freight rates. At competitive points the prices are considerably lower. Thus in 1898 the price of gasoline at Newark, where there was no competition, was 7½ cents, while at Columbus, under competition, it was 5½ cents. At the same time oil was about 2 cents cheaper at Marietta than at Newark, although there was no difference in the conditions of competition. When competition has been driven out, prices are raised to the old high level or to one still higher. Thus at Newark at one time oil was sold as low as 4 cents, but afterwards was raised to 13 or 14 cents. The Standard Oil Company, where it has to meet competition, usually keeps oil at a somewhat lower price than its competitors. There may be times when its price is higher, but the average is lower. Many dealers are willing to pay more for independent than for Standard oil. (345, 346, 349, 350.)

While Mr. CLARK was employed by the Standard Oil Company at Marietta, the company hired a man named Davis to compete with a tank-wagon driver named Curtis, who had been buying oil of the independent Argan Refining Company. He was furnished a horse and wagon and sold oil so cheap that the competitor had to come to the Standard company to arrange to buy oil from it. The price had been 7 cents during this competition, but was then raised to 12 cents. The competitor again began to buy Argan oil, and was again brought back to the Standard company by the employment of a Mr. Elbright, who "played the farmer racket" in selling against Mr. Curtis. (331.)

Concerning the alleged fraudulent methods of competition at Marietta, Ohio, testified to by Mr. Clark, Mr. MATHEWS states (substantiating his evidence by a certified transcript from the testimony of William Elbright and by an affidavit of W. A. Reed, local agent at Marietta when Clark was employed there) that Mr. Clark was then only an office and warehouse boy, entirely unfamiliar with the conduct of the business, and that his evidence was untrue and malicious in every particular. The man Davis referred to was not employed by the Standard Oil Company at any time. He was an independent oil peddler and bought oil outright at the ruling market prices from the Standard Oil Company, selling it at prices fixed entirely by himself. The man Elbright was in precisely the same position as Mr. Davis. It was not true that he pretended to be a farmer or otherwise deceived concerning his character in business. (491-492.)

While Mr. CLARK was manager for the Standard Oil Company at Urbana, Ohio, a man named Helmick, whose father had been 20 years a dealer in oil, established a competing business, buying oil from the Cleveland Refining Company. The witness, accompanied by two traveling agents of the Standard, visited Mr. Helmick and threatened him with excessive cuts in prices. Some cuts were actually made, from 8 to 6 cents, and through these and the threats the competitor was forced to give up business and finally went to the poorhouse. He had put up a building to handle oil and this was an entire loss. The witness believes that this excessive competition by the Standard was the cause of his failure, not his own incompetence. (337, 338.)

Mr. MATHEWS, replying to this testimony of Mr. Clark, states that Mr. Helmick bought only one carload of oil from independent dealers, and after he had sold about one-half of it became satisfied that he would lose money on account of leakage and poor quality, and the Standard Oil Company took the remainder off his hands. The Standard Oil Company did not drop prices while Mr. Helmick was in business, nor were threats made by the two agents of the Standard Oil Company referred to by Mr. Clark. Both of these agents submitted affidavits denying Mr. Clark's allegations. Mr. Hurley, a notary public, also submitted an affidavit that he had seen Mr. Helmick and that the latter had declared the testimony of Mr. Clark in reference to himself untrue, especially in regard to the cause of his going to the poorhouse. Another affidavit shows that Mr. Helmick continued in the oil business about 2 years after the time referred to by Mr. Clark; that he afterwards went to the poorhouse, but that on August 31, 1899, he was employed in a canning factory at Wapello, Iowa. Mr. Cone, a township trustee of Urbana township, furnished an affidavit that he believed Mr. Helmick's going to the poorhouse was due to the extravagance of his family and other domestic troubles. Mr. Powers, a drayman who had hauled oil to Mr. Helmick's building, stated that it was a mere shed built of refuse lumber and not worth more than \$10. (496-499.)

Mr. CLARK states further that at Columbus, while he was employed by the Standard Oil Company, one Shoemaker was hired at a regular salary and furnished oil at prices so low that he could undersell representatives of the Cleveland Refining Company. Customers supposed that he was an independent dealer. A boy was also hired to watch the tank cars received by competitors and the amount of oil sold. The prices were then cut so that the competing dealers were forced to agree to maintain prices at a fixed point. (334, 335.)

All these statements are denied by Mr. MATHEWS in detail. (496.)

While Mr. CLARK was agent of the Standard Oil Company at Newark, a Mr. Donaldson started business, buying oil from the independent firm of Scofield, Shurmer & Teagle. The witness was told that he should have a 2 weeks' vacation if he would get rid of this competitor. He became friendly with the owner of the shed where Mr. Donaldson stored his oil, promised him work for the Standard Oil Company, and succeeded in buying the shed, in the absence of Mr. Donaldson, for \$2.50. He removed the barrels and tanks and had the shed hauled away. While Mr. Donaldson was competing, a boy had been hired to follow his wagon and discover his customers. Mr. Mathews, the canvassing agent of the Standard Oil Company, would then visit these customers, test the quality of oil in their lamps, and offer oil at reduced prices. The Standard Oil Company also, after buying the shed, hired the driver formerly employed by Mr. Donaldson and had him deliver oil to Mr. Donaldson's customers. Mr. Mathews sent a letter to the witness complimenting him upon his success in the transaction. (340, 341.)

The statement of Mr. Clark as to the manner in which Mr. Donaldson was driven out of business at Columbus is denied by Mr. MATHEWS, supported by the affidavit of Mr. Hollingsworth. Mr. Clark bought the so-called warehouse, which was only a small shed, about 4 feet by 4, entirely on his own responsibility and without direction from any superior officer. He was reprehended afterwards for having done so. The price of \$2.50 paid was all the shed was worth. Donaldson was not driven out of business by this purchase, but rented a barn and continued thereafter. (502, 503.)

6. *Statement of policy by combination.*—Mr. ARCHBOLD testifies that he has no doubt that the Standard Oil Company, when closely pressed with competition at any point, tries to hold its trade by cutting prices, and would not declare that it had never cut prices below the cost of production, although such a case would be a rare one. Such cutting of prices is the natural law of trade. Mr. Archbold believes that ordinarily the competitors of the Standard begin the fight. He does not consider it advisable in most cases to sell goods at a loss for any purpose, but believes that if prices were cut to cost or below it the Standard Oil Company could endure the strain much longer than a smaller competitor. (568, 569, 571.)

Mr. DOBB states, in reply to a schedule of questions, that the prices of refined oil are the same throughout the United States, allowing for cost of transportation, and that they average lower, transportation considered, than in foreign countries. He stated that agents have no authority to make special cuts in special sections of the country, but has no doubt that prices have been cut to meet lower prices made by competitors. (790.)

Mr. PAGE also admits that the Standard tries to keep its trade and makes prices to do so. He presumes that during such competition prices are lower than where there is no competition, to a reasonable degree. But he adds that the Standard's policy is regularly to sell as cheaply as possible in order to increase the volume of business. (792.)

Mr. MATHEWS states that the Standard Oil Company never cuts prices first in any field, but when a competitor reduces prices it does not hesitate to meet the cut in order to hold its business. (506.)

Mr. BOYLE also states that oil refiners generally, like most other manufacturers, find themselves with surplus stocks during certain years and certain seasons, and hold out inducements to purchasers to take off the surplus at reduced prices. This is the only method, unless a combination can be formed sufficiently strong to hold back goods for higher prices. The Standard Oil Company especially aims to extend its markets in foreign countries, and to do so often sells with little or no margin of profit, especially when it has a surplus production. (This is also admitted by Mr. Archbold.) The Standard doubtless cuts prices for a similar reason in this country from time to time, just as other manufacturers do. The witness has heard that it has the further object in making such cuts of driving out competitors from particular localities, but he has never personally seen such a case, his observation being limited to the oil-producing country itself. (432, 433.)

B. *Different prices to different dealers.*—Mr. CLARK testifies that it was customary for the Standard Oil Company, at the stations where he was employed in Ohio, to make different prices to different dealers in order to hold their trade, these prices being often based on reports from local agents as to purchases of competitive oil. The witness states various instances, but especially one at Newark, where one dealer was charged 7 cents for gasoline and his next neighbor 9½ cents. In another case, Showman Brothers were charged 7½ cents for oil, Mr. Rankin 6 cents, while Mr. Hagmeier was given rebates on the nominal prices of 1 cent on gasoline and 2 on oil. (336, 339.)

These charges are denied by Mr. MATHEWS. The various tank-wagon drivers are not allowed to discriminate between one buyer and another, but must charge

all the same price for the same grade of oil. Mr. Clark could not cut the price when he was a tank-wagon driver without paying the difference out of his own pocket. A statement that at Columbus empty barrels were taken back at an exorbitant price in order to hold customers is also false.

It is nevertheless true that at times there may be some differences between different customers, owing to the existence of contracts for furnishing oil at certain prices for a period of time. It was true that at Newark, while Mr. Clark was there, there were such differences in the price of gasoline, owing to the marked advance in the general price, while some dealers remained under previous contracts. The statement specifically made that Mr. Rankin was charged 6 cents for oil and Showman Brothers 7½ cents is entirely untrue. Mr. Rankin, in fact, was charged 14 cents per gallon more than Showman Brothers, because he bought oil in barrels instead of in bulk, but an equivalent amount was refunded when the barrels were returned empty. Mr. Hagmeier was allowed a rebate of one-half cent per gallon on both oil and gasoline under a special contract, but did not receive such rebates as 1 or 2 cents. An affidavit of Mr. Hagmeier to this effect was presented, and also an affidavit stating that Mr. Clark had secured his previous statement acknowledging the receipt of rebates under a pretense that it was necessary to explain a shortage in his accounts.

The witness has never known of discriminations between different buyers under such special contracts which amounted to more than one-half cent per gallon. Such rebates are granted in consideration of an agreement that the dealer shall buy exclusively from the Standard Oil Company. Differences in prices of lubricating oil also exist under special contracts, being largely conditioned on the quantity of oil purchased and on the expense of delivering it. (494, 496, 499, 500, 505.)

C. Watching of competitors' business.—1. *Evidence of opponents of combination.*—Several witnesses testify to a practice of the Standard Oil Company of securing information as to the business of competitors, their shipments, customers, etc. It is believed by some that the employees of competitors are hired to furnish such information.

Thus Mr. WESTGATE testifies that the Standard Oil Company keeps an accurate record of every barrel of oil that the independent refiners ship to each place. The information may not be received from the local freight offices, but perhaps from junction points. The witness knows that this is the case because his customers have told him that traveling men of the Standard Oil Company have informed them that they knew of shipments coming. The traveling men report whether dealers buy Standard or independent oil and the reason. Customers of independents will then sometimes be offered oil under cost. (366, 367.)

Mr. MONNETT testifies that the Standard Oil Company frequently employs agents to follow up rival companies, ascertaining their customers, and then seeking to take them away. They drive competition out from certain places and are then enabled to charge rates sufficiently high to establish a fund for attacking competition elsewhere. (316, 318.)

Mr. MONNETT further states that testimony was given in the Ohio suits to show that clerks of competitors, for example, of Scofield, Shurmer & Teagle, of Cleveland, had been bribed to furnish information as to the amount of oil shipped, names of customers, and other details of the business of these competitors. In this case the person bribed disclosed the fact to his employer. (316.)

Mr. EMERY believes that the Standard Oil Company still receives statements from railway companies as to shipments by others, such as were agreed upon in the contract with the South Improvement Company. He states, as an example of the practice, that about a year ago he shipped two barrels of oil, along with a larger shipment, to a gentleman in Dubois, Pa. These barrels were not placed in the car until after business hours, and no one knew of their shipment. But before the oil reached Dubois the purchaser was met by an employee of the Standard Oil Company who complained of the fact that he was dealing with Mr. Emery. Other cases where information must have been given by railway officers are numerous. (614, 615, 629.)

Mr. GALL, a wholesale dealer in refined petroleum products at Montreal, testifies that the Standard Oil Company frequently sent a man to open tank cars shipped by independent refiners to the Gall-Schneider Company, to see exactly what they contained. The witness was recently able to detect a man in the act, and the explanation that it was due to a mistake is not to be believed. A representative of the Standard Oil Company at an earlier period jokingly told the witness the numbers and contents of several cars of oil which had just been received.

Mr. Gall testifies further that it is common for the Standard Oil Company to

send men to watch the delivery of oil, and then to send their own agents to the purchasers, cutting prices, and otherwise seeking to prevent competitors from securing trade. (684.)

Mr. DAVIS has been engaged in an independent refinery in Marietta, Ohio. At one time his shipping clerk was approached by an agent of the Standard Oil Company, who offered to pay him for reporting the names of persons to whom oil was shipped, the invoice, price, etc. The witness believes that every barrel of oil he shipped from his works was made known to his competitors. Their traveling men would then follow each shipment and often it would be necessary to reduce the price in order to retain the customer. In such cases the consumer probably received no benefit from the lowered prices, but only the dealer. (356, 357; as to Mr. Davis's experience, etc., p. 123, footnote.)

Mr. CLARK testifies that, while agent of the Standard Oil Company, he was required to make reports each week of the business of competitors, the customers supplied by them, the prices, etc. On the basis of these reports, the general manager at Columbus would send instructions as to methods of holding or taking away customers. Sometimes the manager would come himself and make special arrangements as to prices.

The following letter shows the practice of requiring reports as to competition:

MAY 25, 1897.

DEAR SIR: I forward to you to-day a supply of blanks, same as sample herewith inclosed, which is to take the place of the little slip that has formerly been used for reporting daily competitive oil. Will you kindly fill out one of these blanks weekly, commencing with June 1, and whenever the month ends in the middle of the week, make out one on the last day of the month for the portion of the week not covered in the last week you report? Enter upon this report all competitive oil or gasoline that you have been able to locate during the week, and if during the week you have been unable to locate any competitive shipments, then write across the face of the blank 'Nothing to report' and mail it to this office. Be sure to mail it whether you have competitive receipts to report or not. If there is anything about this report that you do not understand, please confer with me at once, as it is very important that it should be made out promptly and forwarded regularly. Trusting that I will have your hearty cooperation,

I am, yours, very truly,

B. A. MATTHEWS.

W. H. CLARK, Newark, Ohio.
(336, 339.)

2. *Reply of Standard Oil witnesses.*—Mr. ARCHBOLD declares that it is not the policy of the Standard Oil Company to obtain information from employees of its competitors, and that if through the action of some overzealous employees this were attempted it would be disapproved. The company does naturally seek information from its own agents as to the business of competitors, but none which they can not rightfully secure. (573, 574.)

Concerning the watching of the business of competing dealers, referred to by Mr. Clark, Mr. MATHEWS testifies that it is the practice of the Standard Oil Company to ask its salesmen and agents to keep their eyes open and inform the company as to those from whom different dealers are buying, and as to the general condition of business. This is required as much for the sake of ascertaining that the agents are attending to business as for any other purpose. The witness does not recall any case where anyone has been employed to follow a competitor's wagons and find out at what prices he sells. In no case has the Standard Oil Company secured reports as to the business of rivals from employees of those rivals. (505, 506.)

D. *Alleged fraud and deception by Standard.*—1. *Different grades from same tank.*—Mr. CLARK states that while he was agent of the Standard Oil Company at various places in Ohio he made it a practice, under direction of the company, to sell nominally different grades of oil at different prices from the same tanks. There are only three different grades actually handled—the Diamond White, Water White, and Ecene. As many as eight different prices are made with from one-fourth to one-half cent difference between them. Thus at Marietta prices ranged from 6 to 10½ cents. If a customer considered a certain price too high he would be offered a lower grade at a lower price, but the oil would be drawn from the same tank. At Springfield a man was hired to run a tank wagon, but resigned when directed to carry out this practice. If a customer demanded oil direct from Cleveland, barrels would be painted red and branded with a stencil sent from Cleveland. At Newark the oil was sold directly to tank-wagon men, and they learned from an

employee of the company the practice of selling different grades from the same tank. Each customer is thus satisfied and given what he wants. (331—333, 338, 341, 342.)

Mr. MATHEWS denies in detail all the allegations of Mr. Clark concerning fraudulent practices in selling nominally different grades of oil at different prices from the same tanks, and submits affidavits of W. A. Reed and C. W. Foley, agents of the Standard Oil Company, at the different places where Mr. Clark was employed, and of W. W. McMahon and C. M. Taland, tank-wagon drivers at Springfield, stating that no such practices have been at any time resorted to either by the Standard Oil Company directly, or, through its suggestions, by the tank-wagon drivers. On the contrary, specific orders were always given prohibiting such deception. The facts are that at Marietta, for example, the company has really three different grades of oil, but sells them under several different names, although at precisely the same price for oil of the same grade. Thus Water White, Red Star Water White, Silver Light, and Crystal are simply trade names for the one grade, water-white oil. They have been established by custom in different localities to meet local demands. At a few points near Marietta, Eocene, a better grade of oil, is furnished customers under the name of Hyperion, on account of the saving in freight in doing so.

Mr. Mathews also submitted affidavits of C. W. Foley and R. A. Foutz, stating that the tank-wagon driver at Springfield, who, as stated by Mr. Clark, resigned because he did not desire to deceive in the quality of oil, really resigned because he did not like tank-wagon work and for no other reason, and had so stated to the affiants.

The quality of oil does not depend on the degree shown by the fire test. The three grades sold by the Standard Oil Company all have the same fire test of 120 degrees by the Foster cup. Oils may be of exactly the same fire test but different in illuminating power, and the latter determines quality. (492-494.)

Mr. WESTGATE incidentally gives testimony which may corroborate Mr. Mathews. He states that in his refinery he manufactures five grades of oil, varying in price from 3.90 cents to 4.50 cents, at present. Special brands are sometimes put upon oil to suit different customers, but this does not imply any deception as to the quality. The witness bills his oil at the names and prices of his own brands, but affixes any name desired. (366.)

2. *Deceptive tests.*—Mr. CLARK also states that the oil sold by the Standard Oil Company in Ohio is mostly refined from Lima oil, and of inferior quality, smelling of sulphur. A German has invented a method of brushing the sulphur out of the oil. The Standard Oil Company controls this patent, but the method is exceedingly expensive. The Standard Oil Company seeks to deceive customers as to the quality of its oil by unfair tests. The witness has been directed orally by his superiors as to methods of making such tests, but has no written evidence. The deception is accomplished largely by turning the wick in the lamp high when Pennsylvania oil is being used and low when Ohio oil is being used. The oil handled by independents is mostly Pennsylvania oil and of higher quality. (345, 346.)

Mr. MATHEWS denies that the Standard Oil Company resorts to unfair tests of lamps to show the superior quality of its oil. Competitors in Ohio had been marketing oil at a reduced price containing some oil made from Ohio crude. Dealers sometimes mixed these inferior oils with oil furnished by the Standard Company, and the latter was forced to visit the customers, especially retail storekeepers, and show by actual tests the superior quality of the Standard's oil. It would have been entirely impossible to deceive by turning the flame higher in one case than in the other, as alleged by Mr. Clark. The various agents and employees of the Standard Oil Company, to whom Mr. Clark specifically refers as having knowledge of the frauds in lamp tests, all submitted affidavits denying that such frauds had been practiced and stating that similar lamps, burners, wicks, and chimneys were used in testing different kinds of oil, and that at the beginning of the test the height of the flame in each lamp was the same. (500, 502.)

3. *Adulteration of lubricating and similar oils.*—Mr. CLARK testifies that at Marietta he mixed gasoline worth 7 cents per gallon with turpentine worth 38 or 40 cents, under direction of his superior, in order to cheapen it. At Columbus, so-called boiled linseed oil was made by heating raw oil to 125 degrees and adding a small quantity of Japan drier. Miner's oil was made by mixing 2 gallons of "miner's stock," which costs about 6 or 6½ cents, with 3 gallons of cotton-seed oil. The product sells at from 22 to 34 cents. Paraffine oil was sent from Cleveland in blank barrels, and these were labeled as different qualities of machine or rubbing oil and sold at different prices without change of quality. The witness is not aware that the same methods have been used by independent refineries. (333, 334.)

Mr. MATHEWS denies in detail these charges, and submits the affidavit of Adam Paulus, mixer at Columbus, to support his evidence. The dryer used in making boiled linseed oil at Columbus was pure linseed-oil drier, which cost 10 cents per gallon more than linseed oil and increased the cost of the prepared oil, and the oil was heated to 225 degrees. The statement that miner's oil is made by compounding cotton-seed oil with 40 per cent of petroleum is false. The Ohio law, which is rigidly enforced, would absolutely prevent more than about 14 per cent of petroleum being used. The price of miner's oil is regulated by the price of cotton-seed oil, running about 2 cents per gallon below. The prices charged for miner's oil are lower than stated by Mr. Clark.

The statement that lubricating oil is received in barrels with blank heads and shipped out to meet the requirements of the trade without regard to the actual contents is untrue and absurd.

The statement that gasoline was mixed with turpentine is also false. Any buyer can detect such adulteration of turpentine instantly by the use of an ordinary hydrometer, which all druggists keep. (492, 495.)

Mr. DAVIS gives evidence tending somewhat to confirm that of Mr. Clark. He states that most refineries have a department in charge of an expert who compounds mineral oils with animal oils and makes various extractions from paraffine. There are wide differences in grade of such compounded oils, and there is much opportunity for experience and skill. It is possible for oils of practically the same quality to be sold at very different prices. The witness believes that the Argon Refining Company sold a quality of lubricating oil at 70 or 80 cents which was practically identical with that sold by his company at 22 or 23 cents. (356, 358.)

4. *Copying of brands, etc.*—Mr. WESTGATE testifies that he is manufacturing a high quality of oil known as Sunlight. The Standard Oil Company has copied this brand for sale in New York State, putting its own name on the barrels. At Fulton, N. Y., the Standard Oil Company established two retail peddlers to compete with one who had been purchasing oil from the witness. They were furnished with oil refined by the witness, and it was offered to customers, under the brand put on it by the witness, at a reduced price. This oil was probably obtained from the Merchants' Refining Company of Buffalo, to which a shipment had been made a little time before by the witness. (366, 369.)

Replying to the above statement of Mr. Westgate, Mr. ARCHBOLD testifies that on careful investigation he finds that, so far from the Standard Oil Company using Mr. Westgate's brands, the opposite is the case. The Standard had long been using yellow barrels in certain territory, and when Mr. Westgate began to do business there he used the same color, with a view to thereby furthering his trade. Mr. Archbold denies absolutely the charge of copying brands. (549, 550.)

Mr. DAVIS also testifies that the refinery in which he was interested at Marietta made special brands of oil for particular customers. It sometimes found that these names were used by other refineries, apparently for the purpose of taking away trade. At one time a shipment of oil to the Cleveland and Marietta Railroad was made, and it was later discovered that several of the barrels contained 5 or 6 gallons of water each. These had the brand of the witness's refinery, but he has the impression that they had been substituted by competitors for the purpose of injuring his trade, or else that the water had been put in by a competitor. (357, 358; see statement of Mr. Archbold as to character of witness, p. 123, footnote.)

E. Competition in foreign markets.—Mr. LEE testifies in some detail as to the conditions of competition in foreign markets, especially Germany, his evidence being confirmed by less detailed statements of Mr. WESTGATE.

Prior to 1895 the Standard Oil Company had cut prices abroad so that export oil was sold in New York below the cost of crude at the refinery. The independents had long been marketing oil in Germany through a man named Poth, but he sold out to the Standard in 1896. The Standard used unfair methods of competition, tying up all the tankage. To enable the independents to compete, the Pure Oil Company was organized, and the refineries agreed to sell it oil at cost, leaving to it the marketing of oil abroad. It erected stations at Hamburg and Rotterdam, is erecting one at Mannheim, and it has rented one at Amsterdam. It has its own tank steamers and tank cars, and is now doing a profitable business, prices in Europe being reasonable. Mr. Lee states, though he does not clearly explain the method, that the German government prevents excessive competition, because it will not allow business to be conducted at a loss. This statement is made on the basis of experience of Mr. Poth and of the agents of the Pure Oil Company. (LEE, 273-278; WESTGATE, 380, 381.)

Mr. EMEY also describes the competition of the Standard Oil Company with the independents in Germany. After the Standard had bought out Mr. Poth, Mr. Emery was sent to Germany by the independents, and immediately let a contract

for the construction of tanks in Amsterdam. In Hamburg the legislative body passed a law furnishing ground on which to build tanks. The Russians suffered equally with the Americans from the competition of the Standard Oil Company.

Mr. EMERY likewise testifies that the government of Germany in some way secures to all competitors fair conditions and prevents unfair competition, but he is not certain as to the precise method by which this is done. In 1895 he went with Mr. Poth, the agent of the independents in Germany, before the imperial ministry at Berlin to make complaint of the fact that oil was being sold on the Rhine at from 1½ to 2 cents a gallon less than on the Elbe. Mr. Emery also had a conference at St. Petersburg with the prime minister of Russia and with Mr. Nobel, the great Russian oil producer. Their views agreed with those of the independent American refiners—that they were suffering unfair competition in Germany, and that they desired to see it rectified. The independents have secured an official permission from the German government to sell oil, being required to file their American charter and being subject to a certain supervision, the precise nature of which Mr. Emery does not know. (616, 617, 623.)

Mr. ARCHBOLD declares that Mr. Lee's statements concerning governmental control of competition in Germany are "silly." (532.)

According to Mr. ARCHBOLD's testimony, below quoted under the heading "Crude oil" (p. 143), the prices of refined oil are constantly kept in substantially the same relation to those of crude, although there are sometimes variations one way or the other. In reply to a question as to whether refined oil was not sometimes sold at the seaboard at less than the price of crude, Mr. Archbold said, "I should say that is a very exceptional case. I do not recall. * * * In competing with the Russians at certain times for certain markets, we have made prices for refined that were as low as the crude product * * * but they have been very exceptional cases, and it is not the case to-day." These cuts have been made especially in the far east, and the company has relied on the profits from by-products to offset them. (571, 572; see also BOYLE, 433.)

V. OUTPUT AND PRICES OF REFINED OIL, PROFITS, COST OF REFINING, ETC.

A. Monopolistic character of the Standard Oil Company.—1. *Generally.*—There is a general consensus among the opponents of the Standard Oil combination that it has a sufficient control of the markets for refined oil to practically constitute a monopoly. The business of independent refiners is confined to a few sections of the country, and the larger proportion of their oil is sold abroad. It was testified that the Standard Oil Company now controls from 90 to 95 per cent of the business of refining. Mr. Lockwood declared that the independent refiners, including the Ohio field, handle about 4 per cent of the oil product. (LEE, 272, 286; LOCKWOOD, 401.)

Mr. PHILLIPS declares that, although the Standard Oil Company has no legal advantages under the laws incorporating it, it has practically been able to monopolize the oil business. Controlling at least 80 per cent of the business of refining, it is able largely to fix prices. The witness believes that but for the Standard the public would have been better served, at lower prices. (596, 600.)

Mr. ARCHBOLD submitted, in reply to the evidence of Mr. Lockwood and others, the following statement showing the amount and proportion of oil refined in the United States by the Standard Oil Company and by other refiners during the years 1894 to 1898, inclusive. (560.)

Year.	Standard Oil Co.		Others.		Total.
	Barrels.	Per cent of total.	Barrels.	Per cent of total.	Barrels.
1894.....	18, 113, 933	81.4	4, 145, 232	18.6	22, 269, 165
1895.....	18, 248, 051	81.5	4, 084, 720	18.2	22, 332, 771
1896.....	18, 341, 161	82.1	3, 509, 719	17.9	21, 850, 880
1897.....	18, 141, 479	82.4	3, 876, 706	17.6	22, 018, 185
1898.....	19, 999, 939	83.7	3, 914, 999	16.3	23, 914, 938
Total.....	90, 949, 563	82.3	19, 591, 376	17.7	110, 540, 939

2. Competing refineries.—Mr. DAVIS testifies that there are about 12 or 15 independent refineries in Pennsylvania. They are not formally combined, but have common interests in pipe lines. They refine about one-tenth of the oil. (380, 381.)

Mr. LEE and Mr. EMERY testify that the various independent refiners are not at all directly connected with one another, although each owns stock in the various independent pipe lines and in the Pure Oil Company, which markets a part of their production abroad. It has been proposed to combine the refineries completely. The Producers and Refiners Pipe Line sells oil to the independent refiners, the United States Pipe Line conveys their oil to the seaboard, and the Pure Oil Company buys oil from them. Any dividends of these companies go to the refiners as far as they are stockholders. The separate refiners market their own oil to a considerable extent. Some of them have stations and special agents, but most sell to ordinary merchants.

Mr. EMERY adds that the various independent refiners compete actively with one another, both in the domestic and in the foreign trade. Although part of the export oil is sold through the Pure Oil Company, the refiners also sell separately in almost every European country. (Lee, 290, 291; Emery, 656, 657.)

Mr. MONNETT testifies that the Standard Oil Company has practically no opposition in Ohio from competing pipe lines or refineries. He believes that Scofield, Shurmer, and Teagle have some arrangement by which they are allowed to survive. Other apparently competing companies are under the control of the Standard Oil Company in one way or another. (318, 325, 326.)

Replying to this testimony (on the hypothesis that Mr. Monnett includes in his statement the production of crude petroleum, as well as its transportation and refining), Mr. ARCHBOLD testifies that in the Lima district alone there are more than 1,600 companies, partnerships, and individuals engaged in producing oil, in which the Standard Oil Company has absolutely no interest whatever. There are 8 large active concerns refining oil, which the witness names, besides several smaller concerns. These companies during 5 years, from 1894 to 1898, have done a business of 14,647,949 barrels. (543-546.)

Mr. LEE refers to the list of independent refineries published in the report of the Committee on Manufactures in 1888. Of these he is aware that the following have been absorbed by the Standard Oil Company: New York, Borne, Scrymser & Co., Lombard, Ayers & Co.; Pittsburg, Bear Creek Refining Company, Globe Refining Company; Oil City, Keystone (torn down); Franklin, most of the refineries shut down; Bradford, no refineries now in existence; Parkersburg, one absorbed by the Standard; Titusville, Schwartz's, National, and Western refineries combined into Union Refining Company, absorbed by Standard and torn down, also International Works torn down; Philadelphia, Bosshart & Wilson. The Standard Oil Company has also leased a number of refineries at high rates and then shut them down, thus paying a bonus for idleness. The purpose is to check competition. (270-272.)

Mr. DAVIS was largely interested in a small refinery at Marietta, Ohio. It handled chiefly Macksburg oil, which is rich in paraffine and lubricants. These had been sold in considerable amounts to the Baltimore and Ohio Southwestern Railroad, but its managers became interested in the Argan Refining Company, at Marietta, and the withdrawal of its patronage, together with discriminations in rates, which the witness believes to have existed, led largely to the closing of his refinery. A further difficulty was that the Buckeye Pipe Line Company charged 35 cents per barrel for piping oil from wells owned by the witness and his associates in the Corning field, 40 miles distant. The railways also charged a similar rate for hauling crude oil from the field to the refinery.¹ (351-353.)

3. *Colorado refineries.*—In evidence before the subcommittee on mining in Colorado, it was brought out that the refineries handling the product of the oil field in that State are forced to sell all their output to a distributing company, which is only a branch of the Standard combination. Mr. ARCHBOLD, when questioned on this subject, stated that there was certainly no compulsion, as had been charged, upon the refiners to sell to the Standard. He declared that he was not familiar with the subject, but the act must be voluntary. Mr. BOYLE also stated that he was not familiar with the situation in Colorado, although he has understood that the Standard does not itself refine the product of that field, but buys the output of the other refineries. (Boyle, 384; Archbold, 379.)

4. *Control by Standard in Canada.*—Mr. GALL, who is a wholesale oil dealer at Montreal, testifies that the total amount of refined oil products manufactured in

¹ Mr. ARCHBOLD testifies that Mr. Davis has had practically no experience in refining oil. He has an interest in a "little alleged refinery at Marietta." He sought to sell this property to the Standard Oil Company, which declined to buy on the ground that it was of no value to it. After his appearance before the Industrial Commission Mr. Davis again offered to sell the property to the Standard Oil Company. Mr. Archbold submitted a letter from him regarding this proposition, dated July 13, 1899, together with the reply of Mr. Archbold declining to purchase the property. (546.)

Canada in 1898 was 21,153,192 gallons, of a value of \$1,723,293. The Standard Oil Company in July or August, 1898, secured complete control of all the refineries in Canada, of which there were 5 then in operation and 4 temporarily closed. All of these except the former Imperial Oil Company plant and one at Sarnia have been dismantled. Mr. Gall believes it possible, however, that these existing refineries have almost as great capacity as the old ones, and sufficient to refine the entire Canadian production of crude oil. In fact, owing to the tariff of 5 cents per gallon on the importation of oil, it is much cheaper for the Standard to refine oil in Canada. (673.)

Mr. GALL testifies further that his company formerly handled largely Canadian oil, but that since the Standard Oil Company secured control of the refineries there it has been impossible for his company or any other organization to obtain oil from the Standard Oil Company except by promising to buy exclusively from it. The Standard Oil Company has 2 or 3 times sent men to the Gall-Schneider Company making such a proposition for exclusive patronage of the Standard. (677, 678.)

Mr. ARCHBOLD testifies that the condition of the refining business in Canada has been very much disorganized; that the Standard Oil Company has comparatively recently entered the field, and that it now is doing, he thinks, about 75 per cent of the refining in Canada. (572, 575.)

5. *Purchase of refineries by Standard Oil Company.*—Mr. LEE, Mr. WESTGATE, and Mr. EMERY all testify concerning the recent attempts of the Standard Oil Company to buy out competing refineries. One main purpose in this attempt is to secure the stock held by those refineries in the United States Pipe Line and the other independent pipe-line organizations. Quite high prices have often been offered for these properties, but in most cases the owners have declined to sell, largely as a matter of sentiment, even though they expected to be driven into bankruptcy from long-continued losses through the competition of the Standard Oil Company. Offers have been made, Mr. Lee believes, to all of the independent refineries.

Three large independent refineries in the oil regions have been bought out since 1895 by the Standard Oil Company and have been dismantled. One of these belonged to Mr. Ramage, another was the National Refining Company, and the third the Continental Refining Company. All of these were first class and modern, but they have been entirely dismantled. To destroy them thus was a waste of capital which it had taken years to build, and the purpose of the Standard Oil Company was undoubtedly to destroy their competition as well as to injure the independent pipe lines. All of these refineries had contracts to take oil from these pipe lines, and the withdrawal of their patronage has involved a serious loss, since it costs little more to handle a larger quantity of oil through the pipe lines. The Standard declined to sell any of the material of the dismantled plants to other independent refineries. (Lee, 288, 290; Westgate, 370, 371; Emery, 657.)

Mr. ARCHBOLD admits that the Standard Oil Company has frequently purchased and dismantled plants of its competitors:

"We have at times bought refineries with the expectation of succeeding to the volume of business done by them. We have universally replaced the capacity of these refineries by better ones and better-equipped construction at more favorable points. We would not buy refineries and dismantle them for the pleasure of doing it."

"Q. Incidentally, in connection with that, it might be a more convenient way of holding your market in a locality where competition would figure?—A. Precisely."

Mr. Archbold testifies further that the purchase of refineries in Titusville was no exception to the above statement. The Standard Oil Company utilized the property of one of these refineries in establishing a plant in Puerto Rico and of another in establishing one in Kansas. There is at all times an excess of capacity in the refineries of the country, and the sole purpose in abandoning any plant is to conduct the business at a point where it can be more economically done. (572.)

Mr. DAVIS states that the Argan Refining Company, at Marietta, was recently leased to one of the branches of the Standard Oil Company at 6 per cent on \$200,000 for 10 years. The owners have since practically sold out to the same parties, this apparently being due to the suit brought against them for joining the trust. The witness believes that he could put up as good a plant for \$75,000, but he does not think that the Standard Oil Company often pays high prices for competing plants. He believes that Scofield, Shurmer & Teagle are making profits. (351-353, 361, 362.)

6. *Control of competition by pipe lines.*—Several witnesses testify, directly or by implication, that one of the chief means by which the Standard Oil Company

has been enabled to drive out competitors has been its control of the pipe lines for handling crude oil. Compare on this subject the testimony under the headings: Pipe Lines (pp. 105, 106); Railway Discriminations (pp. 152-155.)

Mr. DAVIS, who is interested in wells in the new Corning field near Marietta and in a refinery at Marietta, testifies that the price of the Corning oil is fixed by the pipe line at 17 cents less than Macksburg oil, although it is in some ways of as good quality. The witness desired to pipe oil from his wells to the refinery at Marietta, but was charged 35 cents per barrel pipage, the ordinary rate throughout the oil fields being 20 cents. Practically he was forced to sell oil at the Corning field to the pipe-line company and to buy from it oil of about the same quality at 17 cents more. This was one means used by the Standard Oil Company, apparently, to drive his refinery out of business (352, 353.)

7. *The Matthews case.*—Mr. LOCKWOOD refers to the case of Mr. Matthews, of Buffalo, and the alleged conspiracy of the Standard Oil Company to blow up his refinery, but does not state the facts in detail. He refers to the fact that Matthews's partner, who had been bribed to betray him, was kept under cover for 4 years, with an assumed name, but finally confessed to Matthews. Matthews secured verdicts for \$270,000 against the Standard Oil Company in civil damage suits, but his creditors, under the receivership to which he was forced to submit, had to settle for \$17,000. (389.)

Mr. ARCHBOLD submits a detailed statement of the facts concerning the case referred to by Mr. Lockwood. In 1881 Matthews and two others were confidential employees of the Vacuum Oil Company, whose chief officers were H. B. and C. M. Everest. The Standard Oil Company was interested in the stock of this company, but had no control of its affairs. Matthews and his associates conspired to leave the employ of the Vacuum Oil Company and to establish a small business in Buffalo, taking advantage of their knowledge of the processes and patrons of the Vacuum Oil Company, and expecting that that company would be forced to buy them out. The Vacuum Company brought suit for infringement of its patents. At this time one Miller, who had left with Matthews, was reemployed, at his own solicitation, by the Vacuum Company. Later, however, he again left this company, went over to Matthews, and through his statements an indictment was brought by the grand jury against all the directors of that company, charging it with conspiracy against the Buffalo concern. The balance of evidence in the case was overwhelmingly in favor of the Vacuum Company. The judge held that there was not any evidence against the directors belonging to the Standard Oil Company and directed the jury to acquit them, but Messrs. Everest were held guilty by the jury, plainly under the influence of the plea of the district attorney. Mr. Archbold declares that all the charges concerning the attempted blowing up of the Buffalo works are the purest fiction, and submits a copy of an affidavit signed during 1888 by 6 of the jurors in the case, stating that it was not their intention individually, nor, as they believe, the intention of the jury as a body, to hold the defendant guilty of conspiracy to destroy the Buffalo works, but that the conviction was based on the enticement of Miller from the employ of that company. These jurors also recommended that the punishment be limited to fine without imprisonment. A note is appended to the signature of one of the six, saying that he swore to the recommendation only.

The statement that Matthews secured civil verdicts for \$270,000 is untrue. He brought a suit for \$30,000, and the judge set aside the verdict of the jury granting that amount as excessive. He later brought suit for \$250,000, which was never brought to trial. Mr. Archbold does not know concerning any settlement that may have been made of this suit out of the courts. (554-556.)

B. *Effect of combination on prices.*—1. *General statistics.*—All the witnesses testifying in opposition to the Standard Oil combination express the opinion that it has not reduced the price of refined oil as compared with crude oil to any such degree as would be the case under open competition. They especially argue that care must be exercised against the fallacy of failing to distinguish between the reduction of the price itself, which depends largely on the price of crude oil, and that of the margin between refined and crude. The reduction of this margin is generally admitted, but it is declared to be by no means commensurate with the improvements in the processes of refining. The greatly improved uses of by-products are especially pointed out as having made possible a much greater reduction in prices.

On this point of the effect of combination on prices, reference should be made to the table showing the prices of crude and refined oils on pages 137 and 138 (noting that about 2½ cents per gallon is to be subtracted from the price of refined oil as representing the value of the barrel). A clear view is obtained by consulting the diagram in the Introduction.

It is to be observed especially that the prices of refined oil given in the tables ordinarily quoted are the export prices at New York. Export oil is of a somewhat lower grade than the water-white oil used in this country.

According to Mr. BOYLE's testimony there are no satisfactory records showing the price of water-white oil in this country. The price varies from place to place according to the cost of transportation, special contracts, etc. The witness believes that if it were possible to find some one standard market in this country where a record has been kept of the prices of a standard grade, such as water-white oil, from year to year, these figures would give a fair basis for judging the influence of the Standard Oil Company upon American consumers. Cincinnati was suggested as a point where such records had been to some extent maintained. (447, 448.)

2. *Statements of opponents of combination.*—In addition to the general opinions, above-referred to, as to the effect of the Standard combination on prices, specific statements were made as follows:

Mr. LEE believes that the cost of refining has fallen during the past 20 or 25 years from 2½ cents to one-half cent per gallon, while the margin of difference between crude and refined has fallen little. The prices for refined oil fixed by the Standard are not based on the cost of refining or of crude oil, but are entirely arbitrary. To a considerable extent, probably, it sells oil ahead and afterwards puts up the price of crude, so that its competitors will not be able to meet its prices for refined. (275, 276.)

Mr. RICE declares the claim that the Standard Oil Company has reduced the price of refined oil to be absurd. Mr. Thurber's comments on this point (p. 129) pay practically no attention to the influence of the price of crude oil upon refined. There was a reduction in the price of refined oil from 6½ cents in 1861 to 2½ cents in 1870, before the Standard Oil Company came into existence. Mr. Rice also dwells upon the great difference between the price of export oil and that which domestic consumers have to pay. During the severe competition in foreign markets in 1896 the price of refined oil to retail dealers in New York was 9½ cents per gallon, and that of export oil 4½ cents per gallon. In 1892 oil was selling in Texas, Utah, Idaho, and other Western States at four times the export price, and in many nearer States, such as Missouri and South Carolina, at double the export price. (733, 734.)

Mr. PAGE declares that it is unfair for Mr. Rice to compare the export prices of oil, which are prices practically at the mouth of the refinery, with those at distant points, where the freight rates and expenses of distribution are high. He says that it is the general policy of the Standard to reduce the cost of refining in every way and to sell as cheaply as possible, with a view to increasing the demand of the consumers by lower prices. (791.)

Mr. WESTGATE testifies that the reductions in the price of refined oil are not due simply to the advantages of the Standard Oil Company in production. In the early days the by-products—benzine, gasoline, tar, etc.—were entirely worthless. They constitute about 20 per cent of the crude product and are now worth about as much as refined oil. The quotations of prices ordinarily given are those in barrels at the seaboard. The barrels were formerly worth \$2 or \$3, now 88 cents, which makes a difference of about 2 or 4 cents per gallon in the price of oil. The export price, moreover, gives no information as to the average prices received in this country. When a cut is made in the export oil it may easily be offset by increasing prices of domestic oil. Nevertheless, the witness believes that the Standard Oil Company employs the best brains in manufacturing oil and has brought forward many improvements and inventions. But if the company now possesses any superior methods, the independent refiners do not know it. The independents can produce as good goods, and as economically, the witness believes, as the Standard Oil Company. (371, 372.)

Mr. EMERY believes that the people generally would get oil at 50 per cent less than at present if there were active competition over the entire country. In another place he estimates that European consumers get their oil, quality considered, 25 per cent cheaper than the average American consumer.

The witness has bought refined oil in California in cans at 20 cents per gallon, of precisely the same quality that he was selling at his factory in Pennsylvania for 4½ cents. Similarly he has bought gasoline at 25 cents per gallon of a kind which he was selling at 4 cents. The freight, according to open rates, from Pennsylvania to the Pacific coast is about 6½ cents per gallon, allowing for leakage and other losses, so that oil might be sold there at from 10 to 12 cents per gallon. The witness does not know what proportion of the prices charged was the retail dealer's profit. (629, 632, 633.)

Mr. MONNETT admits that the Standard Oil Company has taken advantage of various improvements in production and transportation—pipe lines, tank cars, development of by-products, etc.—but declares that it can no more claim to have reduced prices by its own efforts than to have reduced the price of calico from 75 cents to 4½ cents per yard. It has been profiting by many millions through non-competitive prices, notwithstanding such general decrease in price. (317, 318, 323.)

3. *Canada*.—Mr. GALL submitted a statement of the prices which he paid for refined oil at St. Johns, Quebec, before and after the Standard Oil Company secured control of the refineries of Canada (August, 1898). The price, delivered, ranged from 11 to 14½ cents between September, 1892, and June, 1899. At the latter date it was 13½. Since then the Standard Oil Company has raised the price to 17½ cents. The price of crude oil in Canada has not risen with such rapidity as in the United States. During 1898 it stood at \$1.40 per barrel, and in June, 1899, at \$1.45. It has since been raised to \$1.60, but this represents an increase of only one-half cent per gallon during a time when refined has been raised 4 cents. The increase in the price of crude has been made with a view to encouraging production, since it is cheaper for the Standard to refine Canadian oil, on account of the tariff on importation. (674, 679.)

Mr. GALL attributes the high prices of oil in Canada largely to the tariff on refined oil, which is now 5 cents per gallon, having been reduced somewhat by the last Conservative government in 1896. The present Liberal government has promised to remove the tariff altogether, but has so far failed to do so. The tariff is excessively high. The cost of Ohio oil at Toledo ranges from 3 to 5 cents, so that the tariff is fully 100 per cent. The rates on other commodities under the Canadian tariff are from 10 to 50 per cent. The only remedy for the monopoly of the Standard Oil Company and the maintenance of excessive prices is the removal of this duty.

Owing to the likelihood of the removal of the Canadian tariff on oil, it is considered a very risky investment to establish a refinery there now, since without the duty it would be entirely unprofitable. Nevertheless, the Standard Oil Company has made enough profit from the Canadian business to cover the cost of the refineries it purchased. (680-682.)

4. *General reply of Standard's defenders*.—Replying to the above testimony that the Standard Oil Company has not lowered prices to consumers, Mr. ARCHBOLD referred to the table showing the comparative prices of crude and refined oil since 1870 as proving the contrary (pp. 137, 138). He also submitted the following tables showing the average prices of oils in New York, Chicago, and Cincinnati as proving the same point. (634-548.)

Average prices received for deliveries of standard white illuminating oils at New York City, Chicago, Ill., and Cincinnati, Ohio, during years 1885 to 1899, inclusive.

[Prices given are cents per gallon in bulk, exclusive of the package; 2½ cents per gallon added will give average price, including barrel.]

To the statement that were it not for the existence of the Standard Oil Company consumers would get oil at a much lower price Mr. ARCHBOLD replies that it would evidently tend to increase prices if two-thirds or three-fourths of the active capital and equipment engaged in refining should be withdrawn, and also that the opponents of the Standard are inconsistent in testifying that at existing prices the independents can not make a fair profit. If it is true, as claimed by Mr. Lee, that the Standard makes \$1.50 to \$2 on every barrel of oil, while the independents would be satisfied with 10 cents, the independents are not now efficient servants of the public. (531, 532.)

In reply to Mr. Lee's statement that if there were 50 concerns engaged in manufacturing petroleum just as wide markets would be obtained throughout the world as at present, while consumers would secure as low prices and all refiners would make a fair profit, Mr. ARCHBOLD submitted a list of 66 refineries now existing independent of the Standard Oil Company, the average duration of operation of which has been 14 years. (540-542.)

Mr. ARCHBOLD further expresses the opinion that the Standard Oil Company, notwithstanding the fact that it controls more than 80 per cent of the refined-oil production in this country, is unable permanently to exact excessive prices. He admits that it might temporarily have such power, but declares that if it exercised the power injuriously or arbitrarily the combination would lose business and perhaps provoke heavier competition. He hopes, and on the whole believes, that the Standard Oil Company is able to get prices higher than it could do under severe competition, admitting that there is a certain amount of monopolistic power coming from the aggregation of capital itself, but he adds that this monopolistic power is very slight at present. The lessened cost of doing business on a large scale more than compensates to the consumer, in Mr. Archbold's opinion, for the monopolistic power of getting higher prices. Part of Mr. Archbold's testimony in detail is quoted below:

"Q. Now, the general result, then, is this: By virtue of your greater power you are enabled to secure prices that on the whole could be considered steadily somewhat above competitive rates?—A. Well, I hope so. I think we have better merchandizing facilities, better marketing facilities, better distributing facilities, and better talent than a competitor can have.

"Q. I am not asking with reference to your power of making profits, but it is with reference to getting the prices from the consumer.—A. Prices are what make the profit. If we had a better average price, we could get a better profit.

"Q. You think, generally speaking, that you get prices for oil slightly above competitive prices?—A. Well, I should think so; I could not answer—that is a very general question and very difficult to answer. I could not answer that specifically. I hope that we do.

"Q. Of course, in this investigation we are seeing if we can get some general principles on which legislation might be based, and these questions are to bring out, if we can, the power that so great an organization has in fixing prices. Would you say; then, that in the case of an organization that controls perhaps 80 per cent of the markets of the country there is a monopolistic element that enters in which enables them to hold prices above the regular rate? Is there a monopolistic power that comes merely from the power of capital itself?—A. Undoubtedly, there is an ability, and when that ability, as I have said, is unwisely used, it is sure to bring its own defeat.

"Q. If that ability goes to get an exorbitant price, of course it will invite competition, but when that ability is kept within modest limits, would you still say that it was in the power of such an organization to get the benefit of the monopolistic power that comes merely from the power of capital itself?—A. Well, I should say that that would be a very restricted power, a very restricted limit. The competitors in this country are very active.

"Q. What?—A. The competitors are very active; they are alert at all points with their small offerings in the hope to find just such a condition as you describe.

"Q. Certainly.—A. But, as I say, as business is and as it has been for many years, we could not have that ability to any considerable extent as merchants.

"Q. If the ability were operative only to a slight extent, would it still be enough, do you think, to make a difference between what we may call a moderate dividend, say 6 or 7 per cent, and a pretty high dividend of between 15 and 20 per cent?—A. Well, that involves so nice a question that I could hardly undertake to answer it; but generally, as to the effect on the community, I should say—

"Q. Generally on the prices in the United States?—A. I should say that the lessened cost incident to doing business in a large volume would more than compensate the consumer for any ability in getting higher prices.

"Q. Then, that leads to this point, whether the large capital does itself give an organization the power to get a somewhat higher price than it could in the market provided the competitors were substantially equal in power?—A. Oh, it may be so; but that is a difficult question to answer." (509, 570.)

Mr. THURBER expresses the belief that the reduction in the price of refined oil was from 25.7 cents in 1871 to 5.7 cents in 1898. This is attributable partly to increased production of crude oil, but more largely to improvements in manufacture and transportation attainable only through aggregation of capital. (4.)

Mr. BOYLE believes that the Standard Oil Company has been beneficial to the producers as a whole and to the public generally. The producers now are prosperous and satisfied with the prices they are obtaining. Without the organization of the Standard Oil Company the business could never have been developed as fully as it has been, through the superior organizing and marketing ability of the combination. (488-490.)

C. Cost and profits of refining—By-products (see also DIVIDENDS, p. 99; ECONOMIES, p. 130).—Closely connected with the subject of prices is the cost of refining and the rate of profit. Opponents of the combination believe that it makes excessive profits on each barrel of oil refined, and confirm this by pointing to the high dividends and the great value of the stock of the Standard Oil Company.

Thus Mr. LEE testifies that with refined oil selling at 9½ cents in New York, as it did in 1896, the Standard Oil Company should have received a profit of nearly 100 per cent above the cost of refining. The witness believes that the Standard now makes from \$1.50 to \$3 on every barrel of oil. The difference in price between crude and refined oil during the past 20 years has decreased only slightly, while the cost of refining has fallen from 2½ cents to less than one-half cent a gallon, so that profits have greatly increased. (269, 273, 275, 276.)

Mr. PHILLIPS estimates that the Standard Oil Company has made an average profit of \$1 per barrel on all oil produced during its existence. He declares that its existing plants have practically been paid for entirely out of its profits. The value of its stock is nearly \$500,000,000, and the number of barrels of oil produced during the past 17 years is about 500,000,000, these figures representing to the Standard a profit of about \$1 per barrel. The average price of crude oil itself has been only about 90 cents. Mr. Phillips, like Mr. Lee, declares that the independent refiners would be satisfied with a profit of 10 cents per barrel, which is more than they

earn now. He admits that the higher profits of the Standard are partly due to superior utilization of by-products. (590, 591, 602.)

Detailed estimates as to the cost of refining and the margin of profit were not presented in evidence. Several witnesses pointed out that the by-products of refining, which are of great value, must be considered, and that they complicate the calculation. (See p. 132.)

Mr. WESTGATE, an independent refiner, testifies, broadly, that the cost of refining oil is about one-half cent per gallon, but adds that where crude oil is 3 cents and refined oil is sold at 4 it does not follow that the clear profit is one-half cent. There is a loss of quantity of from 5 to 7 per cent in refining, and some by-products of lower grade are sometimes worth as much as refined oil, but sometimes less (368.)

Mr. MONNETT states that it has been brought out repeatedly in the Ohio suits and trust investigations that refined oil could be delivered in Ohio at a cost of 4 cents a gallon or even lower. (315, 316.)

Mr. RICE declares that from 1871 to 1880 the cost of refining oil did not exceed 1 cent per gallon, from 1880 to 1890 one-half cent, and since 1890 one-fourth cent, although to the average independent refiner the cost has been about one-eighth cent higher than this. He states further that during the past 10 years oil could have been sold in this country, on the average, at 2½ cents per gallon. He calculates that the market price of crude oil has averaged only 1½ cents per gallon; that the cost of local pipage and pipage to the seaboard has not exceeded one-eighth cent each, while he adds one-fourth cent for the cost of refining, and one-half cent as the average rate of freight paid by the Standard Oil combination to interior places. The Standard makes a still higher profit on oil refined from Ohio crude, which costs very much less per barrel. (735.)

Mr. DAVIS states that the cost of fuel and some of the chemicals used in refining has been considerably less during the past 3 or 4 years than before. The independents themselves buy their sulphuric acid chiefly from the Standard Oil Company, which furnishes it cheaper than other dealers. Twenty years ago the by-products, benzine, tar, etc., were largely thrown away, but they are now often worth more than the refined oil. (358, 360.)

Mr. ARCHBOLD testifies that the improved methods of utilizing by-products in recent years have greatly increased their sale, and that they substantially equal in value the refined oil itself. On its being pointed out that notwithstanding the increased profits from this source the margin of price between refined oil and crude oil had not been materially decreased during a number of years, Mr. Archbold states that there is a point below which it is not possible to reduce prices, and that, in his opinion, the profits of the Standard Oil Company have not increased during the past 6 years. He also states that in calculating the profits of refining illuminating oil is not considered by itself, but the value of all products jointly is taken, the price of each being fixed according to demand. (570, 571.)

VI. ECONOMIES OF COMBINATION AND CONSEQUENT ADVANTAGES.

(See also PRICES, p. 125)

A. Generally.—Mr. ARCHBOLD declares that large corporations are necessary, especially in view of rapidly growing foreign commerce, and maintains that the Standard Oil Company has done very much to develop foreign trade in petroleum. It has also been beneficial to the consumers generally in furnishing them goods of vastly improved quality at greatly reduced prices, and in distributing oil to the most remote sections of the country promptly and cheaply. During the early years of the petroleum industry the methods of production, manufacture, and transportation were very crude and the average quality of oil unsatisfactory. The Standard Oil Company brought to the business ample capital, employed the best possible talent in all branches, used the most progressive methods and the most perfectly equipped and favorably located refineries, and inaugurated new systems of transportation. One of the chief advantages of combination is that the best formulas and processes can be employed in every one of the separate establishments. (562-564, 580.)

Mr. JOHN D. ROCKEFELLER, in an affidavit, replying to interrogatories from the commission, states: "I ascribe the success of the Standard to its consistent policy to make the volume of its business large through the merits and cheapness of its products. It has spared no expense in finding, securing, and utilizing the best and cheapest methods of manufacture. It has sought for the best superintendents

and workmen and paid the best wages. It has not hesitated to sacrifice old machinery and old plants for new and better ones. It has placed its manufacturing plants at the points where they could supply markets at the least expense. It has not only sought markets for its principal products, but for all possible by-products, sparing no expense in introducing them to the public. It has not hesitated to invest millions of dollars in methods for cheapening the gathering and distribution of oils by pipe lines, special cars, tank steamers, and tank wagons. It has erected tank stations at every important railroad station to cheapen the storage and delivery of its products. It has spared no expense in forcing its products into the markets of the world among people civilized and uncivilized. It has had faith in American oil, and has brought together millions of money for the purpose of making it what it is, and holding its markets against the competition of Russia and all the many countries which are producers of oil and competitors against American oil." (796.)

Mr. BOYLE believes that the success of the Standard Oil Company proves that it was the fittest to survive, and that its methods have been most skillful. There was nothing 20 years ago to prevent other organizations from being formed to control pipe lines and to develop the oil business, but they failed to do so. The Standard then invested \$3,000,000 in one pipe line, incurring what was considered a very great risk. Its officers had the courage, energy, and ability to strike out where others feared to enter. But the pipe-line system has been only one factor in the success of the Standard. Its greatest superiority has been in its ability to market its products, in its organizing mercantile capacity. Mr. Boyle does not consider that the Standard Oil Company is especially superior in its methods of manufacturing. Neither the Standard Oil Company nor the independents have the monopoly of inventive genius. The Standard, however, is entitled to more credit than it has received for its achievements in refining Lima oil satisfactorily.

The witness believes that the ability of the Standard Oil Company has had a great influence in making the oil business as extensive and prosperous as it is to-day. Without this organization the business would be carried on on a much smaller scale. (486, 488-490.)

B. Transportation, and location of refineries.—Mr. DODD, solicitor of the Standard Oil Company, in his statement summarizes the advantages of the methods of the Standard in regard to transportation as follows:

"1. They have cheapened transportation, both local and to the seaboard, by perfecting and extending the pipe-line system; by constructing and supplying cars by which oil is shipped in bulk; by building tanks for storage of oil in bulk; by purchasing and perfecting terminal facilities for receiving, handling, and reshipping oils; by purchasing and building steamers and lighters for river and harbor service; by building wharves, docks, and warehouses for foreign shipments; by purchasing and building ocean steamers for carrying oil in bulk, and by employing in foreign countries the same special methods for storing and transporting oils in bulk, by which means alone the markets of Europe are to-day held for American oil against Russian competition." (799.)

Mr. ROCKEFELLER and other witnesses emphasize the economy of the pipe-line system, and the need of large capital to make it successful. (See pp. 101, 105.)

Mr. DODD states that some of the refineries which entered the Standard Oil Trust were abandoned because of unsatisfactory location or ill adaptation for the desired work, being replaced by others at more convenient locations, and superior plants. In fact, during the past 18 years all the plants of the combination have been practically made over and rendered more effective. (798; see also, as to dismantling of refineries," p. 124.)

Mr. PAGE urges with special emphasis that the Standard Oil Company has considerable advantage over its competitors in the cost of transporting oil by rail, owing to the fact that it has many refineries in different places and can supply the consumer from the nearest point, while the owner of a single refinery has to ship much longer distances. The point is made in reply to charges that the Standard secures lower freight rates than its competitors, and is more fully summarized under the heading "Railway discriminations" (p. 161.)

Mr. LEE believes that oil can be refined cheaper in the interior than on the seaboard. Land, labor, and fuel are all cheaper and water is abundant. (268.)

Mr. EMERY testifies that the Standard Oil Company has in recent years been inclined to rebuild refineries in Pennsylvania, and to do a relatively small proportion of its business near New York and elsewhere on the coast. Fuel is cheaper in Pennsylvania and it is in every way the proper place for refining oil. The Standard Oil Company has spent millions in new plants in Philadelphia and also in the oil districts. (649, 650.)

C. Processes.—Mr. DODD summarizes the advantages of combination in regard to the processes, etc., as follows:

"By uniting the capital, skill, and acts, and the various processes and patents of a number of persons, as well as their secret processes and by building up manufacturing on a more extensive and perfect scale, with improved machinery and appliances, and by locating them in the centers of the trade they were intended to reach, the manufacture of oil has been much cheapened and improved.

"By spending large sums in the investigation of methods of utilizing Ohio and Indiana oils, and by purchase of various patents, they have succeeded in making a superior article of illuminating oil out of what for some years seemed an almost worthless product.

"By uniting with the business of transporting and refining businesses necessarily collateral thereto, to wit, the manufacture of barrels, tin cans, boxes for inclosing cans, paints, glue, sulphuric acid, etc., and by union of capital and skill, obtaining the best machinery and manufacturing on a large scale, they have cheapened these products."

Mr. DODD enumerates the patents held by the Standard Oil Company in 1883, on machinery and processes. Most of these have to do with the manufacture of cans, boxes, and barrels. There is one patent upon stills for refining and distilling oils, one on an apparatus for separating petroleum products, and several upon the manufacture of lubricating and hydrocarbon oils, paraffine, and vaseline. (798.)

Mr. LEE believes that the Standard Oil Company has no appreciable superior processes or economies in production. There may be some slight difference in favor of large refineries, but one with a capital of \$500,000 would be able to secure every by-product at the lowest possible cost. The independents produce oil as cheaply as the Standard, and of better quality. The making of tin cans and barrels can also be done as cheaply by other manufacturers. (268, 269, 278.)

Mr. EMERY declares that the Standard Oil Company has not improved the methods of refining especially, but that, on the contrary, if the business had been entirely open to competition, there would have been more rapid development than has taken place. As early as 1872 the company with which the witness was connected was employing every device which is now used for making illuminating oil. The process of distillation, in fact, is not difficult, and is practically the same now as in 1860, cylinder stills being used both then and now. (624.)

Mr. WESTGATE does not consider competition against the Standard Oil Company impossible so long as fair conditions prevail. Mere aggregation of capital is not the difficulty. The advantages in the matter of transportation and the cutting of prices below the cost of production are the causes of the Standard's ability to drive out competitors. These evils should be checked by law. (382, 383.)

D. By-products.—Considerable testimony was adduced as to the superior advantages of the large capital of the combination in manufacturing and marketing the by-products of petroleum. This advantage was quite generally admitted by the opponents of the Standard.

Mr. ARCHBOLD testifies that there has been a decided increase in the value of by-products in the refining of oil during the past 10 or 15 years. The leading products are gasoline, naphtha, paraffine, lubricating oils, and vaseline products. He does not consider that a refinery with a capitalization of only \$500,000 could secure these by-products in anything like as economical a manner as the Standard Oil Company does with its great specialization of methods. The by-products are now substantially equal in value to the illuminating oil itself. (570.)

Mr. EMERY testifies that fully 200 by-products of petroleum are used for medicinal purposes, besides the use of aniline dyes. Lubricating oils and paraffine wax are not, strictly speaking, considered by-products. The wax may be taken out of refined oil at a certain period of distillation, if it is profitable to do so, or it may be broken up by heat and left in the illuminating oil. Until recently the various by-products were not of very great value. The witness has sold paraffine wax as low as 1½ cents per pound within 3 years, but it is worth to-day from 3 to 4 cents per pound. Paraffine wax is used largely in making joints of pipes, and in covering all electrical conductors, as insulators. It is mixed with stearin for making candles.

Mr. Emery acknowledges that the Standard Oil Company has greatly developed the amount, quality, and sale of by-products, but declares that other active refiners could have devised the same methods if they had had the opportunity. As a matter of fact, during a long period of time the Standard Oil Company had the exclusive control of the refining business, and naturally was the only one to make improvements. Many of the inventions in this regard have been made in Europe.

Mr. Emery does not know whether the by-products of petroleum may equal in value the refined oil, as stated by the Standard Oil Company. His own refinery uses Bradford crude oil, which is specially rich in lubricants. He makes, for the most part, only the crude stock for refined by-products, such as cosmoline, but sells from \$30,000 to \$35,000 worth of them monthly. (627, 628.)

Mr. PHILLIPS believes that so far as the processes of producing and refining crude oil are concerned, the independents are on a par with the Standard, but the Standard has an advantage in selling, because of its accumulated capital enabling it to handle all the by-products, etc. The superior utilization of the by-products partly accounts for the greater profits of the Standard Oil Company. (599, 602.)

Mr. DAVIS states that a large refinery with facilities for making gasoline and other by-products is much more profitable than one which makes only illuminating and lubricating oil. But it is scarcely a safe investment to attempt to manufacture these by-products. The railways are large consumers of lubricating oils, and these deal almost exclusively with the Standard Oil Company. Even a large investment would be likely to prove unprofitable. The refinery controlled by the witness had a capacity of about 8,000 barrels per week. A refinery of that size is confined to the manufacture of illuminating and lubricating oil. This refinery sold its by-products, without finishing them, to Scofield, Shurner & Teagle, and elsewhere, but never secured a profit from them. (355, 356.)

E. Purchase of coal.—Mr. LEE believes that the Standard Oil Company, like other large consumers of coal, is able to secure it at low prices. It practically fixes what it will pay. This has an injurious effect on the wages of coal miners. (378.)

Mr. ARCHBOLD denies that the Standard obtains special rates on coal and declares that it buys in the open competitive market. (533.)

F. Advantage in foreign trade.—Mr. ARCHBOLD urges especially, as a justification of the methods of the Standard Oil Company, that large aggregation of capital has been absolutely necessary to the successful development of the export trade in petroleum. Any restriction in the amount of capitalization allowable would greatly hamper that company and other large American corporations in competing with foreign corporations. The Standard Oil Company has been conspicuously active in reaching out and securing markets over the entire world. If it had not been so energetic, the producers of oil in Russia and elsewhere would have secured a very much larger proportion of the foreign markets than they now possess. The Standard Oil Company constantly meets strong competition, probably on the whole growing competition, from oil produced in other countries. Mr. Archbold submitted a partial list of corporations and firms engaged in producing and refining petroleum in Russia and various other countries, with their approximate capitalization, showing how extensive is the investment and how vigorous the competition encountered by the Standard Oil Company. The Standard Oil Company has no interest in any of these concerns. In Russia, especially, the business is getting into the control of men of great wealth and ability—such as the Rothschilds, Nobel Brothers, and prominent English capitalists. There is a rapidly developing petroleum industry in Japan, Sumatra, and Java.

The witness submitted the following statements, showing the amount of refined and of crude oil, respectively, produced in different countries, with the percentage of the total assigned to each. He maintains that most of the refined oil produced by each country is the product of crude oil obtained in that country. (562-567.)

World's production of refined illuminating oil, 1897.

[Barrels of 50 gallons.]

Product of—	Barrels.	Per cent of total.	Product of—	Barrels.	Per cent of total.

Mr. Archbold also submitted the following statement showing the proportion of the total export trade in petroleum products done by the Standard Oil Company. (568.)

Value of exports.

Total value of petroleum products exported from United States for the years 1861 to 1871, inclusive, amounted to	\$199,030,333
Value of exports from 1872 to 1898, inclusive (i.e., since the organization of the Standard Oil Company)	1,246,846,381
Value of exports by Standard Oil Company	1,126,401,021
Standard Oil Company, 90.34 per cent of total.	

Mr. PAGE states that the Standard owns a number of bulk tank ships, and also some sailing vessels which are used for shipping oil in cases to the far East. The Standard has many agencies throughout the world, mostly under charge of American citizens.

Mr. Page testifies further that the price of Russian crude oil is much lower than that of American oil and that the Russians are competing actively in various markets, but especially in the Asiatic trade. They have tank steamers for transporting oil to India and even to China and Japan.

The witness has heard and believes that the German government recently issued an order requiring the government-owned railroads to burn exclusively Russian oil in preference to American. (791, 792.)

Opponents of the combination present little evidence about foreign oil, although they make statements concerning the conditions of export trade generally, the efforts of independent refiners to find foreign markets, and the methods of competition of the Standard Oil Company against these. (On this subject see p. 121.)

Mr. PHILLIPS, however, maintains that the Standard Oil Company was not the pioneer in shipping oil abroad, but that before its existence a large proportion of the foreign countries had already been reached. He believes that a wider distribution of petroleum would have existed if the Standard had never been formed. The Standard Oil Company has no better talent than others engaged in the same business. (600, 601.)

On the general subject of export trade Mr. LEE states that ordinary export oil would not be permitted to be sold in some of our States, but is still of quite high quality. (Compare pp. 135, 136.) The independent oil is superior to that sold by the Standard, which, the witness believes, is partly refined from Lima oil. About 40 per cent of all the crude oil manufactured is exported in the shape of refined oil, while lubricating oils and by-products would bring the proportion up to fully 50 per cent. Germany is the largest oil market in the world, both the Standard and independents doing extensive business there. Russian oil is not largely used in Germany. The Standard Oil Company controls most of the business in France. The independents do little business in Asia, Africa, or South America. (273-278; compare Phillips, 600.)

Mr. EMERY submitted an estimate of the amount of American oil consumed in European countries. Germany consumes about 6,000,000 barrels; Great Britain, 3,000,000; France, 2,000,000; Norway and Sweden, 1,200; Denmark, 600,000. Practically all of this is sold by the Standard Oil Company, the largest exportation of the independents in any one year having been about 400,000 barrels, almost entirely sold in Germany. (617, 623.)

Mr. LEE believes that the Standard Oil Company is not transporting oil from this country in tin cans as largely as it formerly did, but that it is supplying its Eastern markets largely with Russian oil and making tin cases abroad.

In reply to this Mr. ARCHBOLD submitted a statement showing the number of tin cans manufactured by the Standard Oil Company in this country and elsewhere from 1894 to 1898. These figures show, for the most part, a steady increase in the number manufactured in the United States, and relatively less increase abroad. A total of 223,116,660 5-gallon cans were manufactured in this country and less than 18,000,000 abroad. The company is compelled by freight rates and tariffs to manufacture some tin cans in Mexico and in Italy, but nowhere else.

During the same five years there have been exported from the United States 109,861,221 cases (each case containing two tin cans) of petroleum, all but 7,463,041 by the Standard Oil Company, while the exports from Russia have been only 53,128,120 cases. The witness submitted a detailed statement of exports to different countries by the Standard Oil Company and by other American refiners, to show the enterprise of the Standard Oil Company in securing foreign markets. (533-538.)

G. Quality of trust product.—Mr. LEE believes that the oil refined by the Standard Oil Company has deteriorated in quality within 20 years, since the company has used a considerable proportion of Lima oil for refining, which contains arsenic and sulphur. (275.)

To this statement Mr. ARCHBOLD replies that, as the result of careful work on the part of the Standard Oil Company, it has been possible to secure refined oil from Ohio crude fully equal to that from Pennsylvania crude. The independent refiners of Pennsylvania have done a great injustice to the producers of Ohio by depreciating the quality of their product and attempting to keep it from being considered on the exchanges as a good delivery. (532.)

Mr. EMERY denies, from his experience as a refiner, having in his employ as good a chemist as can be found, that sulphur can be entirely eliminated from oil containing it. The chemists of Europe who test the quality of oil imported always detect the presence of sulphur, and on that account practically exclude oil refined from Ohio crude. Such oil is confined in its use almost altogether to the United States and Mexico. (624, 625.)

Mr. RICE declares that Ohio oil is decidedly inferior, and that, despite modern improvements in refining it, the sulphur and other impurities can not all be removed. The refined oil from Ohio crude is mixed with that from Pennsylvania crude, but even then it forms a white film on the lamp chimney, gives an offensive smell, and is otherwise unsatisfactory. Mr. Rice quotes a circular from the Waters-Pierce Oil Company, issued in 1890, in which Ohio crude is stated to be inferior. The company issuing this circular was a member of the Standard combination.

Up to 1895 oil manufactured from Ohio crude was not acceptable on the New York exchange, but in that year, under the influence of the Standard Oil combination, it was made a good delivery. Mr. Rice declares that the profits of the Standard Oil Company on oil refined from Ohio crude are much higher than on other oil, owing to the lower price of the crude. (735, 736.)

Mr. GALL says that his Canadian customers seem to consider the American oil which he sells them much better than what the Standard was selling as Pennsylvania oil. He believes that the Standard had been giving them the Ohio product for years, and putting it off as Pennsylvania oil. Mr. Gall sells Ohio oil also, and makes a difference, generally of about a cent or a cent and a half a gallon, between it and Pennsylvania oil. (681.)

Mr. MONNETT refers, without quoting it in detail, to a pamphlet issued in England declaring that American oil furnished by the Standard Oil Company is inferior to Russian oil, and describing the illegitimate means resorted to by the Standard Oil Company to prevent Russian oil from entering English markets. (319.)

Mr. ARCHBOLD declares that this pamphlet referred to is a scurrilous publication issued by one of the yellow journals of London, which has been practically subsidized by Russian producers. A committee of Parliament investigated the quality of American and Russian oil and fully upheld the safety and quality of American oil. (546.)

Mr. Emery explains in detail the methods of refining and the various qualities and tests of oil. When the crude oil is distilled the lighter products pass over first—first the volatile gas, next gasoline, benzine, etc. The first illuminating oil to pass over is the lightest in weight, and will burn at about 110 degrees (fire-test). It will flash at 85 degrees, but will then go out. This grade of oil was

formerly legally used in most of the American States, but later laws have raised the fire test, so that most oil used in this country is from 120 to 150 degrees fire test. Only a limited amount of oil of this higher test can be obtained from crude, and in obtaining it the quality of the lighter grades of oil is lowered.

Mr. Emery considers that 110-degree oil is entirely safe for ordinary use. It will not give so bright a light as 150-degree oil, but will last longer in burning.

One hundred and ten degree oil is the ordinary export oil. The Germans apply a rigid test to secure the maintenance of this standard. Mr. Emery believes that, in view of the lower price of such oil, it is the most economical for use, and that this is the reason why it is admitted freely by Germany. (623-626.)

VII. CRUDE OIL.—EFFECT OF COMBINATION.

A. Early history of oil industry.—1. *Discovery and progress.*—Mr. BOYLE presented detailed statements concerning the early development of the oil industry. Oil was refined from coal and shale in considerable quantities during the early part of the present century. Rock oil or petroleum was often observed in connection with salt wells and springs in Pennsylvania and Kentucky and elsewhere, and in 1829 a large flow of oil was secured from a salt well in Kentucky. As early as 1853 and 1854 there was organized effort to produce petroleum from oil springs and surface gravel in Pennsylvania. E. L. Drake was the first to experiment in drilling especially for oil, and he was first successful in August, 1859.

The industry developed very rapidly, but was greatly hampered by the difficulty of transportation—since the oil district was 30 miles from the nearest railway—and by the lack of barrels for transportation. The first flowing wells were struck in 1861, and produced so largely that prices declined from \$20 per barrel to practically zero, there being then no way of storing and transporting oil in such quantities. There was a marked improvement in 1862, and during 1863 transportation by boats enabled oil to reach markets more readily and improved prices. In order to float boats the device was used of damming the water in Oil Creek and letting it out in sudden floods. Small pipe lines for conveying oil were introduced about this same time, and during 1863 and 1864 railways were constructed into the oil territory. During the latter year many stock companies were formed and speculation was excessive. The price of oil was forced up in July, 1864, to \$13.75 per barrel. The cost of transportation was still very great, and during the war a tax on crude and another on refined petroleum was levied by the National Government.

In 1865 improvements in drilling, such as the use of casing, torpedoes, etc., were introduced, and pipe lines began to be used more extensively for transporting oil from the wells to railway points. The cost of transportation of oil from Pithole to New York in December, 1865, was \$5.55 by one route and \$4.59 by another.

During 1866 and 1867 production increased rapidly and prices fell greatly. There were a number of bank failures. Mr. John Ponton, in a pamphlet entitled "The Crisis in the Oil Region," estimated that a profit of \$504 could be secured during the first year of production of the average oil well, costing \$3,500, by the use of gas as fuel for pumping; but if coal should be necessary for pumping there would be a loss of \$1,507. He advocated a restriction of output. But meantime improvements in transportation were being made, which soon brought renewed prosperity to the oil producers.

In 1869 the Petroleum Producers' Association of Pennsylvania was organized especially for the purpose of securing statistics of production, and thus protecting the producers from the depression of prices by speculators. A circular stating the objects of this association was submitted by the witness. Prices were higher than during any of the three previous years. There was, however, a decline during 1870. About 1871 the first discoveries of oil in the Bradford field were made, but the field was not developed until considerably later. During 1872 the Butler and Clarion fields were rapidly developed, so that there was soon an overproduction of oil. (BOYLE, 405-421, 454.)

Mr. EMERY also makes a brief statement of the early history of the oil business, dwelling especially on the history of pipe lines. (603, 604.)

2. *Oil exchanges and speculation.*—In the early days of the oil business the prices received by producers were determined in part by the so-called dump men, owners of "dumps" or tanks, who gathered up, and sold again, the oil of the small producers. The dump man developed into a refiner later on; and as a refiner he especially made a business of handling oil from the bottoms of tanks, not salable on the general market. The agents of larger refineries went from place to place, buying oil directly from producers and often following the prices of the dump men. Later on these agents became more systematic in their methods and finally met regu-

larly at special places to deal with producers. Thus originated oil exchanges, which at first were more in the form of chambers of commerce, but later took on more distinctly the form of exchanges. The oil exchanges at Titusville, Oil City, and Franklin were organized formally about 1871. These became numerous and speculation upon them rapidly increased, both among producers themselves and among outside persons. The producers who refrained from speculation invariably got wealthy, while those who speculated became poor. (BOYLE, 448-451.)

B. Statistics of production and prices.—Crude oil is produced in a number of different States of this country and in numerous foreign countries, especially Russia. For statistics of the world's production, by countries, see above (p. 134). The quality known as Pennsylvania oil, which is also found largely in New York, West Virginia, and a part of Ohio, is considered much superior to Ohio or Lima oil and that found in California and other States, as well as to Canadian and Russian oil.

The following statement was submitted by Mr. Archbold. (568.)

Crude oil production, by States, years 1896, 1897.

[Barrels of 42 gallons.]

States.	1896.	1897.	Increase or decrease.	Increase or decrease.	Average value per barrel.	
					1896.	1897.
				<i>Per cent.</i>		
Pennsylvania	19,795,770	18,439,180	1,356,590	6.9	\$1.186	\$0.795

Total	60,864,401	60,496,499	367,902	0.6	.900	.676

Total value of production, 1896 \$58,518,709

Total value of production, 1897 40,829,611

Decrease 17,689,098

1. *Pennsylvania oil.*—Mr. Boyle and Mr. Archbold submitted the following table showing the average daily production of Pennsylvania crude oil from 1870 to 1898, the average price of crude oil per barrel of 42 gallons and of refined per gallon, and the variations in stocks on hand. (435, 547.) It should be noted that the price of refined oil includes the value of the barrel, worth about 2½ cents per gallon. (But see, as to value of barrels, Mr. WESTGATE, p. 1332.)

Production and prices of Pennsylvania oil.

Year.	Average daily production.	Average price per barrel.	Refined, per gallon.	Stocks increased.	Stocks decreased.	Total stocks.
	<i>Barrels.</i>			<i>Barrels.</i>	<i>Barrels.</i>	<i>Barrels.</i>
1870	15,350	\$3.90	\$0.20½	208,872		544,626

1891	98,191	.66½	.06½	6,047,719		15,343,238
1892	91,328	.55½	.0607	2,052,155		17,395,389
1893	85,236	.64	.0524		5,284,206	12,111,183
1894	84,334	.83½	.0519		5,774,403	4,336,777
1895	84,320	1.35½	.0736		1,174,872	5,161,905
1896	82,815	1.19	.0698	4,488,678		9,650,583
1897	96,357	.78½	.0691	1,239,069		10,789,052
1898	85,206	.91½	.0681	752,101		11,541,753

Since 1870 the daily production has increased 450 per cent; the price of crude oil has declined 75 per cent, and the price of refined about 75½ per cent.

Mr. LEE gives figures showing the highest and lowest prices of crude oil for each year since 1869 to 1897, and explains some of the chief fluctuations. The South Improvement Company was formed in 1872 and largely controlled transportation, by this means depressing prices of crude oil. New discoveries of oil in Butler County further decreased prices, but in 1876 and 1877 the working out of this field and increased speculation again raised prices largely. The rise in 1883 was due to the practical giving out of the Cherry Grove field, opened in the previous year, and to the decline in the Bradford field. The increase from 1888 to 1890 was due to restriction of production by agreement. The heavy production of the McDonald field then greatly reduced prices, while the increase in 1895 and 1896 was made arbitrarily by the Standard Oil Company. (279, 283).

2. *Ohio oil.*—As to the quality of Lima oil, see p. 185.

Mr. DAVIS states that the Macksburg oil field, about 25 miles from Marietta, produces a high quality of oil, containing much paraffine, and known as "white-sand oil." More recently the Corning field has been discovered 40 miles northwest from Marietta. The oil is in many ways as valuable as the white-sand oil, but the price is fixed by the Standard Oil Company, through its pipe lines, at 17 cents per barrel less. The production of oil in these two fields is about 10,000 barrels per day, while in the Lima field it is about 60,000 barrels per day. (352, 353.)

3. *Canadian oil.*—The production of crude petroleum in Canada is confined almost altogether to western Ontario. The total production is about 750,000 or 800,000 barrels per year. Practically all of this is refined and used in Canada, and in addition about 38 per cent of the entire amount of refined products used is imported from the United States. Most of the crude production is in the hands of small owners, but the Standard Oil Company controls about 25 per cent. (GALL, 672, 673.)

Mr. Gall testifies that Canadian oil is much inferior to Pennsylvania oil, and even to Ohio oil. The difference in price made by his company between Pennsylvania and Ohio oil is usually about 1½ cents. The witness believes that the Standard Oil Company has been selling Ohio oil in Canada under the name of Pennsylvania oil. (681.)

4. *Russian oil* is not as productive of illuminants as American oil, and the refined oil is inferior in quality, containing some sulphur. The basis of American oil is paraffine, and from 75 to 78 per cent of illuminating oil can be obtained from Pennsylvania crude. The basis of Russian oil is asphalt, and it gives only about 25 per cent of refined oil. California oil also has an asphalt base. (EMERY, 626.)

As to amount of production and strength, of competition of Russian oil, see above pp. 183, 184.

C. *Method of leasing lands.*—In many instances oil producers buy lands, but the more common custom is to lease them for oil purposes, giving the owner one-eighth. The lease usually runs for 20 years. (DAVIS, 864.)

Mr. MONNETT mentions one-sixth as the average amount that goes to the landowner in Ohio. (311.)

The proportion of the value of oil going to the landowners as royalty has varied from one-half to one-eighth, the latter proportion now prevailing in most parts of the oil fields. (ARCHBOLD, 539, 540.)

D. Cost of drilling wells—wages.—Mr. EMERY, who has drilled several thousand oil wells, testifies that in the lower oil regions, where wells are sometimes as deep as 2,000 feet, the cost is often \$3,000 or \$10,000. In the upper region the cost was formerly about \$2,500, the average, perhaps, for both regions being about \$4,000. But it would be impossible to drill wells at these figures to-day, since the price of iron, which is largely used in casing, has doubled. (661.)

Mr. DAVIS states that the cost of producing oil had decreased materially until 1899, when the increase in the price of iron for casing, tubing, and machinery increased the cost of sinking wells. The cost of production varies greatly in different fields according to the depth, the kind of casing which must be used, and the amount of production. The cost of drilling may be \$5,000 or \$6,000. Expert drillers are paid \$4 or \$5 per day. (363, 364.)

Most labor in the drilling of oil wells is done by contract, so that it is difficult to estimate the average rate of wages or the average length of time the men are employed. The wages differ considerably according to the skill of the worker; a first-class man is likely to earn as much as \$1,000 in a year. The labor, both in drilling and in refining oil, is well cared for, and is loyal to the producers and to the Standard Oil Company. (BOYLE, 483, 484; see also p. 145.)

E. Proportion of crude production controlled by Standard.—Mr. LOCKWOOD testifies that the Standard Oil Company owns a large percentage of the Ohio fields, and has been acquiring much production in the Pennsylvania and Virginia fields. Its policy has been to depress the price of crude oil, so that lands could be purchased at low figures. Thus the price of Lima oil was kept down to between 10 and 20 cents, after the Standard Oil Company had introduced its pipe lines and had influenced the railways to fix high rates for transportation, so that it practically fixed the price of oil. The purchases in the Pennsylvania and Virginia fields also were made just before the great rise of prices in 1896 and 1897. By increasing prices after these purchases of land the public is made to pay for the investment. Moreover, stocks had been reduced to between 4,000,000 and 5,000,000 barrels, and the law of supply and demand, as well as the desire of the Standard Oil Company to make profits, forced an increase of price. (402, 403.)

Mr. PHILLIPS confirms the general features of this testimony. (592.)

Mr. LEE states that the Standard Oil Company controls from 23 to 25 per cent of the production of crude oil. More than half of the entire production is owned by men who produce less than 10 barrels a day each. The owners of from 40 to 50 per cent hold stock in the independent pipe-line and marketing companies. The effect of the production of crude by the Standard Oil Company has been to reduce prices. It is able, by its large capital, to drill deep wells and secure high production. It has also leased large blocks of oil lands in West Virginia and has held them for future development. (281, 282, 285.)

Regarding the Ohio field, Mr. DAVIS testifies that when territory is found to produce oil in profitable quantities, various companies, such as the South Pennsylvania Oil Company, the Ohio Oil Company, the Carter Oil Company, etc., which are believed to be creatures of the Standard Oil Company, buy up the ground largely. They have plenty of capital and pay fair, even exorbitant prices, overbidding their competitors. (354.)

In reply to the charges of Mr. Lockwood that the Standard Oil Company had used its control of prices of crude oil to depress the value of oil lands and secure practically the entire control of crude production in Ohio, Mr. ARCHBOLD submitted the following statement, showing the amount and proportion of the total crude output, both in Pennsylvania and in Ohio, produced by the Standard Oil Company. It is to be noticed that while the proportion of Pennsylvania oil produced by that company has rapidly increased, the proportion of Lima oil controlled by it for some time decreased rapidly and later increased only slowly. (While Mr. Lockwood's statement referred to ownership of land and Mr. Archbold's to production of oil, some degree of correspondence between land ownership and oil production would naturally be expected.) (561.)

Production of Pennsylvania and Lima crude oil by Standard Oil Company and others, years 1890 to 1898, inclusive.

[Expressed in barrels of 42 gallons.]

Year.	Pennsylvania oil.			Lima oil.			Grand total.		
	Total production.	Standard Oil Co. production.	Standard Oil, per cent of total.	Total production.	Standard Oil Co. production.	Standard Oil, per cent of total.	Pennsylvania and Lima production.	Standard Oil Co. production.	Standard Oil, per cent of total.
1890	30,065,807	2,618,637	8.71	15,014,882	8,400,508	55.95	45,080,749	11,019,205	24.44

F. Effect of Standard Oil combination on prices.—1. *Opponents of combination.*—Several witnesses testify that the practical monopoly of the Standard Oil Company in the purchase of crude oil has been employed by it to depress prices, greatly to the injury of producers (e. g., RICE, 689). The Standard Oil Company has control of far the greater proportion of the pipe lines in the oil regions, and producers have no choice but to sell to these pipe lines at the prices fixed by them. The evidence to the effect that this power of depressing prices has been used in order to buy up oil lands at low figures has been already referred to (p. 139). It is especially claimed by witnesses that the practice of the Standard Oil Company since 1895 of disregarding the prices of oil made on the exchanges has given it still greater control over the market.

Mr. LEE's testimony is especially full on this point. He states that there has been a great fall in the price of crude oil since 1870, when it was \$4.90 per barrel, the price in 1897 ranging from 65 to 96 cents. This decrease, while partly due to new discoveries of oil, cheaper drilling of wells, and improved methods, is largely owing to the combination of refiners. For 10 years previous to 1895 the average price of crude oil was kept below 80 cents, which is to most producers unprofitable. This low price was not mainly due to overproduction. Thus, when the Bradford oil field was opened in 1881 production increased greatly, so that 39,000,000 barrels were in stock in 1884, yet the price was reduced only to \$1.12 or \$1.15, as compared with \$1.24 in 1880. In 1887 the stock had fallen to 31,000,000 barrels, and the production was about the same as in 1884, but the price had fallen to 66 cents. The arbitrary limitation of production from 1887 to 1889 increased prices somewhat, but less than was anticipated. Since January, 1895, the Standard Oil Company has ceased paying the market prices for oil, as fixed on the exchange, and has simply announced the prices it would pay daily. The range of prices, however, has been higher since 1895, averaging \$1.05. This has not been chiefly due to increased competition of independent pipe lines, although they pay often from 1 to 9 cents per barrel more than the Standard Oil Company, and undoubtedly tend to keep up prices. (Compare p. 112.) The sudden increase in price to \$2.60 in 1895 was entirely arbitrary, apparently intended to injure independent refineries.

Crude-oil producers as a body have been losing steadily, but they continue to drill and to pump oil, largely because of the speculative possibility of striking large wells and the hope of better conditions in the future. The witness believes that the cost of producing a barrel of crude oil now averages from \$1 to \$1.20. Mr. Lee declares that he believes, in fact, that the oil-producing counties would have been better off if they had never produced a barrel of oil. The price of local pipage has not been reduced by the Standard Oil Company since 1870.

The producer who happens to strike a well with a large flow could of course sell much below the producer whose well yields a small quantity, since the cost of drilling in each case is about the same. But the greater part of the production is from small wells and the price must be sufficient to enable them to be drilled, aside from the matter of the speculative drilling of wells in hope of large production. The result is that the owner of a large well secures a very high profit from a normal price. (279-283, 293, 294.)

Mr. MONNETT states that the laws of various States and other obstacles make it almost impossible for independent pipe lines to be laid. The Cudahys of Chicago have been trying for years to secure pipe-line privileges in Indiana and Ohio. The companies belonging to the Standard charge prices so high as to prevent independent refiners or producers from shipping. Producers in Ohio are practically compelled to sell to the pipe-line companies at the price they may fix, having no other means of outlet. The pipage rate in Ohio everywhere is 20 cents per barrel. The Buckeye Pipe Line Company has had a gross income in three years of \$19,495,495 from Ohio business, while the landowners have received for the leases of their land only \$9,747,000. (310, 311.)

In the Ohio field, to judge from Mr. Monnett's testimony, the Standard Oil Company itself produces much of the oil by lease from the owners of the land, paying them 60 cents per barrel for one-sixth of the oil. In any case it practically fixes the price of crude oil by its control of the pipe lines. The witness gives a rough estimate that the Standard makes gross sales of about \$120,000,000 and a profit of about \$50,000,000 annually from Ohio oil. The witness does not know precisely what proportion of the crude product is controlled by the Standard Oil Company, but thinks it is much more than one-half. By its control of transportation the Standard causes the producer to accept less than the true value of his oil. (311, 315, 318, 319.)

2. *Reply of Standard Oil Company.*—As evidence that producers have received fair prices and profits, Mr. BOYLE submitted a table of figures showing the annual production of crude oil by barrels since 1860, the average price, and the total value. Combining these figures for 10-year periods, we find that from 1860 to 1869 the 27,944,500 barrels produced were valued at \$111,142,603; from 1870 to 1879, 108,535,306 barrels were valued at \$207,892,617; from 1880 to 1889, 241,544,250 barrels were valued at \$206,623,341, while from 1890 to 1899, 293,220,986 barrels were valued at \$253,113,285. Mr. Boyle also submitted the following table showing the number of wells drilled and the estimated cost of drilling for decade periods as compared with the value of crude oil produced:

Years.	Wells drilled.	Cost per well.	Total cost.	Value of crude oil.
1860-1870	5,000	\$4,000.00	\$20,000,000.00	\$111,142,603.00
1870-1880	20,259	3,000.00	60,777,000.00	207,892,617.47
1880-1890	32,132	2,000.00	64,264,000.00	206,623,341.56
1890-1899	43,490	2,000.00	86,980,000.00	253,113,285.00
Total	100,881	232,121,000.00	778,771,847.03

If we suppose that one-fourth of the value of crude oil produced has gone to the owners of the lands, the balance remaining to the producers, after deducting the cost of wells and the amount paid to land owners, for the entire period of 39 years, would be \$351,957,885. The average cost of lifting oil may be estimated at 25 cents per barrel, which would amount to \$87,989,471, leaving for the profits of the producing business \$263,968,413, or an average per year of \$6,768,420.

In the figures for the cost of wells are included 15,000 dry wells, the statistics for producing and dry wells being carefully compiled by newspapers in the oil district since 1875. The witness does not consider that the amount of bonus or rental paid by producers to owners of oil lands before opening production should be considered as an element in the cost of production. It is essentially a speculative venture, in which the producer takes his chances of great profit or of loss. (438-435.)

Mr. ARCHBOLD replies, especially to the statements of Mr. Lee as to the unprofitableness of crude-oil production, that the population of tens and even hundreds of thousands which now occupies the oil regions, once a comparative wilderness, and the cities, towns, and railroads, are sufficient evidence that the industry has been beneficial. He also submitted a table, nearly identical with the one submitted by Mr. Boyle, showing the yearly production and total valuation of crude oil since 1859. Deducting from this total valuation one-eighth to represent the royalty going to owners of the land (this royalty being at the rate of one-eighth now prevailing, although as much as half of the oil has sometimes gone to land owners), Mr. Archbold arrives at the conclusion that the producers themselves have received a total of \$673,704,847 during the past 40 years.

In further evidence on this point Mr. Archbold submitted a list of about 800 prominent oil producers who are, he declares, prosperous and well to do. (538-540, 553.)

On this point Mr. PHILLIPS testifies that a great many of the oil producers are quite well to do, although very few are considered millionaires; but the majority are comparatively poor. They would have been much better off but for the depression of prices by the Standard. (599.)

Mr. ARCHBOLD declares that the estimates made by Mr. Monnett as to the amount of gross receipts and profits of the Standard Oil Company from Ohio oil are altogether unintelligible and ridiculous. He does not consider it worth while to go into a detailed reply. He seems, however, to understand that Mr. Monnett's estimate referred to sales of refined-oil products in Ohio. It did refer, in fact, to the total sales of products made from Ohio crude. (544.)

3. *Overproduction and prices.*—So far as there has been a depression of prices below remunerative rates, it is explained by Mr. BOYLE as due to overproduction. He points out that there has been a constant tendency toward such overproduction of crude oil. Thus for nearly 10 years, during the eighties, stocks of approximately 40,000,000 barrels of oil were being carried by the producers in tanks owned by the National Transit Company. This large surplus on hand greatly depressed prices. Attempts to restrict production have usually failed, especially because of new producers coming into the field. (See below, p. 143.)

The witness is inclined to believe that depression in prices of crude oil to some extent injures refiners as well as producers. A medium price is more advantageous for refiners than either a high or a low one. Nevertheless the witness does not think that the Standard Oil Company has made less profits during times of low prices for the crude product. The value of the Standard's stock has not fallen. The maintenance of its profits has been due in part, apparently, to the reduction in the cost of refining oil during the period of low prices for crude oil. Notwithstanding the excessive production, especially during the eighties, Mr. Boyle believes that the producers of crude oil as a class have made enormous profits. The cost of production has greatly decreased in many cases.

To the suggestion that producers might gain by refining their own oil and saving the profits that come to separate refiners, Mr. Boyle replied that such attempts had frequently been made, but had always failed. The producers are likely to lack the experience and skill in manufacturing and in disposing of goods which are necessary. Mr. Boyle also admits that during the earlier periods of the oil business such smaller refineries controlled by producers were handicapped by railroad discriminations in favor of large refiners. (452-456.)

6. *Method of fixing prices.*—The Seep Purchasing Agency of Oil City, on behalf of the Standard Oil Company, posted on January 23, 1895, a notice, quoted by Mr. BOYLE, that thereafter the prices paid by it to oil producers would be "as high as the markets of the world will justify, but will not necessarily be the price bid on the exchange for certificate oil"—that is to say, the Standard Oil Company thereafter fixed prices itself in view of the condition of production and demand throughout the world.

This change was rendered necessary, as stated in the notice and as believed by Mr. Boyle, by the fact that very little oil was actually being sold on the exchanges, so that it was unfair for the prices fixed by such sales to apply to the great quantity of oil handled by the Standard Oil Company. Moreover, speculators on the exchanges had been able to manipulate prices in ways not justified by market conditions. Producers themselves sometimes sold oil to themselves at higher prices in order to fix the price for the Standard Oil Company.

Speculators also resorted, especially during the early eighties, to the practice of circulating false rumors concerning the production and discovery of wells for the purpose of illegitimately influencing prices. Out of this evil grew up the practice among the larger speculators of employing "scouts" to watch the developments in different fields and give information as to the production. The large stocks which were on hand during this period enabled bear speculators to sell short in large quantities without ever covering their sales, and the effect was to depress prices to producers.

Mr. Boyle admits, practically, that the producer has little part in making the price of oil under the new system, although he has the option to refuse the price offered. The claim of the Standard Oil Company is that the markets of the world determine the price.

The effect of the practice of fixing prices in this way has been to make fluctuations less marked and to keep the margin between the crude and refined oil more uniform. Mr. Boyle supposes that as soon as crude oil advances refined oil is also advanced in about the same proportion, in most cases. The witness submitted detailed tables showing the average price of crude and refined oil by months for the 4 years preceding the adoption of this new policy and corresponding prices for numerous dates during the 4 years after the policy was introduced, the latter figures showing apparently all the changes that have been made in the price

of crude oil by the purchasing agency. He calls attention to the fact that the price of refined oil includes the value of the barrel, which amounts to about 24 cents per gallon, while the value of crude oil is in bulk.

The amount of oil bought by the Seep Purchasing Agency, which is believed to be a representative of the Standard Oil Company, is probably about 80 per cent of the crude oil produced, both in Pennsylvania and Ohio. Mr. Boyle believes that this method of fixing prices by the Standard Oil Company is beneficial to the producers and the consumers also. The amount of speculation in oil has been very greatly decreased, and speculation tended to depress the price to producers, especially when it took the form of gambling on margins. The real effect of the present system is that the consumer makes prices.

On being questioned further concerning the methods of fixing the prices of crude oil, Mr. Boyle stated that he believed that the price of crude followed closely the price of refined, and that the price of the latter was fixed by the demand for oil in Europe. There is undoubtedly some person connected with the Standard Oil Company whose business it is to watch foreign markets and to decide whether the company shall sell oil at the figures offered by consumers abroad. The various local markets throughout the country have little influence in determining the price of crude. The changes in the price of crude are usually a full cent at a time, occasionally 2 cents, or even more. (BOYLE, 436-439, 446-451, 479.)

Mr. ARCHBOLD testifies that the Standard Oil Company purchases about 80 per cent of Pennsylvania crude oil through its general purchasing agent, Mr. Joseph Seep, of Oil City, and his 40 or 50 subagents. The attempt is to fix prices in accordance with the world's markets.

"We have before us daily the best information obtainable from all the world's markets as to what the offerings are and as to what it is possible to sell for, and we make from that the very best possible consensus of prices, and that is our basis for arriving at the current price."

Q. "Generally speaking, are the relative prices of the crude oil and the refined oil kept substantially uniform?"—A. "Oh, substantially so. Of course it is not always the same. Of course it seems possible sometimes to get a higher price, and we are glad to avail ourselves of the opportunity, and sometimes we have to take a closer margin and still buy the crude, and there, of course, we suffer a loss." (571.)

Mr. DAVIS testifies that when a producer has oil to sell he goes to the agent of the pipe-line company, who ascertains by telegraph the amount of oil to the credit of the producer and the price offered. The price is fixed altogether by the Standard Oil Company, though occasionally brokers make bids at higher rates for a few days. A producer can sell his oil to any agent wherever he may happen to be. (362.)

H. Restrictions of production.—Somewhat in confirmation of Mr. Boyle's statement concerning the effect of overproduction in depressing the prices of crude oil is the fact that various attempts have been made by the producers to restrict the output of oil with the avowed purpose of thereby raising prices. The most effective of these restrictions was that of 1887.

1. *Early restrictions.*—Mr. BOYLE describes in detail the earlier movements for restricting production. The Petroleum Producers' Association of Pennsylvania was organized in 1869. A circular issued in 1870 by this association states that its object is primarily to gather correct information concerning the production of oil, stocks on hand, and prospects, in order to protect producers against misrepresentation and depression of prices by purchasers. About this time it became evident that stocks were continually increasing, and a movement was inaugurated under the name of the Petroleum Producers' Agency to store all oil above a certain amount and keep it from the market. A circular of this agency was submitted by the witness in which its purpose was stated to be to prevent unwise competition between producers and sellers, and to secure a fair price for whatever amount of oil the world requires, unaffected by the fact that there is more produced than consumption demands. Calculations were made to show that an increase of daily production depressed prices in much more than equal proportion. The agency proposed to buy oil at \$5 per barrel so long as the general market would warrant it and to take all remaining oil for storage at the expense of the producers.

This plan failed to go into operation because of the enormous production in Butler County.

The first effective shut-down in production and drilling for crude oil was brought about in 1873. For 80 days there was an almost entire cessation of output in all the fields. The increased prices thus secured tended to encourage drilling immediately after the restriction was dropped, but the chief cause of the rapid decline in prices during 1873 and 1874 was the discovery of new wells and the deepening of

the old wells to the "fourth sand." In 1874 there was a local shut-in movement in Clarion County. In 1876 the plan was again started of pooling the surplus oil as a means for advancing the market, but other conditions soon raised prices so that it was unnecessary. Large new production during 1878 led to the formation of the Producers' Protective Union, which lasted for 2 years. This organization soon became aggressive and brought suits against pipe-line companies and the Standard Oil Company. It had, however, little beneficial effect, production being practically not limited at all and prices steadily falling. (426-428, 453-459.)

2. *Restriction of 1887.*—Mr. BOYLE further testifies that in 1884 there was again an attempt to establish a general combination of producers to restrict drilling. Through the refusal of the operators who were securing large wells in the new Thorn Creek district, the movement was only partially successful, but it led to the organization of the Producers' Associated Oil Company, with a capital stock enabling it, when necessary, to purchase oil property in order to curtail production.

This new organization made an agreement with the Standard Oil Company in 1887 for reducing production. The conditions at that time were worse than ever before. Great stocks of oil had been accumulated through the heavy production of the Bradford field. The stock in 1887 was 31,000,000 barrels. Prices were below a remunerative point, while the Standard Oil Company was losing by the deterioration of the oil in store. This movement to restrict production was the most thoroughly organized which had ever been attempted, and its success was rendered certain by the fact that all the different branches of the oil industry were alike interested and were cooperating. Although there were 14,000 producers of crude oil, fully 85 per cent of them were brought into the agreement. The movement developed gradually from June to October, 1887, being furthered by various secret and public meetings of the Producers' Protective Association. Conferences were held with the Standard Oil Company and an agreement was finally made between the association of producers and that company by which production was to be restricted for one year by one-third, beginning November 1, 1887. This contract was carried out with fair success.

In consideration of the advantage to itself, the Standard Oil Company turned over to the producers 6,000,000 barrels of oil at the market price at the time of the contract, 62 cents per barrel, the producers thus securing the profit from the anticipated rise in prices. Mr. Boyle states that when the oil was actually turned over the price already stood at 71 cents.

In 1888 further agreements were entered into among themselves by the producers in the association, especially with a view to equalizing the amount of oil which could be produced by each individual. These agreements were called respectively the boundary-line drilling contract and the interior drilling contract. The most important provisions follow:

"Hereafter the number and location of wells for the production of petroleum along or adjacent to the exterior boundary line of any producer on either side of said line shall be determined by the agreement of the producers interested in the production along said boundary line, or, in case of their failure to agree, by three arbitrators, one to be chosen by the producer or producers on one side of the said boundary line, one to be chosen by the producer or producers on the other side of the said boundary line, and the third arbitrator to be chosen by the two so chosen by the producers aforesaid.

"But no decision of such arbitrators shall be permitted to deny altogether the right of a producer to drill when he can not drill at all without drilling within 800 feet of the boundary.

"No well shall be drilled on or within 800 feet of any boundary line until its location shall have been fixed by agreement of adjoining producers or by award of arbitrators, as hereinbefore provided. * * *

"We, the undersigned, producers of petroleum, do hereby agree to and with each other that we will not drill any wells for the production of petroleum on any farm or tract of land owned by us, except along or adjacent to exterior boundary lines of our respective properties, to a greater extent, exclusive of boundary-line wells, than one producing well for each 20 acres and each fractional part of 20 acres; provided that additional wells may be drilled with the consent of the local assembly of the Producers' Protective Association for the district in which the particular property may be situated and of the general executive board of said producers' association, or, in case such consent can not be obtained, upon the allowance of the arbitrators, or a majority of them, one to be chosen by the person or persons desiring to drill, one to be chosen by the local assembly of the Producers' Protective Association for the district in which such property is situated, and the third by the two so chosen."

It was not found possible to bring all the producers into the contract. The owners of large wells in the new Washington fields made a great profit by keep-

ing up production at the higher prices. Nevertheless the effect of the movement was admitted by Mr. Boyle to have been a "hypnotizing" of competition. The price of crude oil was advanced about 20 cents per barrel by the restriction, so that the producers benefited materially.

The price of refined oil to consumers was advanced about three-fourths of a cent per gallon, a difference somewhat less than the advance in crude oil. The loss thus occasioned was partly borne by the Standard Oil Company as the chief refiner of oil, but the company gained by the added prosperity of the producers and the added harmony between them and itself. (Boyle, 428-432, 459-462.)

Mr. LEE testifies, in less detail, confirming a number of the essential facts stated by Mr. Boyle concerning the restriction of 1887. He adds that as a result of this restriction the production was decreased by 17,500 barrels per day, and by 1889 the stock on hand was reduced to 9,000,000 barrels. The price was raised somewhat by this movement, but not to the extent anticipated, and the arrangement was thereafter abandoned. (284, 288.)

Mr. ARCHBOLD testifies that the shut-down movement of 1887 was entered into by the Standard Oil Company only at the urgent request of the producers, and was not in any sense initiated by the company. This statement was supported by Mr. Phillips. (540.)

3. *Effect on labor.*—According to Mr. BOYLE, the effect of the agreement of 1887 to practically cease the drilling of new wells was naturally to injure the laborers in that occupation. For their relief 1,000,000 barrels of oil were set aside from the 6,000,000 purchased by the producers from the Standard Oil Company, while the Standard added another 1,000,000 barrels for the same purpose, the profits from the rise in price of this oil being paid to the drillers. Meantime the drillers had formed a strong organization and adopted a scale of prices.

The purpose of thus setting aside 2,000,000 barrels of oil for the drillers was rather a business than a philanthropic one. The object was to prevent the oil-well workers from engaging in other fields or working for producers outside of the shut-in agreement. It had been the custom during previous shut-downs also to take care of labor. The drillers did not suffer especially during the shut-down, since drilling for gas was active, and the restriction did not refer to Ohio and Indiana oil. (431, 432, 482, 483.)

VIII. EFFECT OF COMBINATION ON LABOR.

Mr. ARCHBOLD testifies that the Standard Oil Company has never had any serious difficulty with its employees in any department; that the entire 35,000 are well paid, contented, and zealous for the company. Mr. Archbold believes in combination of labor just as in combination of capital. Labor and capital are moving on irresistibly toward more thorough organization in themselves and closer and more harmonious relations between one another. (542, 543, 565.)

Mr. LEE, an opponent of the combination, admits that the Standard Oil Company has paid and still pays good wages, although not better than those paid by the independent refiners. The employees are mostly competent and of high class. Nevertheless the tendency, by closing down part of the refineries, is toward displacement of labor, and the centralization of industry in one organization gives it a greater control over labor than competing concerns could have. The Standard Oil Company pays very high salaries to its superintendents and department heads, so there may be no net saving in wage payments by the combination. (286, 288-290; see also p. 139.)

Mr. CLARK does not consider that the wages paid by the Standard Oil Company to its employees at distributing stations are higher than those of independent dealers or than wages generally. He worked for the company for 6 years, beginning as a boy of 19, and his pay was raised only from \$15 per month to \$2.50 a day, the latter sum being received when he was manager of the station at Newark, Ohio. He hired men or boys to drive hoops, fill barrels, care for drays, etc., at from 60 to 75 cents per day. They could have earned more elsewhere, but hoped to work up. Hours of labor average fully 12 per day. Mr. MATHEWS says that this statement as to hours of labor is misleading and untrue. (848, 849, 494.)

IX. RAILWAY DISCRIMINATIONS BEFORE INTERSTATE COMMERCE ACT.

A. *Discriminations admitted before interstate-commerce act.*—Much testimony was presented concerning the granting of special rates to the Standard Oil combination, and other forms of discriminations or advantages obtained by it from the railways. A large part of the testimony brought forward by opponents of the

combination, especially so far as regards actual rebates or differences in rates, related entirely to the period previous to the adoption of the interstate-commerce act in 1887. While the witnesses defending the combination presented some evidence in rebuttal as to these early discriminations, they admitted frankly that the practice of securing rebates and special rates had existed prior to the adoption of that act, while denying absolutely any violation of law since that time.

Thus Mr. ARCHBOLD testifies that previous to 1887 practically all shipments of oil, or of freight of any kind in large quantities, were made under special contracts between large shippers and the railways. The tariffs issued gave no clew to the actual rates charged. This practice was injurious, on the whole, to the shippers, and was particularly contrary to the interests of the Standard Oil Company. The various shippers, owing to the fear that some competitor might receive lower freight charges, cut prices to consumers in order to retain trade, thus often giving consumers more than the reduction from the published schedules actually secured. Since the practice has ceased the condition of business has been much more settled, and the witness attributes the increased profits of the Standard Oil Company since the passage of the interstate-commerce act in part to this change. These special contracts were usually made at the instance of the railway companies, soliciting traffic of large shippers, rather than at the instance of the shippers themselves. (526, 527, 580.)

Mr. PAGE also admits that the Standard received rebates from published rates, but declares that all other oil shippers did the same, and that in certain instances others received greater rebates than the Standard. He cites as instances shipments by Scofield, Shurmer & Teagle, and also shipments from Nashville by independent dealers.

Mr. Page states further that, so far as his own experience goes, the Standard Oil Company in securing such rebates made no arrangement with the railways as to what they should charge to other shippers. (789, 790.)

Mr. ROCKEFELLER also admits the former universality of the practice of rebates from tariff rates. He adds as follows:

"Each shipper made the best bargain he could, but whether he was doing better than his competitor was only a matter of conjecture. Much depended upon whether the shipper had the advantage of competition of carriers. The Standard Oil Company of Ohio, being situated at Cleveland, had the advantage of different carrying lines, as well as of water transportation in the summer, and taking advantage of those facilities made the best bargains possible for its freights. All other companies did the same, their success depending largely upon whether they had the choice of more than one route. The Standard sought also to offer advantages to the railways for the purpose of lessening rates of freight. It offered freights in large quantity, carloads and train loads. It furnished loading facilities and discharging facilities. It exempted railways from liability for fire. For these services it obtained contracts for special allowances on freights. These never exceeded, to the best of my present recollections, 10 per cent. But in almost every instance it was discovered subsequently that our competitors had been obtaining as good, and, in some instances, better rates of freight than ourselves." (795.)

Witnesses opposing the combination, however, consider that these early discriminations inured almost wholly to the benefit of the Standard Oil Company. Thus, Mr. EMERY, Mr. LOCKWOOD, and Mr. RICE, in particular, declare that the growth of the Standard Oil monopoly between 1870 and 1890 was almost entirely due to railway discriminations, and other witnesses less specifically state the same thing. They claim that the Standard received large rebates from railways on shipments made by its competitors. The gross profits of the combination from discriminations are alleged to have been enormous, ranging into millions of dollars yearly.

Mr. RICE declares with great emphasis that railway discrimination was the "father and breeder of trusts." Were it not for discriminations neither the Standard Oil Company nor any other of the great combinations would have been possible. The Standard Oil Company was the first and may be considered the parent of all trusts. It had a direct influence in the organization of many later combinations. (688.)

As to the question whether the Standard Oil Company in its earlier days received payment from the railways on oil shipped by its competitors, Mr. ROCKEFELLER, in an affidavit submitted to the commission, stated that he knew of no such instance. The only case where such an arrangement was temporarily entered into was that of George Rice, hereafter referred to, which was made by an agent and which was repudiated by the company, the money received being refunded. (795.)

Mr. PAGE also testifies that, so far as his own experience goes, no such rebates on shipments by competitors have been received. (790.)

Mr. ROCKEFELLER also denies that the Standard Oil Company increased its profits by the advantages it received from railways. "Whatever advantage it received in its constant efforts to reduce rates of freight was deducted from the price of oil. The advantages to the Standard from low freight rates consisted solely in the increased volume of its business arising from the the low price of its products." (795.)

B. South Improvement Company.—The first conspicuous case of discriminations between shippers in the oil business was in connection with the South Improvement Company, as to which much testimony was presented.

1. *Organization and relation to Standard Oil Company.*—Opponents of the Standard combination maintain that the South Improvement Company was organized by the same men who formed the Standard combination, and that the methods of the company were continued by the Standard. Mr. Lockwood declares that 10 out of 18 incorporators of the South Improvement Company were later connected with the Standard combination. "Mr. Emery and Mr. Rice, on the basis of the testimony of William G. Warden before a committee of Congress on March 30, 1872, quote the list of stockholders of the South Improvement Company as follows: William Frew, 10 shares; W. P. Logan, 10 shares; John P. Logan, 10 shares; Charles Lockhart, 10 shares; Richard S. Waring, 10 shares; W. G. Warden, 475 shares; O. F. Waring, 475 shares; P. H. Watson, 100 shares; H. M. Flagler, 180 shares; O. H. Payne, 180 shares; J. A. Bostwick, 180 shares; William Rockefeller, 180 shares, and John D. Rockefeller, 180 shares. Of these men Messrs. Flagler, Payne, William Rockefeller, J. D. Rockefeller, and Bostwick were members of the Standard Oil Company." (Lockwood, 384, 385; EMERY, 610-619; RICE, 690.)

Mr. BOYLE, editor of the Oil City Derrick, believes that the South Improvement Company had its origin among the railways rather than among refiners, and states that the conviction was general in the oil region that the Pennsylvania Railroad and others were really behind the organization. The change in the locality of the production of oil toward the south tended to reduce the business of the Erie and New York Central railroads in handling oil, and they sought this agreement with a view to keeping up their proportion of the traffic. The agreement was made with certain Philadelphia, Pittsburg, and Cleveland refiners. The South Improvement Company purchased one of the numerous special charters which had been granted by the legislature prior to the new constitution of 1873. This charter had been intended chiefly for other purposes, but was very broad in its scope. (431-433.)

Mr. EMERY submitted the full text of the charter of the South Improvement Company. From this it appears that by act of the Pennsylvania legislature of May 1, 1871, the South Improvement Company was created and vested with all the powers conferred by the act of April 7, 1870, on the Pennsylvania Company. The powers of this company, as shown by its act of incorporation, were extremely broad, including the authority "to construct and operate any work or works, public or private, designed to include, increase, facilitate, or develop trade, travel, or the transportation or conveyance of freight, live stock, passengers, or any other traffic, by land or water, from or to any part of the United States." The company was also empowered to exercise the right of eminent domain, for the purpose of erecting any work in connection with the exercise of its powers, and to hold the securities of other companies, or in any other way to combine with them. (607, 608.)

2. *Contract with railroads.*—Mr. LEE (p. 283), Mr. LOCKWOOD (pp. 385, 400), and Mr. RICE (pp. 689-695) refer in greater or less detail to the contract made between the South Improvement Company and the trunk railroads reaching the oil regions, securing discriminating rates in favor of that company. The testimony of Mr. EMERY on this point, however, is much more detailed and is followed in the summary given below.

Mr. EMERY submitted a copy of the contract made between the South Improvement Company and the Pennsylvania Railroad, dated June 18, 1872. By this contract the South Improvement Company agrees to ship 45 per cent of all the oil transported by it over the Pennsylvania Railroad, and to divide the remainder equally between the Erie Railway and the New York Central. The South

* It appears from the testimony of Mr. EMERY that the Committee of Congress referred to did not publish any report, and possibly did not even keep a record of the testimony taken. The chairman of the committee was Mr. Giffill. Mr. Emery was in Washington at the time and has a complete copy of the testimony, taken either from newspapers or directly from stenographers. Mr. Boyle confirms the fact that there was such an investigation. (667, 668.)

Improvement Company also agrees to furnish suitable tankage facilities for shipping petroleum and receiving it at its destination, and to keep records of the amount of petroleum and its products shipped over the railroads concerned, both by itself and other parties.

The railways agree to allow the South Improvement Company rebates on all petroleum and its products carried by them, and to charge all other parties not less than the full rates specified in the contract. These gross rates, according to several witnesses, were very much higher than those previously existing (e. g., Lockwood, 884, 885). The railroads also agree to furnish to the South Improvement Company manifests and way-bills of all petroleum or its products transported over their lines by all parties whatever.

It was, however, provided that similar rebates and advantages should be paid to any other party who should furnish an amount of transportation equal to that furnished by the South Improvement Company, and equal facilities for promoting the petroleum trade. This is the provision under which it is claimed that all parties had equal opportunities and advantages from the railways. Mr. Emery, however, insists vigorously that it would have been absolutely impossible for anyone else to secure the amount of business necessary to meet this requirement of the railways. The very contract itself prevented any competitor from obtaining such equality in business.

A further clause of the contract provides that the railway "shall at all times cooperate, as far as it legally may, with the party hereto of the first part, to maintain the business of the party hereto of the first part against loss or injury by competition * * * and to that end shall lower or raise the gross rates of transportation over its railroads and connections, as far as it legally may, for such times and to such extent as may be necessary to overcome such competition."

The following are some of the gross rates and rebates provided for in the contract:

Rates and rebates according to contract.

ON CRUDE PETROLEUM.

	Gross rate. ^a	Rebate. ^a
From any common point to—		
Cleveland	\$0.80	\$0.40
Pittsburg80	.40
New York	2.56	1.06
Philadelphia	2.41	1.06
Baltimore	2.41	1.06
Boston	2.71	1.06

ON REFINED OIL, ETC.

From Pittsburg to—		
New York	\$2.00	\$0.50
Philadelphia	1.85	.50

From Cleveland to—		
Boston	2.15	.50
New York	2.00	.50
Philadelphia	1.85	.50
Baltimore	1.85	.50

^a For each barrel of 45 gallons.

Mr. EMERY insists that this contract between the South Improvement Company and the Pennsylvania Railroad was actually signed and went into effect, notwithstanding statements to the contrary. He quotes from the testimony of P. H. Watson, president of the South Improvement Company, before a committee of Congress on April 5, 1872, in which Mr. Watson stated that the contract was approved by the board of directors of the South Improvement Company at a meeting at which he (Mr. Watson) was not present. The original contract has been submitted in evidence in previous investigations and is signed by P. H. Watson and by J. Edgar Thompson, president of the Pennsylvania Railroad. (610-619.)

Mr. RICE declares that the arrangement by which the South Improvement Company was to receive rebates on all oil shipped by its competitors meant that practically the rebates paid to the Standard on each barrel of oil shipped by itself were 19 times greater than the nominal amount of rebate provided in the contract, since the shipments of independent refiners were 19 times greater than those of the Standard Oil Company. On this basis he calculates the amount of rebates received by the South Improvement Company as arranged from \$7.60 to \$25 per barrel. (689-695.)

Mr. ARCHBOLD testifies that the contract entered into by the South Improvement Company and the railways was abolished before it became operative. He has no knowledge that a similar contract was shortly afterwards made with the Standard Oil Company, and denies that the Standard in any sense continued the policy of the South Improvement Company. He has always disapproved of that company. (540, 560.)

3. *Abandonment of discriminating contract.*—So great was the indignation among oil producers and refiners over this contract of the South Improvement Company that it was canceled almost before it went into force, and the charter of the company was subsequently repealed. (LOCKWOOD, 399, 400; BOYLE, 423.)

Mr. EMERY submitted a copy of the report of the executive committee of the Petroleum Producers' Union describing the growth of knowledge and of public opinion concerning the contract of the South Improvement Company, and showing how the indignation meetings which were held led finally to the abandonment of that contract and to the repeal of the South Improvement Company's charter. On March 25, 1872, the railways which had been concerned in the arrangement with the South Improvement Company signed a contract with the representatives of the oil producers and refiners, agreeing that the former rates on crude and refined oil should remain unchanged and that there should be no rebates or drawbacks allowed, or any discriminations made in any way whatever. This contract contained a list of rates which should prevail—in most cases about 40 per cent less than the gross rates provided for in the contract with the South Improvement Company. (630.)

C. *Later discriminations during the seventies.*—1. *General history.*—It was the general opinion of witnesses opposed to the Standard combination that this contract made with the railway companies was not lived up to for any length of time, but that discriminations in favor of the Standard Oil Company, fully as great and as unjust as those provided for in the contract with the South Improvement Company, continued to be made throughout the seventies. Practically all of the statements made are based on previous testimony in suits and official investigations.

Thus, Mr. EMERY declares that heavy rebates continued to be paid to parties connected with the South Improvement Company and the Standard Oil Trust from 1872 up to 1880, and that it was on this account that the great majority of the refineries of the independents were driven out of business. In evidence of this he submitted extracts from the testimony of Frank Rockefeller, an independent refiner, who had been driven out of business in Cleveland, before a committee of Congress in 1876. Mr. Rockefeller testified that the members of the Standard Oil Company had not hesitated to tell competing refiners in Cleveland that unless they sold their property to the Standard Oil Company it would become valueless, because that company was receiving advantages from the railways. He heard J. D. Rockefeller and H. M. Flagler make this statement. About 20 refineries in Cleveland sold out under the influence of this threat. Mr. Rockefeller was of the opinion that heavy rebates were being paid to the Standard Oil Company, and were being divided by that company with certain individual officials of the railways. He believed further that there was a pool or arrangement for dividing the amount of oil shipped among the various railways. (639-645; compare confirming testimony of RICE, 694.)

Mr. EMERY also cites the testimony of George H. Blanchard, then general freight agent of the Erie Railroad, before the Hepburn investigating committee in New York, that he had become convinced that the Empire Line had received a large drawback from the Pennsylvania Railroad within 2 weeks after the railroads agreed not to discriminate. Mr. Emery also submitted a letter from the general freight agent of the New York Central, dated September 9, 1874, increasing the open rates on refined and crude oil materially and allowing a rebate on refined oil equal to the amount paid for the transportation of crude oil by rail from the mouth of the pipe lines to the respective refineries upon the basis of 14 barrels of crude oil to every 10 barrels of refined shipped. It was further agreed that a rebate of 22 cents per barrel should be paid on all oil coming from pipe lines maintaining the agreed rate of pipage.

Mr. RICE declares also, on the basis of existing testimony, that at one time during the seventies the freight rate from Cleveland to New York for the Standard Oil Company was nominally 60 cents per barrel, from which was deducted the amount of transportation charges on crude oil from the oil wells to Cleveland, amounting to 35 cents per barrel on crude oil, on the basis of 14 barrels of crude to 10 of refined, so that the actual rate paid by the Standard Oil Company on refined oil was only about 11 cents per barrel. The freight rate to the competitors of the Standard at the same time was \$1.90 per barrel. (696.)

Mr. RICE, referring to the above-mentioned circular issued by the New York Central Railroad, in 1874, agreeing to refund 23 cents per barrel from the freight charges on oil coming from such pipe lines as maintain agreed rates of pipage, declares that this rebate practically destroyed the value of all independent pipe lines immediately. The pipe lines in the combination which maintained the agreed rates could bid 22 cents per barrel more for crude oil than their competitors and the latter could secure no business whatever. In support of this position Mr. Rice quotes the evidence of E. G. Patterson and the argument of Simon Sterne before the Hepburn committee in 1879. (695, 696; compare Lockwood, 385.)

Mr. RICE quotes from the testimony of Messrs. Lombard, Bush, and Gregory, independent oil refiners at the seaboard, as to conversations with Mr. Scott and Mr. Cassatt, of the Pennsylvania Railroad, apparently during the later seventies. Each of these gentlemen declared that he had asked these officers whether equal freight rates would be given to them if they shipped as much oil as the Standard Oil Company. The reply was that equal rates would not be given, and that the higher the freight rates were made the greater would be the discrimination against the independent shipper. These officers stated that the Standard Oil Company was the only power that could keep peace between the trunk lines. (698, 699.)

Mr. EMERY testifies that the result of the suit of the Commonwealth of Pennsylvania *v. The Pennsylvania Railroad* was the discovery of evidence which led to the finding of an indictment against John D. Rockefeller and others in 1879. The case, however, was never tried. The defendants attempted to secure a change of venue, and afterwards applied to the supreme court of Pennsylvania for relief, which they secured through some process of law not understood by the witness. Finally, on account of lack of funds and the fear of further delay, Mr. Campbell, president of the Producers' Protective Association, settled the case on receipt of \$40,000, which was used in defraying expenses. A contract was also made by which the railroad agreed to grant no more rebates. (662, 663.)

Mr. LOCKWOOD testifies that in the case of *Pennsylvania v. The Pennsylvania Railroad Company* it was testified by Mr. Cassatt that the open rate on oil at one time was \$1.90 per barrel, while the Standard Oil Company received a rebate of \$1.10 on oil shipped by itself and its competitors. The Standard also received allowances for terminal charges, the terminal facilities having been placed in its hands by the railways, which reduced the actual freight charges to 35 cents. A letter written in 1878 by Mr. Daniel O'Day to Mr. Cassatt stated that the New York Central and Erie roads were paying rebates of not less than 30 cents per barrel on all oil carried, and demanded from the Pennsylvania road a rebate of that amount, dating back several months. This rebate was granted, Mr. Cassatt having evidence that the roads above named were paying rebates, as stated, of from 20 to 35 cents. In another suit it was shown that the profits of the Standard Oil Company during 4 years at this period were more than \$2 per barrel of oil. (385-387; confirmed in certain details by Lee, 264.)

Mr. ROCKEFELLER, in an affidavit replying to interrogatories, states that to the best of his recollection the greatest rebates were paid by the railways from 1877 to 1879. The Standard then had an agreement for the special 10 per cent commission, and in addition rebates amounting, as the witness believes, to 64 cents on refined oil were paid by the railways to equalize with shipments made by the Erie Canal. These rebates, however, were open to all persons who shipped by rail. The impression of Mr. Rockefeller is that the Erie Railway, at least, did not collect the higher rate from the shippers and later make rebates from it, but actually lowered the rate to all shippers. (795.)

2. *Empire Transportation Company.*—Mr. LEE and Mr. RICE refer to the discriminations made by the railways against the Empire Transportation Company by which it was driven out of business. In 1877 and 1878 freight rates were cut to 8 cents per barrel during this fight. (Lee, 263; Rice, 696.)

Mr. ARCHBOLD explains the transaction by which the Standard Oil Company absorbed the Empire Transportation Company, referred to by Mr. Lee. The Empire Line and the Green Line were corporations whose stocks were owned by the officers and managers of the Pennsylvania road. Through these companies the railway became interested in pipe lines and in oil refining. The Standard

claimed that the road discriminated in favor of its own refineries. In view of this fact the Standard Oil Company refused to ship over the road, and thereby finally forced the sale of the pipe lines and refineries to the Standard Oil Company. (518, 514.)

3. *Gross amount of rebates. 1877-1879.*—Several witnesses referred to the testimony of Mr. Cassatt, in the case of *Commonwealth v. Pennsylvania Railroad*, in 1879, as to the high rebates paid from 1877 to 1879; and also to the estimate made by Mr. Emery before the House Committee on Manufactures in 1888 that the gross amount of rebates received by the Standard from October 17, 1877, to March 31, 1879, was no less than \$10,155,218. (LEE, 264, 287; LOCKWOOD, 386, 387; BOYLE, 458; RICE, 696, 697.)

Mr. ARCHBOLD explains the methods employed by Mr. Emery in making the estimates referred to by Mr. Lee as to the amount of rebates received by the Standard Oil Company from 1877 to 1879. Mr. Emery calculated that the Standard Oil Company received a rebate of 64½ cents per barrel on refined oil, and various rebates, ranging from 29 cents to 22½ cents, on crude oil. He took the average of all these figures, claiming 55 cents as the average rebate thus received by the Standard Oil Company. He then calculated this rate of rebate upon the entire consumption of oil in this country, from October 17, 1877, to March 31, 1879, reaching the total of \$10,155,218. This involved the entirely false assumptions that all oil consumed was shipped eastward, and all shipped by the Standard Oil Company; that all trunk lines paid the same rebate as the Pennsylvania Railroad; that the shipments of oil on which 64½ cents rebate was paid equaled the shipments of oil at the lower rebates. The evidence of Mr. Cassatt refers only to one trunk line, the Pennsylvania Railroad, and shows the following facts:

"I. That the Standard Oil Company shipped no oil over the Pennsylvania Railroad until July, 1875. That the Pennsylvania Railroad was then interested in refining in competition with the Standard, and not only allowed the Standard no preferences, but discriminated against it to such an extent that the Standard stopped shipping over the road in March, 1877.

"II. That in October, 1877, the Pennsylvania Railroad and the Standard entered into an agreement by which the Standard Oil Company was to have a commission of 10 per cent on all freight furnished by it in consideration of the Standard agreeing to equalize oil freights on the 4 trunk lines.

"III. That this agreement did not effect a discrimination even to that extent as against other shippers over the Pennsylvania Railroad prior to May 1, 1878, because said shippers had contracts extending to that date, which were excepted in the contract with the Standard.

"IV. That the Pennsylvania Railroad was willing and offered to carry oil for all shippers on the same terms with the Standard, excepting only 10 per cent commission, for which it demanded like considerations.

"V. That it did continue to carry for all shippers who did all their business over its line as low as for the Standard, commission included.

"VI. That shippers not using the Pennsylvania Railroad were able, after May 1, 1878, to get oil east by the Erie Canal lower than by rail, and shipped their oil by that route, in consequence of which the Pennsylvania Railroad shippers were paying greater freight rates than other shippers.

"VII. In consequence the Pennsylvania rate was reduced to those who continued to ship by that line 44½ cents on refined, making the net rate \$1, said 44½ cents being paid as rebate.

"VIII. For the same reason, namely, to meet canal rates, in July, 1878, the rate to those who shipped by rail was further reduced 30 cents, the 20 cents being paid as a rebate, and refunded back to May 1, 1878.

"IX. That these rebates were paid to all shippers who shipped entirely by rail, and were for the express purpose of putting them on an equality with those who shipped by canal.

"X. The same is true of the rebate allowed on crude oil during the same period, except 10 per cent paid to Standard and 22½ cents paid to the American Transfer Company, the latter being the pipe line's share of a through rate.

"XI. That the rebates which were paid from May 1, 1878, to equalize rail and canal shipments, were discontinued December 8 of the same year, when the canal was closed.

"XII. All payments of rebates entirely ceased March 31, 1879." (ARCHBOLD, 514, 515; compare BOYLE, 458.)

Mr. EMERY defended the estimate made by him, reaffirming his testimony on this subject presented before the House Committee on Manufactures in 1888 (pp. 242-247). The three separate figures for rebates, which were taken to secure the

average of 55 cents, on which Mr. Emery based his estimate, were respectively 64½ cents, 51½ cents, and 49 cents. The calculation of these rebates on the entire amount of oil shipped in every direction and by all the railroads is, in Mr. Emery's opinion, justifiable, since rebates are known to have been paid by all roads on practically all oil shipped. It appears that Mr. Cassatt also admitted in the case above referred to that the Pennsylvania Railroad alone had paid fully \$4,000,000 in rebates during this period, which is about the proportion calculated by Mr. Emery as paid by that road. Mr. Emery submitted in evidence the book of testimony in the case above named. (660, 661.)

4. *Tidewater Pipe Line, 1879.*—Mr. RICE states that in 1879 the Tidewater Pipe Company laid a 6-inch pipe to Williamsport, Pa., and secured special rates from the Reading and Central New Jersey railroads to the seaboard. In order to compel this company to sell out to the Standard Oil Company competing railways cut rates on freight to 15 cents per barrel from the oil regions to the coast, this amount barely paying for the fuel used in the engine. In support of this statement Mr. Rice quotes from the annual report of Mr. Gowen, president of the Philadelphia and Reading Railroad. (696, 697.)

D. *Arrangements between pipe lines and railways.*—1. *Contract of National Transit Company and Pennsylvania Railroad, 1881.*—Mr. RICE quotes from a letter of Mr. Newlin, attorney for the plaintiffs in the case of Fennalle & Despeaux v. The Pennsylvania Railroad Company, in the circuit court of the United States for the eastern district of Pennsylvania. This letter states that it was proved in that suit that a contract was made on May 6, 1881, between the National Transit Company and the Pennsylvania Railroad Company, by which the transit company guaranteed to the railroad one-third of the transportation of oil to the seaboard. The rates on oil thus carried, so far as furnished by the National Transit Company, were to be much lower than the open rates to the public. Thus, by way of Foxburg to Communipaw, the through rate, including the charge of the local pipe line to Foxburg, 20 cents, was 68 cents. On oil furnished by the pipe-line company to the railroad at Foxburg the pipe-line company was to receive as its share one-fourth of this open rate, namely, 17 cents, and one-half of the difference between this one-fourth and the public rate, i. e., 68 cents, was to be paid to the railway—that is, 25½ cents was to go to the railway. The difference between the share of the open rate coming to the railroad, 48 cents, and its share of this secret rate was 22½ cents, being practically a rebate of that amount to the Standard Oil Company, although the word rebate nowhere occurs in the contract.

This same letter refers to the contract made in 1884, more fully described below. (700-708.)

Mr. PAGE states that Mr. Newlin's deduction concerning the rebates to the National Transit Company under this contract of 1881 were erroneous. The court before which the suit referred to was brought granted a motion for nonsuit on the ground that the entire case rested on a misunderstanding of the terms of this contract. Mr. Page submitted a letter from Mr. Dodd, solicitor of the Standard Oil Company, together with a letter from George T. Bispham, of Philadelphia. The latter explains in detail the method by which Mr. Newlin made the calculation as to the amount of rebate above referred to. Mr. Dodd's letter quotes the two sections of the contract upon which Mr. Newlin's charge is based as follows:

"The through rates from the discharging point of the gathering pipes in the region to the destination of the oil, whether the same shall be shipped entirely by rail or by trunk pipe and rail, shall be fixed by the trunk-line railroad companies, provided they can agree upon the same, and the transit company agrees to accept thereof as the share due to its through pipes the proportions herein-after fixed."

"Whenever the through rate from the exit point of gathering pipe shall be less than forty (40) cents per barrel, the local or gathering pipe shall be considered as entitled to a rate equivalent to only one-fourth (¼) of the rate which shall be formed by the addition of the said through rate to the public rate which the local pipe charges, and one-half (½) of the difference between this one-fourth and the said public rate shall be considered as due and to be paid to the railroad company, but this difference shall never be such as to make the local pipe receive less than ten (10) cents per barrel."

Mr. Dodd's letter states that Mr. Newlin's error consists in confounding the "through rate from exit point of gathering pipe" with the "public rate which the local pipe line charges." Mr. Newlin takes one-half of the difference between 17 cents and 68 cents, the latter being the railway rate, as the sum paid over to the pipe-line company by the railways. As a matter of fact, he should have taken one-half of the difference between 17 cents and 20 cents, "the public rate which the local pipe line charges," there being no other reference to public rate in the

section. This half amounts to $1\frac{1}{2}$ cents instead of $25\frac{1}{2}$ cents. Moreover, the entire arrangement applies only where the through rate is less than 40 cents per barrel, and Mr. Newlin's inference to the contrary is baseless.

The fact is, as stated by Mr. Page and Mr. Dodd, that the Standard Oil Company paid exactly the same rate as other shippers over the Pennsylvania Railroad from and to the various points named, but that, on such oil as was carried partly by pipe line and partly by rail, a through rate was made, of which the pipe line naturally received a share. At this time the seaboard pipe line of the Standard did not reach beyond Hamilton, Pa. In order that the railway might be compensated in part in case it made an exceedingly low rate of freight, below 40 cents per barrel for the through rate, the pipe-line company agreed to take a part of the charge of its local pipes, which are to be clearly distinguished from its seaboard line, and pay it to the railway. So far from any rebate being made in favor of the Standard, this might be considered a rebate in favor of the railway. (Page, 759-763.)

2. *Contract of National Transit Company and Tidewater Pipe Company, 1883.*—Mr. RICE testifies that on October 9, 1883, an agreement was made between the National Transit Company and the Tidewater Pipe Company, which had previously been competing, for a division of traffic, the Tidewater Pipe Company being allowed $11\frac{1}{2}$ per cent of the total pipe-line transportation. Within 8 months after this contract was made the railways advanced the tariff rate on refined oils by $87\frac{1}{2}$ cents per barrel, thus giving a great advantage to the Standard Oil Company, which could pipe its oil to the seaboard at a cost estimated by Mr. Rice as amounting to 7 cents per barrel, and could then refine it there. Mr. Rice declares that the contract made with the Pennsylvania Railroad Company in 1884, more fully described by Mr. Emery, was intended to influence the railroad to maintain high rates to the seaboard, thereby giving the Standard a great advantage through its ownership of the seaboard pipe lines. Although this contract of 1884 may not now be actually enforced, the railways and the pipe lines still charge precisely the same rates to the seaboard, and these rates are very much higher than those which were charged by the railways prior to the agreement with the pipe lines. This statement is upheld by a quotation from Mr. Franklin B. Gowen, formerly president of the Reading Railroad. (738, 739.)

3. *Contract of 1884 between National Transit Company and Pennsylvania Railroad.*—Mr. EMERY refers to the contract made in 1884 between the National Transit Company and the Pennsylvania Railroad, a copy of which was submitted. This contract contains the following clauses:

"The transit company agrees that all petroleum brought to the Atlantic seaboard by all existing carriers, whether rail or pipe, now engaged in transporting such property, or which may hereafter engage in such transportation in conjunction with the transit company's pipe lines, shall be ascertained monthly, and so much of it as shall have been shipped in the refined state shall be reduced to its equivalent in crude oil by considering that one and three-tenths ($1\frac{3}{10}$) gallons of crude are required to make one (1) gallon of refined oil. It further undertakes and agrees that if of the total so transported the railroad company shall not have moved in its cars twenty-six (26) per centum thereof the transit company shall cause to be delivered to cars furnished by the railroad company at Milton, Pennsylvania, such quantity of crude petroleum as shall, when added to the amount which has been actually transported by the railroad company to the seaboard in said month, make the total transported by the railroad company in said month equal to said twenty-six (26) per centum."

"The railroad company shall be entitled to one-half of the current through rates thereon."

It was further agreed that all joint rates for the transportation of oil from any delivery point of the local pipe lines to any refining or terminal point should be fixed by the railroad company in concurrence with the transit company. It was also provided that the rates on refined oil and other products should be fixed upon the following basis: From railroad stations in the oil regions to any eastern point the rates should equal 1.3 times the current rate on crude oil to the same point; from Pittsburgh the rate to the east should be equal to 1.3 times the current charge on crude oil to such eastern point from rail points south of Oil City, deducting 1.3 times the charges for moving a barrel of crude oil from the local pipe to Pittsburgh.

By another contract made on the same day it was provided that, instead of the railway company being compelled to furnish cars and transport the additional oil which might be delivered to it by the National Transit Company to make up the 26 per cent agreed upon, the National Transit Company itself should transport through its pipe such extra quantity. The transit company should then pay

to the railway on the oil thus carried by itself the amount of freight payable to the railway at the rates provided for in the other contract, deducting a sum ranging from 6 to 10 cents per barrel as its compensation for transporting this oil.

Mr. Emery declares that the purpose of this contract was to keep up railway rates in order that independent shippers might not have equal facilities for shipping their oil to the seaboard. The railway accepted the percentage of traffic assigned to it as a compensation for thus keeping up rates. According to Mr. Emery the actual cost of transporting oil in a pipe line from the oil regions to the seaboard is not more than 5 cents per barrel. The railways have transported oil products for as little as 8 cents per barrel. Were it not for this contract they would have sought oil freight by cutting rates very materially. As it is, the rate fixed at the time of this agreement, by the consent of the National Transit Company, as provided, was 45 cents per barrel. It has since been raised and is at present 52.1 cents per barrel in bulk.

Mr. Emery declares further that about 26 per cent of petroleum products would necessarily be transported by rail in any case. Lubricating oil, tar, gasoline, etc., can not be shipped through pipe lines.

The witness believes that this contract, or one essentially the same, is still in force. He bases this statement upon the fact that a representative of the Buffalo, Rochester and Pittsburgh Railroad at one time proposed to Mr. Emery to arrange for shipping oil over that road to the Erie Canal, saying, "They do not see fit to recognize us as an oil road and I am going to do some of this business." As soon as these negotiations became known, however, the Buffalo and Rochester received its proportion of the business and discontinued the arrangements with Mr. Emery. (Emery, 663-667.)

Mr. RICE submitted a letter from Mr. Newlin showing that it had been proved in the case of *Ladenburg, Thalmann & Co. v. The Pennsylvania Railroad Company*, that under this contract of 1884 there had regularly been a deficiency in the share of the oil transported by the railway company, which was made up by a payment on the part of the National Transit Company. The following statement of the settlement for the month of September, 1884, furnished by the comptroller of the National Transit Company, shows the working of this system (702):

Total number of barrels so transported.....	1,574,961
Railroad company's share.....	409,490
Amount carried by railroad.....	325,596
Deficiency.....	83,894

On this deficiency the railroad company was allowed on New York oil, at one-half of the current through rate, 45 cents, equals 22½ cents per barrel, on 43,685 barrels.....	\$9,824.63
Less compensation allowed transit company for pumping the same, at 9 cents.....	3,929.85

Total.....5,894.78

The railroad company was allowed on Philadelphia oil for 40,229 barrels, at one-half current through rate, 40 cents, equals 20 cents per barrel.....	8,045.30
Less allowed National Transit Company for pumping same, at 8 cents.....	3,216.32

Total.....4,827.48

Total payment by the National Transit Company to the Pennsylvania Railroad Company for deficiencies for the month ending September 30, 1884.....10,722.26

Mr. Dodd, solicitor of the Standard Oil Company, in a letter submitted by Mr. PAGE, explains the reason for the arrangement provided for in the contract above referred to. The pipe line of the combination had just been completed to the seaboard. It could not have reached that point without the consent of the railway company, as no free-pipe-line law then existed in New Jersey. It was still necessary to have a traffic contract with the railroads and to deliver oil to the railroad at different points for shipment to Philadelphia. Accordingly, in addition to agreeing to divide the rates on oil carried partly by pipe lines and partly by rail, in the same way as was provided by the contract of 1881, it was further agreed that if the railway company did not move 26 per cent of the oil the transit company should pay it the deficiency. (761.)

4. *Pipe lines in Ohio.*—Mr. RICE states that it was testified by Mr. O'Day, general manager of the pipe-line system of the Standard Oil Company, in 1888, that the Chicago and Atlantic Railroad allowed the combination to lay its pipe lines on the railway's right of way from the Lima oil fields to Chicago without charge, in view of the profit to be received from the transportation of the material for constructing the line. After the pipe line was completed the railway rates on oil were raised from 30 to 87 per cent above those formerly existing, to the injury of independent shippers of oil. The present freight rate from Lima to Chicago is 49 cents per barrel, which is eight times as much as it costs the Standard to pipe its crude oil to its great refinery at Whiting. (739.)

Mr. RICE testifies that the receiver of the Cleveland and Marietta Railroad allowed the Standard Oil Combination to lay its pipe lines on the railroad's right of way from the Macksburg field to Parkersburg, W. Va., but refused to allow the pipe line of the witness even to cross the tracks of the railroad. (749.)

E. Refusal to furnish cars.—Mr. EMERY, when he was producing oil in the Bradford field and operating a refinery at Philadelphia, was unable to secure tank cars for transporting his crude oil to the refinery. The Pennsylvania Railroad owned 1,126 cars; but, as the witness believes, by order of the Standard Oil Company, all but 248 of these cars were sent out of the State, and he was unable to secure more than one in a week or longer for carrying on his business. An officer of the Rochester and Pittsburg Railroad told him that that road was threatened with a loss of its coal traffic if it hauled Mr. Emery's oil. (648, 649.)

Mr. LOCKWOOD also stated that one of the chief ways in which the railways discriminated against the independent refiners was by refusing to furnish cars to men who had oil to ship, or by furnishing only a few, or by delaying them unduly. (899.)

F. Discriminations against Mr. George Rice.—1. *Relations between Mr. Rice and the Standard.*—Mr. RICE, who has owned a refinery competing with the Standard Oil Company, at Marietta, Ohio, since 1876, makes numerous charges of discriminations against himself by the railway companies, especially on shipments toward the South. Most of these charges relate to the period previous to the passage of the interstate-commerce act.

Mr. Lockwood also refers to the discriminations against Mr. Rice, but his statements are less detailed than those of Mr. Rice himself, and need not be summarized. (890, 400, 401.)

Mr. ARCHBOLD testifies that Mr. Rice has not for many years been directly occupied in refining, but has made a business of attacking the Standard Oil Company—in which Mr. Archbold believes he has been financially aided by other opponents of the company—and of attempting to compel it to buy out his refinery at an exorbitant price. As far back as 1886 he demanded \$500,000 for the refinery, which was worth possibly \$25,000 or \$30,000. He based his demand on the statement that he had already inaugurated a number of suits before the Interstate Commerce Commission, and would push them unless it were granted. He also threatened to injure the Standard Oil Company by making what are known as "cut quotations" in the markets for refined oil. In support of these statements concerning Mr. Rice, Mr. Archbold submitted extracts from testimony of Mr. Rice on cross-examination in the suit of the State of Ohio v. The Buckeye Pipe Line Company, taken February 20, 1899. Mr. Rice then stated that he had at one time offered his plant to the Standard Oil Company for \$50,000, and still earlier for \$20,000; that later on he demanded \$500,000; and in June, 1890, sent one Mr. Orvis to the Standard Oil Company with a proposition to sell at the same amount, the understanding being that Mr. Rice was to do nothing further in the way of litigation or anything of that kind.

Mr. Rice's testimony in this suit also showed that he had personally employed two attorneys as counsel to assist the attorney-general of Ohio in a suit for contempt instituted against the Standard Oil Company. (559, 561, 562.)

Replying to these statements of Mr. Archbold, Mr. RICE testifies that no one ever furnished him a dollar to aid him in any fight he has made against the Standard Oil Trust or the railroads.

Mr. Rice also declares that the charge that he attempted to blackmail the Standard Oil Company in order to compel it to pay a large price for his refinery is entirely untrue. This has been the stock in trade of the Standard Oil Company in opposing him for 18 years. Mr. Rice quotes from his previous testimony in suits against the Standard Oil Company. In this Mr. Rice stated that in 1882 Mr. F. B. Squire, the present secretary of the Standard Oil Company of Ohio, came to him at Asbury Park and offered him \$250,000 for his oil properties, including his crude-oil-producing properties as well as the refining plant. In 1886 Mr. Rice offered his properties to the Standard Oil Company for \$250,000 and \$50,000 per year for 5 years. A letter from Mr. Archbold, dated December 13, 1886, submitted in evidence, shows that the Standard Oil Company was then willing to discuss the deal further with Mr. Rice. In 1887 the witness offered his "plant" (apparently only his refinery) at \$125,000, and \$25,000 annually for 5 years. It is not true, as charged by the Standard Oil Company, that Mr. Rice then said to Mr. Archbold that it would be better for the Standard Oil Company to make a deal with him, and that by so doing parties would be deterred from encouraging a line of action against the Standard Oil Company. The Standard has produced evidence in the form of letters from one Edgar P. Hill, addressed to the Standard Oil

Company, stating that he was in a position to negotiate with Mr. Rice, and advising the company to come to some arrangement with him, owing to the effect which he might have upon public opinion, and in bringing legal proceedings against the company. Mr. Rice denies having had any arrangement or conference with Mr. Hill on this subject, and states that these letters were thrown out as being incompetent evidence in a case before the courts in 1887, although they were afterwards submitted as evidence before the House Committee on Manufactures in 1888.

Mr. Rice declares that his property was actually worth the \$500,000 which he demanded from the Standard Oil Company. It is absurd to point out that he had offered to sell during the seventies at a lower price, since he had increased his plant to five times its previous capacity, and had included in the offer his producing properties, which consisted of about 200 acres of oil land, with from 150 to 200 barrels per day production. Mr. Rice calls attention to the fact that his testimony in the Ohio investigation has been misprinted, making it appear that negotiations for the sale of his property were conducted in 1897, instead of 1887, and making it appear that he testified that the capacity of his refinery was 10,000 barrels per annum instead of 100,000.

Mr. Rice also exhibited a pamphlet prepared by himself in 1881, entitled "Black Death," together with another pamphlet of the same title, with red printing on the margin, defending the Standard Oil Company and attacking Mr. Rice in strong language. (149-154.)

In rebuttal of the above evidence Mr. PAGE submitted an affidavit from Mr. F. B. Squire, dated December 1, 1899, stating that in 1876 Mrs. George Rice informed him that Mr. Rice wished to sell his entire oil property, including crude production, for \$24,000. The affidavit continues:

"I met Mr. Rice several times after this and he kept urging the matter. In the summer of 1881 or 1882 he invited me to meet him and his wife at Asbury Park. I did so. They there made me an offer to sell the property, stop all prosecutions, and be friendly with the Standard Oil Company for \$250,000—\$50,000 to go to me for my good office if I could bring it about. I reported the result to Mr. Archbold, including the offer to me, and it was immediately declined. I advised Mr. Rice, who called at my office the next day, and he stated that the company would regret this act. Immediately after this Mr. Rice published the pamphlet called 'Black Death.'

"F. B. SQUIRE."

Mr. RICE submitted a supplemental affidavit denying the statements made by Mr. Squire and further explaining his negotiations with the Standard Oil Company. The affidavit states:

"The real truth of the matter is that in the year 1876 Mrs. Rice and myself were boarding in New York at the same place with said Squire, and Mrs. Rice was acquainted with a Mrs. Waring, who was also an acquaintance of said Squire. That in some conversation with Mrs. Waring the matter of the oil business came up between them, and subsequently the said Squire spoke to deponent about his oil interests and said he possibly could sell some of it to the Standard Oil Company if he was so disposed to part with it. That the result of several conversations was that deponent informed Squire that if he or the Standard Oil Company desired to purchase my refining plant (which was only a small part of my entire oil properties and interests in the oil or petroleum business) he or it could have the same for \$30,000, as my wife was very desirous that I should get out of the refining business, and it was finally offered to Squire for that sum, which was not accepted.

"In the summer of 1882 I was stopping with my wife at Asbury Park, where Squire, on his own solicitation, came to see me, and he then and there offered me \$250,000 for my entire oil properties, including production, pipe lines, storage tanks, and refinery plant. I never offered the said Squire the sum of \$50,000 commission or any other sum to make said sale; nor did he suggest it or demand it, or any other sum whatever, nor did I say to him that the company would regret their act if they did not purchase from me, nor was I ever aware that said Squire had an office, except by hearsay, at Cleveland, Ohio. As this latter alleged interview occurred in the summer of 1882, as I testified before your commission, and as my pamphlet, 'Black Death,' was published on December 15, 1881, it is superfluous to swear to it, that, because said proposition was not accepted by said Standard Oil Company, I immediately published said pamphlet as retaliatory against said company."

Mr. Rice further testified that in 1889 he gave evidence, in the presence of Mr. Archbold, at a special term of the supreme court of New York City, concerning this offer of Mr. Squire to him, and that Mr. Archbold did not deny it. Further, in 1889, Mr. Archbold stated that in the negotiations between Mr. Rice and him

self in 1886, Mr. Rice's producing property was not referred to, and that he (Mr. Archbold) now heard concerning the producing property for the first time. This, Mr. Rice declares, substantiates his statement that the early offers made by him at a low price refer only to his refinery. (793, 794.)

2. *Louisville and Nashville Railroad.*—Mr. RICE submitted a letter from Chess, Carley & Co., a representative of the Standard Oil Company, to Mr. Culp, general freight agent of the Louisville and Nashville Railroad:

CHESS, CARLEY & CO., LOUISVILLE.

J. M. CULP, Esq., G. F. A.

DEAR SIR: Wilkinson & Co., Nashville, received car of oil Monday, 18th, 70 bbl., which we suspect slipped thro' on the usual 5th-class rate—in fact, we might say, "we know it did"—paying only \$41.50 freight from here. Charges \$57.40. Please turn another screw.

Yours, truly,

CHESS, CARLEY & CO.

JUNE 16, '81.

Wilkinson & Co. were Mr. Rice's agents at Nashville. Mr. Rice declares that within five days the rates to Nashville were raised 50 per cent. He does not know whether the Standard Oil Company paid this full rate or not, but thinks it fair to presume from general experience that it did not. He admits that it is an extremely difficult thing to prove that rebates have been received. (704, 705.)

Mr. PAGE refers to the alleged discriminations against Mr. Rice in connection with the above letter. He states that Chess, Carley & Co. were not then directly controlled by the Standard Oil Trust, although the Standard Oil Company of Ohio had an interest in the business. Mr. Carley was manager, with complete control. The letter quoted was written by Mr. Hathaway without the knowledge of Mr. Carley. Mr. Hathaway had formerly been in the employ of the Louisville and Nashville Railroad, and it was a common expression in the office of the railroad at that time that the machinery was loose and that it should be tightened by turning a screw. The expression, therefore, naturally crept into the letter. The shipment of oil by Mr. Rice to Nashville had been billed at less than the regular tariff rate which other shippers were paying, less than Mr. Carley himself was paying, and Mr. Hathaway calls attention to it as being an error to be corrected.

Mr. Page further testifies that he believes from information that Mr. Rice received the letter above referred to with a number of statements and letters which the railway company sent to Mr. Rice in connection with a later claim made by him concerning an alleged over charge. If the railroad had construed the letter as demanding a discrimination against Mr. Rice, it would not have allowed it to go into his hands in this way. Mr. Culp testified before the House Committee on Manufactures in 1888 that he had never seen this letter, but that he would have put the interpretation upon it which has just been mentioned. (763, 764, 785.)

Mr. RICE declares further regarding the above letter that he considers the explanations given of it by Mr. Culp and Mr. Carley before the House Committee on Manufactures in 1888 to be exceedingly lame and untrustworthy. He is willing to pit his own statements against those of these witnesses. It is certain that the railway rates were raised 50 per cent to Mr. Rice within 5 days. (747, 748.)

3. *Rates higher than from Standard's shipping points.*—Mr. RICE also testifies that in 1885 the railway rates from Marietta to Memphis and New Orleans were suddenly doubled without previous warning. The officers of the local railway at Marietta declared that this was done solely at the instance of the connecting roads, but Mr. Rice believed otherwise. The rate was restored after some correspondence, but in the following year the rates were again raised from 48 to 162 per cent. The witness declares that rates from Parkersburg, 12 miles from Marietta, where the Standard Oil Company has a large refinery, were not raised at all. He brought suit to forfeit the charter of the Cincinnati, Baltimore and Washington Railroad and the Queen and Crescent Railroad. He proved, as he states, that the former road had discriminated in favor of the Standard Oil combination from 48 to 162 per cent, and the latter from 29 to 212 per cent. He also proved other large discriminations. The court simply contented itself with deciding that the roads must not charge less per 100 pounds on tank-car shipments than on barrel shipments. This decision, Mr. Rice declares, was not obeyed. As the result of these unfair rates, Mr. Rice was driven out of 19 of his 24 agencies, losing his business in 39 out of 78 towns, all within 5 months. (710-714.)

4. *Rebates on crude-oil shipments.*—Mr. RICE submitted a letter from Mr. Pease, former receiver of the Cleveland and Marietta Railroad Company, to Mr. Rapello,

its solicitor, together with Mr. Rapello's reply, these letters having passed in February and March, 1885. Mr. Pease writes that Mr. O'Day, representative of the Standard Oil Company, had compelled Mr. Terry, of the railroad, to make a 35-cent rate on all oil shipped from the Macksburg field to Marietta by other shippers than the Standard, and to pay to the combination a rebate of 25 cents per barrel on all oil thus shipped, making \$25 per day, approximately, of clear money on Mr. Rice's oil alone. The Standard Oil Company itself was to pay only 10 cents per barrel. The receiver queries as to whether he might not be prosecuted on the ground of unjust discrimination. Mr. Rapello replies that such a prosecution might be possible, but believes that the profits from the arrangement with the Standard Oil Company, whose shipments are very much greater than those of Mr. Rice, are sufficient to compensate for any losses or sums which would have to be refunded.

Mr. Rice declares that he very soon discovered the discrimination which was being made against him, the former rate of 17½ cents per barrel having been doubled in order to make the 35-cent rate. Suit was brought against the railway company in the United States circuit court, and Judge Baxter ordered the receiver to be removed. In his opinion, which is quoted by Mr. Rice, he recites as proven the facts above referred to concerning the discrimination, and declares that the desire of the receiver to increase his earnings does not justify such discrimination. "Railroads are constructed for the common and equal benefit of all persons wishing to avail themselves of the facilities which they afford. * * * This franchise carried with it other and correlative obligations. Among these is the obligation to carry for every person offering business, under like circumstances, at the same rate. Unjust discriminations are in violation of sound public policy and are forbidden by law."

A master was appointed to ascertain the amount of rebates paid on Mr. Rice's oil to the Standard Oil Company, and this amount was duly recovered by him.

Mr. Rice states that the decision of Judge Baxter was made before the passage of the interstate-commerce act, showing that, in the opinion of the courts, discriminations were illegal without any special statute. In fact, the addition of a penalty of fine and imprisonment by the interstate-commerce act is considered by Mr. Rice to have had practically no beneficial effect, since the law is continually violated.

Being questioned as to whether receivers are not forced to make discriminations in order to compete with other roads which make discriminations, Mr. Rice declares that receivers, being representatives of the courts, ought to be especially circumspect in conforming to the law, whatever might be the effect upon the earning power of the railway. (706-709, 749.)

Regarding this last-mentioned case, Mr. ARCHBOLD quotes all the most important parts of the testimony of Mr. D. O'Day before the Committee of the House of Representatives in 1888. Mr. O'Day then testified that an arrangement was made by him in 1882 or 1883 with the Cleveland and Marietta Railroad Company for a through freight rate from the Macksburg, Ohio, oil fields to Marietta by pipe line and railway. The joint rate was to be 35 cents per barrel, and it was Mr. O'Day's opinion that 20 cents was to go to the pipe line, which was a Standard organization, and 15 cents to the railway, although a letter was submitted as evidence to show that the railway received only 10 cents. Mr. O'Day further testified that this rate of 35 cents was to apply to all oil transported by the railway, whether passing through the pipe line or not. At first it was arranged that a rebate equal to the proportion of the joint rate going to the pipe line should likewise be paid to the Standard Oil Company on all oil. About \$300 or \$250 was thus paid by the railway on oil not passing through the pipe line, but this sum was returned to the railway by the advice of Mr. Dodd, solicitor of the Standard Oil Company. This refunding was made before suit was brought to dismiss the receiver of the railway, a proceeding with which the Standard Oil Company had nothing to do. (556-559.)

Other statements of Mr. Rice refer to the period since the interstate-commerce act. (See pp. 164, 167.)

X. RAILWAY DISCRIMINATIONS SINCE INTERSTATE-COMMERCE ACT.

A. General statements.—1. *Opponents of combination.*—Much evidence was submitted on both sides as to the question whether rebates and other forms of discriminations in favor of the Standard Oil combination are being granted at present. Little testimony was brought forward to prove that it still receives actually lower rates for shipments over the same tracks than its competitors. The chief instance which it was endeavored to prove had to do with the underbilling of the weight

of cars shipped by the Standard. This is taken up in detail later on. Much evidence was also submitted as to (1) advantages in tank-car shipments over barrels; (2) lower rates where the Standard's shipments are the largest than where the independent refiners chiefly ship; (3) indirect advantages of different sorts.

Witnesses testifying in opposition to the Standard Oil combination, however, are of the opinion that direct discriminations and rebates are still received by the Standard Oil combination. This opinion is expressed by Messrs. LEE (292), LOCKWOOD (396), EMERY (380-333), PHILLIPS (301), and DAVIS (352).

Mr. RICE testifies that the officials of the Standard Oil Company are either presidents or directors in companies controlling one-fifth of the total railway mileage of the United States, and attributes this fact to their having secured discriminations from railways in the oil business. At a comparatively early date various railway officials had taken stock in the Standard Oil Company and the relation between the combination and the railways is still exceedingly close. Mr. Rice believes that railway tariffs on oil were formerly and are still practically dictated by the Standard. (688, 708, 727; compare MONNETT, 318.)

Mr. PAGE denies the charge that railway tariffs are ever issued from the office of the Standard Oil Company in New York, although he admits that the company has of course consulted with railroads in regard to the tariffs, as all large shippers probably do.

Mr. Page further denies that any official of the Standard Oil Company who is connected with any railway has ever made a special rate or arrangement for the Standard Oil Company, or has ever asked for any undue share of the business of that company. The Standard's business itself would necessarily suffer if attention were thus paid to the individual interests of different stockholders. (768.)

Mr. ROCKEFELLER makes practically the same statement as Mr. Page. (796.)

Mr. RICE expresses the opinion that the railways evade the interstate-commerce act by paying commissions to nominal agents for securing freight, although he doubts whether the Standard Oil Company finds it necessary to employ agents in order to secure such commissions. (727.)

Mr. PAGE denies absolutely that the Standard has ever received, either directly or indirectly, any commissions from railways since the interstate-commerce act. (769.)

Mr. EMERY submitted as evidence of the existence of discriminations generally the letter of the receivers of the Baltimore and Ohio Railroad to the Interstate Commerce Commission, dated December 22, 1898. This letter states:

"Within the territory north of the Ohio River and east of the Mississippi the railroad carriers are transporting the larger part of the interstate traffic at rates less than those shown in the published tariff filed with your commission, which are by statute the only lawful rates.

"While this condition continues there will exist the unjust discriminations and the unjust preferences and advantages between persons, localities, and particular descriptions of traffic, the prevention of which is the main object of the act of Congress establishing your commission. Only by securing the uniform charging of the published rates can the just equality of service and of charge required by law be secured either between persons or between localities."

The letter goes on to say that such discriminations and secret rates have been to some extent checked by joint associations of railways. Since under the decision of the Supreme Court of the United States joint associations and agreements are held illegal, the railway company applies to the Interstate Commerce Commission to vigorously enforce the law, and agrees to cooperate with the commission in so doing, both by itself maintaining published rates and by giving information concerning violations of the law by other common carriers. (637, 638.)

Referring to the above letter of Receivers Cowen and Murray, Mr. PAGE denies that the Standard Oil Company has ever received any rebates or advantages from the Baltimore and Ohio Railroad since the interstate-commerce act. (770.)

2. *General denial.*—Mr. ARCHBOLD, vice-president of the Standard Oil Company, replying to Mr. Lee's testimony, denies that the Standard Oil Company has received rebates of any sort from railway companies since the passage of the interstate-commerce act in 1887. The only case specifically referred to by Mr. Lee goes back to 1889 and was not strictly a case showing discriminations in favor of the Standard Oil Company, but rather discriminations, so called, in favor of tank shippers as compared with barrel shippers of oil. (Compare p. .)

The Standard Oil Company has sought to uphold the interstate-commerce act in every way, and is decidedly in favor of that act. It is possible that railways have since the law was passed offered rebates to the Standard Oil Company, but if so it has always refused and will continue to refuse to accept them. The witness submitted letters from officers of the leading railways of various sections of the country in reply to a circular inquiry sent out by the Standard Oil Company,

asking whether the respective roads had granted any advantages to that company, "either by direct tariff, rebate, underbilling, or in any other way." These letters each specifically deny that any such preferences have been given to the Standard Oil Company, and many of them further state that the Standard Oil Company has used its influence with the railways to maintain agreed tariff rates and to support the interstate-commerce act. The letters referred to are from the following railways: Atchison, Topeka and Santa Fe; Baltimore and Ohio; Boston and Maine; Chicago and Alton; Chicago, Milwaukee and St. Paul; Chicago, Burlington and Quincy; Cleveland, Cincinnati, Chicago and St. Louis; Delaware, Lackawanna and Western; Erie Railroad; Great Northern; Lake Shore and Michigan Southern; Louisville and Nashville; New York Central and Hudson River; Northern Pacific; Pennsylvania Railroad; St. Louis and San Francisco; Southern Pacific; Southern Railway; Union Pacific; Wabash Railroad; Western New York and Pennsylvania. (515-528, 580.)

Mr. ARCHBOLD further states that it is suspected that the competitors of the Standard receive some advantages and special rates. He refers also to the low rates received by the United States Pipe Line on rail shipments in New Jersey.

Mr. PHILLIPS denies that the independent refineries receive any advantages or discriminations from the railways. The low rates received on oil from the terminus of its pipe line in New Jersey to New York are open rates, and in proportion to the rates from Oil City and other more distant shipping points. (601.)

On this subject see above, p. 104.

Mr. PAGE repeatedly makes the same assertion as Mr. Archbold, that the Standard has received absolutely no advantages from the railways since the passage of the interstate-commerce act, and asserts that in his position as an officer of the Union Tank Line Company he would be certain to know of any such discriminations. He asserts that it is impossible to doubt the truth of the statements made by the presidents and officers of the various railways whose letters on this subject are quoted by Mr. Archbold. He adds that the reasons why the Standard has not received and asked for rebates, in spite of the well-known fact that some large shippers have received such advantages since the passage of the interstate-commerce act, are, first, because to do so would be against the law, and secondly, because the company knows from past experience that if it receives cut rates on oil shipments, other oil shippers will do the same. (778, 786, 787.)

Mr. Page likewise comments upon the fact that the opponents of the combination, notwithstanding their active efforts to prove violations of law, have during more than 12 years been able to bring forward only one case, which is explained as being a clerical error (see pp. 165-167). It would have been impossible, in view of the immense number of railway employees, to keep rebates and discriminations secret. (778.)

In further refutation of the general evidence as to the importance of discriminations in favor of the Standard Oil Company, Mr. Page submitted evidence to show that the total tonnage of oil moved by the railroads of the United States is less than one-half of 1 per cent of the entire annual tonnage. (786.)

Mr. ROCKEFELLER, in an affidavit submitted to the commission, made the following statement on this subject:

"7. Q. Has the Standard Oil Company received any financial favors from any railroad since 1887?—A. To my knowledge, none whatever.

"8. Q. Has the ownership of stock in railroad companies by officers of the Standard Oil Company given the Standard advantages with those railroads over its competitors? If so, give particulars.—A. It has not. Stockholders and officers of the Standard have invested in stock of railway companies. But in no instance have they done so for the purpose of influencing the policy of the railway companies, nor to the best of my knowledge and belief has any attempt ever been made through such ownership to influence any railway in favor of the Standard." (795, 796.)

3. *Rejoinder*.—In view of the statements of numerous railway officers that no discriminations have been granted to the Standard by their roads, Mr. EMERY declares that these higher officers may perhaps be ignorant of the existence of discriminations which are actually made. He would desire to have the auditors and bookkeepers compelled to testify and the books of the companies brought into court. In the case below referred to against the Pennsylvania Railroad (p. 161) information of rebates was secured in this way, when the president and general freight agent of the road had sworn that none had been paid. The witness believes that that company would have paid almost any sum to prevent its books from being examined by the courts.

Mr. Emery believes that railway discriminations are responsible for the oppressive monopolies which exist in almost every line of business; that but for them

there would have been no trusts. He refers to the excessive prices of coal in the northwest as showing a combination in that business. (648.)

Referring to the above series of letters from railway managers, Mr. RICE declares his belief that the Southern Railway Company, at any rate, actually does indulge in freight discriminations, such as are charged by Receivers Cowen and Murray of the Baltimore and Ohio Railroad. (747.)

B. Logan, Emery & Weaver Case.—Mr. EMERY states that the case of Logan, Emery & Weaver v. The Pennsylvania Railroad Company was brought in 1887, but was continued until 1890, largely through the delays of the railway. The president of the Pennsylvania Railroad, and its general freight agent, testified in 1890 that positively no rebates had been paid, at least since 1887. But the auditor and assistant auditor of the road, as well as a bookkeeper who had been employed in keeping the accounts of one department for 26 years, testified that rebates of from 8 to 28 cents per barrel had been granted since 1887. Mr. Emery also quotes the testimony of B. B. Campbell in this suit, showing that the Bear Creek Oil Refining Company, with which Mr. Campbell was connected, had received rebates on shipments from Coleman Station to Philadelphia, Communipaw, and Bolivar, from October 1, 1884, to July 1, 1888, a year and a half of this time being after the passage of the interstate-commerce act. The total amount of rebates received was \$48,101. After long delay and difficulty the court issued an order requiring the Pennsylvania Railroad to produce its books, and these were actually brought to the place of trial. They were, however, never examined. The witness believes that they would have incriminated the officers of the company, and that it would have been willing to pay a very large sum to escape showing them. The attorney of the railroad accordingly approached the plaintiffs and offered to settle the case. Mr. Emery's partners were very much discouraged and disgusted, and were too poor to carry the suit further. They feared that the railway company would succeed in continuing its dilatory methods and piling up the expenses of the case. Accordingly the proposed settlement was finally accepted, the railway paying \$35,000 and the expenses of the suit. It does not appear that the Standard Oil Company was concerned in this case. (633-635-669.)

The above evidence was confirmed in its general outlines by Mr. LEE, who was attorney in the suit. (287.)

C. Favorable rates from Standard shipping points.—1. *General statements.*—Considerable evidence was also presented to show that the Standard receives peculiar advantages in the way of lower freight rates from its large shipping points than prevail from points where its competitors make most of their shipments. The representatives of the Standard Oil Company state that the only advantage enjoyed by the combination results from the location of its refineries at places nearer to the point of consumption. The large number of refineries owned by the Standard in different places makes the average distance which it must ship less than that of the independent refiners having a single establishment. So far as rates per mile are sometimes less from one point than from another, this is a common practice among railways, depending upon the amount of shipments.

Thus Mr. PAGE testifies as follows:

"Commissioner Prouty's arguments seem to be to the effect that the Standard Oil Company had advantages by reason of having its refineries and distributing plants at Chicago and the Atlantic seaboard, as well as at Lima, Buffalo, and other middle-State points, as compared with a refiner who had his works only at Cleveland or in the Pennsylvania oil regions. We admit that by having refineries and distributing plants at Chicago for the West, at Buffalo, Lima, and Parkersburg for the Middle States and the South, and at the Atlantic seaboard for the East and New England, we have decided advantages over a refiner who has his works only at one point, and who tries to compete with us in selling oil throughout the country. We claim, however, that such an advantage is a fair one, and can not be overcome by any fair or reasonable adjustment of freight rates. We further claim that by having our refineries and distributing plants located at various points throughout the country we can and do distribute more cheaply and sell the oil at a less cost to the consumer, and it is more to the interests of the country at large for the consumer of oil to get it at a low cost than it is to try to fix freight rates on any basis that will permit one manufacturer at one point to distribute his products throughout the United States."

Mr. Page adds that the rates on oil from different points in the Pennsylvania field are made on a uniform basis, and similarly from the Ohio field, so that there is no difference in favor of the Standard as regards places really similarly situated. (770, 778, 788.)

Mr. LEE and Mr. MONNETT testify that independent shippers are especially benefited where water transportation can be secured in competition with rail-

transportation. The latter witness points out, for example, that the rates to New Orleans from Northern shipping points are lower than to places 150 miles north of there. Compare on this subject the evidence as to differences in rates for short and long hauls. (Lee, 269; Monnett, 316.)

2. *Whiting rates.*—Mr. MONNETT testifies that the Standard Oil Company gets an advantage over its competitors by securing lower rates from points where it has refineries than are made from points where competing refineries exist. Thus it has transferred most of the business of its Cleveland branch to Whiting, Ind. The freight rate to New Orleans from there is 23 cents per barrel, as against 33 cents from Cleveland, and this injures severely the competing company of Scofield, Shurmer & Teagle. (309.)

Mr. WESTGATE states that formerly the rate on oil from Titusville to the Pacific coast was 78½ cents per 100 pounds, but since the Standard Oil Company established its new refinery at Whiting, an added rate of 17½ cents to Chicago has been made, the rate from Chicago remaining 78½ cents. (376.)

As regards this difference in rates to the South alleged to exist between shipments from Cleveland and those from Whiting, Mr. PAGE states that Whiting is considerably nearer to New Orleans than Cleveland. On its being pointed out that there is a greater difference between the respective rates in the case of petroleum products than in the case of linseed oil, Mr. Page states that railways adjust their rates from different points according to the amount of traffic and to other conditions. Chicago is naturally a large shipping point for linseed oil, and the traffic can bear a higher relative rate from there than it can from Cleveland. The Standard Oil Company has located its refinery at Whiting because it is nearer the great West, which is a large consumer of oil. The company thus has an advantage over those shipping to the West from more eastern points. (777, 778. It should be borne in mind that the Standard transports crude oil from Ohio fields to Whiting by means of pipe lines.)

3. *New York and New England.*—Mr. WESTGATE states that he formerly shipped oil to various points in eastern New York and New England at the regular carload rate for Boston and so-called Boston points, but recently the through rates to numerous places have been withdrawn from this adjustment and local and arbitrary rates on oil, different from those on other commodities, added to the through rate. The Red Line rate to Boston from Buffalo is 23½ cents per hundred on oil, but to various other places in Massachusetts the rate has been made 33 cents. The witness is practically excluded from such cities as New Haven and Providence, and from Vermont points. A recent circular of the Red Line states that oils on the Central Vermont Railroad and the New York, New Haven and Hartford Railroad can not be taken at the rates named in the regular tariff, but are subject to arbitrary rates. The rate on oil to Burlington, Vt., in 1895, as quoted by the Lake Shore Railroad, was 44½ cents; to St. Johnsbury, Vt., 36½ cents; to Newport, Vt., 38½ cents per 100 pounds. The two last-named stations are entered in the Red Line traffic book as taking Boston rates, which are 23½ cents.

On April 12, 1899, the general agent of the Green Line system wrote to the witness that the Delaware and Hudson had ordered that on shipments from Whitehall, N. Y., to various points in New England and New York, named in the list, additions of from 5 cents to 14 cents per barrel must be made to the Boston rate of 23½ cents from Titusville. The agent called the attention of the railroad to the fact that these rates amounted to about 2½ cents per ton per mile, but no change was made save to add certain other stations (between Saratoga and Northcreek), which should bear rates of from 6 to 18 cents in addition to the Boston rate.

The witness, in fact, has found that the railways do not appear to wish to handle independent oil. Very few agents solicit oil trade as they do other kinds of freight business. The commercial agent of the New York, Chicago, and St. Louis Railroad writes under date of April 12, 1898, that the road can not name satisfactory rates on oil from Titusville to Vermont. The manager of the New York Central Fast Freight Line (Red Line, White Line, Blue Line, etc.) writes, December 5, 1898, that oil is not a commodity which they are allowed to handle on fast freight lines. The witness considers oil somewhat more dangerous to handle than other freight, but very little. (373, 378.)

The difficulty as to railway rates on oil, in Mr. Westgate's opinion, appears to be largely that arbitrary rates are fixed to different places at the will of the railways, apparently with a view to favoring shipments by the Standard Oil Company. Rates are higher from places where the independent refiners do their manufacturing and shipping than from those where the Standard Oil Company is located. The witness believes that oil should be classified as sixth-class freight or, at any rate, as fifth class, and should bear the regular tariff rates prescribed for other goods of the same class. (379.)

Mr. ARCHBOLD disclaims all knowledge of recent changes in freight rates in New York State or elsewhere, such as are referred to by Mr. Westgate. He doubts exceedingly whether any have occurred recently, nor does he know of any rates which work peculiar disadvantage to the competitors of the Standard Oil Company. (573.)

Regarding the statements of Mr. Westgate, Mr. PAGE testifies that the Standard makes East Boston a main distributing point for a large section of New England, shipping oil from there as far as to Portland on the north and Newport on the south. This station is supplied partly by rail and partly by steamer shipments from the company's refineries at the seaboard near New York and Philadelphia. The Standard Oil Company also ships to some extent from the Pennsylvania oil region to New England, and in so doing pays precisely the same rate as others. It is not denied that by having refineries located on the seaboard the Standard has an advantage in supplying oil to New England over competitors having refineries in Cleveland or in the oil region, but under no fair adjustment of rates could these more distant refineries be placed on an equality.

As to the reason of the railways for refusing to make a through rate on oil from the West to New England points, so that the rates to Newport and other places are much higher than to Boston, Mr. Page testifies that the railways have their own methods of fixing through rates. In some cases they make through rates, while in others they charge local rates to different points in addition to the through rates to the central points. These adjustments depend upon the amount of freight shipped and on other causes. The witness particularly denies that Mr. William Rockefeller has ever influenced the rates on the New York and New Haven Railroad. (770, 776.)

4. *Advantage of Standard in shipments in and to Canada.*—Mr. GALL, a wholesale dealer in petroleum products at Montreal, testifies that shortly after the Standard Oil Company in 1898 purchased all of the existing refineries in Canada, the through freight rates on oil over the Canadian Pacific and the Grand Trunk from American points to Montreal were nearly doubled, the purpose being, as he believes, to favor the Standard Oil Company in its business, since that company was refining oil in Canada and did not have to pay these high rates. The rate in April, 1898, from Warren, Pa., to Montreal was 23½ cents. At present it is 48½ cents, and this change has been due entirely to the increase in rates on the Canadian roads, the rate from Warren to Buffalo being still 8½ cents. The rate from Toledo was formerly 29½ cents but has been raised to 46½ cents per barrel. Owing to these increases in the freight it is impossible in Canada to sell at a profit even Ohio oil, which costs at Toledo only from 3 to 5 cents per gallon, at 17 cents per gallon, which is the price now fixed by the Standard Oil Company for Canadian oil, the latter being scarcely equal in quality to Ohio oil.

The company with which Mr. Gall is connected, together with the Sun Oil Refining Company of Hamilton, made complaint before the railroad committee of the privy council of Canada in June, 1899, concerning these excessive charges, and also concerning the discrimination which then existed on local shipments between Canadian oil and American oil.

At that time the railways were in the habit of demanding from shippers a statement whether oil was American or Canadian. In shipping from Montreal to St. Johns the witness has paid \$1.08 per barrel on American oil and 54 cents on Canadian oil. The original bills of lading were submitted in evidence. This discrimination has been acknowledged by the railways and has been stopped.

The rates referred to from Buffalo to Montreal, 35 cents per 100 pounds, are much higher than those from Sarnia to Montreal, on the same class of goods, although the distance from Sarnia is 77 miles greater. The Standard Oil Company has large refining works at Sarnia. The rate from Buffalo and Suspension Bridge to Montreal is 35 cents, that from Sarnia to Montreal 25 cents per 100 pounds.

The witness also believes that secret rates are made to the Standard Oil Company on its shipments of American oil, much lower than the open rates. He has made this charge before the railway committee, but is unable to submit definite evidence in support of it as yet.

The witness believes that the increase of rates referred to was made at the instigation of the Standard Oil Company. For some time before the increase it was impossible for the independent shippers to ascertain what the proposed rates would be. The Standard Oil Company made very large shipments to Canada immediately before the higher rates went into effect. The witness believes that it had knowledge of the change that was to be made.

The Michigan Central Railway, as the witness has been informed by one of its officers, refused to increase freight rates when other roads did so, and the result is that the Standard Oil Company has taken away all its freight from the Michigan Central.

The Standard Oil Company is also shipping oil to Canada by vessel from New York, as well as transporting oil from Sarnia to Montreal by water.

The witness does not believe that this action of the railways is in any sense due to political influence, or to a desire to discriminate against the United States generally, although it has been the case in the past that Canada-owned railways, partly with the sanction of the government, have discriminated in various ways against the American shipper. (675-678, 682-685.)

Mr. WESTGATE, an independent refiner at Titusville, testifies that when the rate on oil from Buffalo to Montreal was advanced from 23 cents to 35 cents per 100 pounds he sought to obtain a rate on the New York Central to Adirondack Junction, 9 miles from Montreal, with a view to having his oil switched the remaining distance. But the New York Central made its rate to that point 35 cents also. This would amount to 1.65 cents per ton per mile, while the average rate per ton per mile on oil is about 73 cents. The witness is thus practically shut out from the Montreal market. (375, 378.)

As to freight rates to Canada, Mr. ARCHBOLD does not believe that there are any discriminations in favor of the Standard Oil Company. The advance in rates recently made on American oil from Buffalo to Detroit over the Canadian roads was in the interest of those roads and injurious to the Standard itself, since that company pays these rates in full and ships over 75 per cent of the American oil consumed in Canada. He knows of no rates that are not open to all comers. (572, 575; compare Rogers, 582.)

Mr. PAGE confirms this statement, but adds that he does not know the proportion of the shipments by the Standard from this country as compared with the oil it manufactures in Canada, but does know that its shipments from the United States were greater last year after the advance in rates than before. (788.)

D. Short and long haul.—Mr. RICE submitted statements concerning a large number of discriminations existing at the present time between rates to terminal points and to intermediate points, especially on the shipment of oil. These rates are taken from the public tariffs of the respective railways. All of them refer to shipments over Western and Southern railways. Among other discriminations mentioned are the following: Over the Union Pacific from Chicago to San Francisco the rate on oil is 78½ cents per 100 pounds, while the highest intermediate rate, to Humboldt, Nev., is \$1.75, or a charge 122 per cent higher for a haul 325 miles less. This difference applies to oil only, whereas on other commodities of the fifth class, in which oil belongs, the greatest difference between the charge for the full distance and the intermediate distance is only 12 per cent. From St. Louis to Galveston, Tex., over the St. Louis, Iron Mountain and Southern Railway, the tariff rate on oil is 33½ cents, while the rate to Aldine, Tex., is 55 cents, or 64 per cent more for a haul 63 miles less. The greatest discrimination shown is over the Louisville and Nashville Railroad. From Louisville to Mobile the tariff rate is 18 cents per 100, while to Flomaton, an intermediate point, it is 56 cents, making 211 per cent higher charge for 61 miles less haul. Mr. Rice declares that on the Southern roads there is no difference in the charge in favor of terminal as against intermediate points on other classes of commodities, but only on oil. (736-738.)

Mr. Rice testifies further that he proved in his suits that the Southwestern railways have allowed the Standard Oil combination stop-over privileges for its cars, billed to the terminal points, by which means part of the oil in a tank can be unloaded at the high-rate intermediate points. According to a letter from the Interstate Commerce Commission, dated July 12, 1897, this stop-over privilege was still allowed at that time. (718.)

E. Railway rates and pipe lines.—Several witnesses declared that the Standard Oil combination still has a great advantage from the fact that it transports crude oil from the producing regions to its refineries on the seaboard and at Whiting, Ind., by means of pipe lines. The cost of transportation is believed by these witnesses not to exceed from 5 to 8 cents per barrel (p. 106,) while the public charge of the pipe lines for transportation is several times that amount, being about the same as the railway rates, which are believed to be fixed largely by agreements with the pipe line companies. For evidence as to the earlier arrangements with the railways, which the witnesses believe to exist still, see above. (Pp. 149, 150; also MONNETT, 322, 323, as to present advantages.)

Mr. DAVIS states that he has sought to transport oil from wells controlled by him in the Corning field to Marietta, where he was interested in a refinery. The charge made by the pipe-line company was 35 cents per barrel, and after long delay in securing a reply to his telegram the Toledo and Ohio Central Railroad made a rate of 35 or 36 cents per barrel, which was practically prohibitive. (358.)

F. Underbilling of cars.—1. *Generally.*—It is charged by opponents of the Standard combination that it is favored in certain cases by having the weight of the contents of its tank cars underbilled. This charge is denied specifically with regard

to interstate shipments by representatives of the Standard Oil Company, and the instances where such underbilling has occurred are explained as occasional errors. The evidence is not so clear as to underbilling of tank cars in shipments within the State.

Mr. RICE expresses the belief that there is a certain amount of underbilling of weight in the case of all tank-car shipments, owing to the fact that the weight per gallon is estimated at 6.4 pounds. The standard weight of illuminating oil is not less than 6.7 pounds, so that the underbilling is 4.08 per cent. Lubricating oils are billed at 6½ pounds per gallon, but this is sometimes as much as 15 per cent less than the actual weight. (732.)

Mr. PAGE explains the reason for the adoption of the standard of 6.4 pounds per gallon. It applies to all petroleum products, including the lightest, such as gasoline. The different products range from 5½ to 7½ pounds per gallon, but 6.4 pounds has been found by careful investigation to represent the actual average on the basis of the amounts shipped. This method of calculating an average weight for the contents of tank cars saves an immense amount of difficulty to shippers and railways. To actually weigh cars in each case, or to test the exact weight of the contents per gallon, would involve great effort. (766.)

2. *New York case.*—Mr. WESTGATE testifies that he has seen within the past 3 or 4 years freight receipts for oil billed from Olean, N. Y., at the rate of 24,000 pounds for cars containing 7,000 to 7,200 gallons. The weight of oil is 6.4 pounds per gallon, which would make the real weight of these cars 44,800 or 46,080 pounds. The Standard Oil Company prepays the freight, apparently with a view to concealing these underweights. The witness is of the opinion that every car shipped from the refineries is billed on this basis. In another instance he heard of a person who bought crude oil from the Standard, and received freight bills at the rate of 24,000 pounds for cars containing 6,000 to 6,600 gallons, but who afterwards received a corrected bill at the actual weight. This underbilling was not an ordinary error. The witness himself is compelled to pay on the full weight, which makes his charges 50 to 100 per cent more. (373.)

Mr. ARCHBOLD absolutely denies that the Standard Oil Company has any arrangement with railways with reference to underbilling of tank cars, as charged by Mr. Westgate. He submitted to the Commission a book known as the "Tank Gauge Handbook," giving the number and the full capacity of every car used. This book is in the hands of all railways, and is the basis for billing oil. The witness also submitted letters from the general freight agents of the Western New York and Pennsylvania Railway and the Erie Railroad, the only roads reaching Olean, N. Y., each denying positively that any arrangement for underbilling cars exists, and stating that on the contrary freight has been charged and collected on the basis of the maximum number of barrels each tank could contain at an estimated weight, formerly 6.3 pounds per gallon, but later 6.4. (550, 551.)

Mr. PAGE likewise testifies as to the impossibility of underbilling tank cars. The railways charge freight on the capacity of the tank car, no matter whether it is loaded to full capacity or not. The weight is estimated on the basis of 6.4 pounds per gallon, whatever be the actual weight per gallon of the contents. (766-770.)

3. *New York, New Haven and Hartford case.*—Mr. RICE refers to the evidence in a suit before the Interstate Commerce Commission in 1897 to show that in that year two cars of naphtha, containing 100,986 pounds actual weight, shipped from East Boston to Newport, R. I., were charged at a weight of 48,000 pounds by the New York, New Haven and Hartford Railroad, in which Mr. William Rockefeller is a director. He states that Mr. Page explained that this was due to a clerical error and paid the balance due, but Mr. Rice believes that a similar discrimination has existed in regard to all shipments, this single case only having accidentally come to light. (731, 732.)

Mr. PAGE takes up this case in detail. He submitted a letter from Mr. Hall, the vice-president of the New York, New Haven and Hartford Railroad, to the Interstate Commerce Commission, stating all shipments made over that road from East Boston to Newport from April 6, 1896, to December 6, 1897. On three separate occasions two or three cars were received by that company from the Boston and Albany Railway billed at a weight of 24,000 pounds each. The weight thus given was accepted through the error of the agent of the New Haven road, and without any misrepresentation on the part of the shipper. The errors were subsequently discovered and the difference in freight collected.

Mr. Page explains the reason for the billing of the oil at 24,000 pounds by the Boston and Albany as follows: "Our works are located at East Boston on the Boston and Albany road. The Boston and Albany road have to switch any car from Boston to East Boston, where the cars are delivered to the New Haven

road. That switching charge, as I recall it, is \$6 per car; either \$4 or \$6 per car. The Boston and Albany road, like many other roads, wishes to show its tonnage, whether the rates are per car or per 100 pounds; and where the rate is per car, as in this instance, it probably uses 24,000 pounds, which is the usual carload weight; it is the minimum carload weight. They simply put in 24,000 pounds. The testimony shows, and I swear now, that we did not give the Boston and Albany road 24,000 pounds as the weight of those cars, nor did we give them any weight. We did notify, not only directly, but through this book, the actual weight of all those cars, and it was simply an error of the New Haven road, as shown in the testimony, and as offered by Vice-President Hall, that the New Haven road took in error the constructive weight of the Boston and Albany in their bill, instead of taking the actual weight, which they had in their power to get, and should have got."

As to whether it was the general custom of the Boston and Albany to bill cars at this minimum rate of 24,000 pounds to other stations, Mr. Page declares that he does not know. If this be the case, the Standard nevertheless pays the same rate as all other shippers.

Mr. Page also submitted extracts from the testimony before the Interstate Commerce Commission in its investigation of these cases, and further extracts are quoted in a footnote. Mr. Kidder, agent of the Boston and Albany Railroad at East Boston, stated that the receipts furnished by the Standard Oil Company regularly contained no statement as to weights, and that it was the ordinary custom to ship tank cars of naphtha at the minimum weight of 24,000 pounds to all local points. The witness had never before seen a copy of the "Tank Gauge Handbook," containing the capacity of tank cars.

Mr. Keyes and Mr. Davis, employees in the freight department of the New York, New Haven and Hartford road at Boston, testified that they had no copy of the "Tank Gauge Handbook" in their office. It was the custom to bill tank cars at the weight named in the waybill of the Boston and Albany unless instructions to the contrary were received. Such instructions were, however, sent by letter from the Standard Oil Company in almost every case, stating the weight of the oil.

Mr. Winlock, assistant general freight agent of the New Haven road, testified before the Interstate Commerce Commission confirming the statements of Mr. Keyes and Mr. Davis. He submitted a letter from the Standard Oil Company, dated February 9, 1897, stating the actual weight of two cars, which had been billed by the railroad at 24,000 pounds, this letter having been overlooked by the clerks in the office. Mr. Winlock further stated that the agents of the road billed tank cars at their actual weight in the case of interstate shipments, but was not prepared to answer the question as to whether a different rule was followed for shipments within the State. It is not clear whether the inability to answer is due to ignorance or to unwillingness. Mr. Winlock specifically denied, however, that there was any understanding with the Standard Oil Company by which cars were billed within the State at less than actual weight. Extracts from this testimony before the Interstate Commerce Commission follow:

"Q. You are the man who would know about that rule, if there was any?—A. I have already said that I think it is the same. I am not absolutely positive of the different rates which apply on interstate business.

"Q. I am not talking about rates; I am talking about a rule as to the billing of these cars, and my question is this: When you bill a tank car to an interstate point—a point without the State of Massachusetts—do you bill it at its actual weight; and when you bill a car to a point in the State of Massachusetts do you bill it at a weight of 24,000 pounds?—A. That is a question that I could not answer.

"Q. Do you mean to say that you have no knowledge about it?—A. No, sir.

"Q. You mean you don't want to answer that question?—A. I mean I don't want to answer that question.

"Q. (By Mr. PAGE.) You have no understanding with the Standard Oil Company, or any instructions from your superiors, by which you are to bill cars within the State at less than the actual rate?—A. None whatever.

"The COMMISSIONER. Not the actual rate?

"Q. At less than the actual weight. You have no understanding with us by which you should bill cars at 24,000 pounds within the State because of our interstate shipments, have you, or for any reason?—A. We have no instructions from you—

"Q. Or understanding with us?—A. We have no understanding with you at all, Mr. Page, of any kind.

"Q. In other words, Mr. Winlock, the rates that you may name us within the State have no connection or no bearing in regard to interstate business?—A. None whatever." (Pages 770-775.)

G. Tank and barrel shipments.—Much testimony was presented to show that great advantages had been formerly given to shippers of oil in tank cars as compared with those using barrels, and that some differences in this regard still exist. (See, e. g., Lockwood, 888.) It is admitted by some that all tank-car shippers enjoy equal advantages, but it is urged that the Standard Oil Company controls most of the tank cars.

1. Early difference in rates per hundredweight.—Prior to 1888 it was customary, if not universal, that lower rates per 100 pounds should be charged for freight on oil in tanks than in barrels.

Mr. RICE believes that the higher rates on oil in barrels which formerly existed were made at the instance of the Standard Oil Company, and not because of any preference of the railroads for tank-car shipments. Up to 1888, he states, the Pennsylvania Railroad carried oil in barrels, including the package, for the same rate per gallon as in tank cars, but afterwards changed so as to require the shipper to pay for the weight of the package. (716.)

Mr. Rice declares further that he has proved gross discriminations, exclusively in favor of the Standard Oil Trust, by the Southwestern railroads since the adoption of the interstate-commerce act. Although he does not make this point clear, many of these discriminations were apparently between tank-car shipments and barrel shipments, and no specific evidence is submitted to show that the tank-car rates made to the Standard Oil Company were not open to the general public. Mr. Rice submitted tables showing the difference in mills per gallon charged to the Standard Oil Trust and to himself for shipments over the Louisville and Nashville Railroad from Louisville and Cincinnati to various southern points. The percentage of difference between these rates ranges from 66½ to 883 per cent. Similar tables as to the rates over the Cincinnati, New Orleans, and Texas Pacific, Newport News and Mississippi Valley, and St. Louis and Iron Mountain roads show differences ranging from 40 to 267 per cent. These differences were proved to exist up to April 1, 1888, and despite an order of the Interstate Commerce Commission, the Missouri Pacific Railroad was still carrying tank cars by lump sum on May 28, 1888.

Mr. Rice states that he proved that in November, 1887, 7 or 8 months after the interstate-commerce act took effect, he was paying on barrel shipments of oil from Cincinnati to Birmingham, Ala., four times as much freight as the Standard Oil Company was paying on tank-car shipments. He was paying 59 cents per 100 pounds on 400 pounds to the barrel, amounting to \$2.36; while the Standard only paid 16.8 cents per 100 on 315 pounds, amounting to 52.9 cents per barrel. The discrimination was 346 per cent. (711, 714, 715, 749.)

Mr. PAGE admits the difference which existed, after the passage of the interstate-commerce act, between the rates on oil in tank cars and in barrels. This was not a discrimination between individuals, since rates in each case were published and open to all. The Interstate Commerce Commission, in 1888, ordered that the rates per 100 pounds on oil in tank cars and in barrels should be the same, the weight of the barrels being included in the weight charged upon. The railroads accordingly adjusted their tariffs in this way, and they still remain on that basis. The Standard Oil Company was at that time, as the witness believes, shipping more oil in barrels than in tank cars, so that it was injured as much as its competitors. (765.)

This decision of the Interstate Commerce Commission in 1888 is also referred to incidentally by other witnesses.

2. Charge for weight of barrel.—Two or three witnesses opposed to the Standard combination refer to the fact that discriminations in favor of the Standard have been proved, since 1888, before the Interstate Commerce Commission, which has ordered damages to be paid to the shippers injured. It appears from the evidence of these same witnesses, however, and still more clearly from the evidence of Mr. Archbold and Mr. Page, that the case referred to is one of difference in charges between tank shipments and barrel shipments.

The railways complied generally with the order of the Interstate Commerce Commission of 1888, above referred to. Later on, the independent refiners of Pennsylvania secured an order from the commission that the weight of barrels should be disregarded in charging for shipments of oil. The railways have not complied with this order or paid the damages assessed on account of the charge made for the weight of barrels. (LEE, 287; WESTGATE, 379; ARCHBOLD, 614; EMERY, 686.)

Mr. PAGE explains precisely the status of the suits before the Interstate Commerce Commission as to barrel shipments. Several years ago the commission made an additional decision that the weight of the barrels must not be included, but should be carried by the railroad free. This order the railroads refused to obey, and they also refused to pay the damages which were assessed by the commission later on account of the charge made for the weight of the barrels. The case is now pending before the United States court in Pittsburgh.

Mr. Page adds that a large proportion of the oil shipped by the Standard Oil Company is transferred from tank cars to barrels at distributing stations and shipped in that way to local points, so that the Standard is subject to these charges upon the weight of the barrels the same as other shippers.

Mr. PAGE and Mr. ARCHBOLD further testified that the Standard Oil Company itself will have a large claim for repayment by the railways of the freight paid upon barrels, if the above decision is sustained by the courts. Mr. Archbold, however, declares that he considers the requirement that barrels be carried free to be unjust. (Archbold, 516; Page, 788, 789.)

Mr. RICE brought in 1889 complaints before the Interstate Commerce Commission concerning the Southwestern railroads, raising questions as to the like classification of barrel and tank oils, the charge for the weight of the package, the return of tank cars free, and the existence of lower rates on cotton-seed oil in tank cars than on petroleum, the latter, which were proved to exist, constituting an advantage to the owners of tank cars. These cases were never decided, being "held open for additional evidence." (715.)

3. *Relative advantages of tank cars and barrels.*—There was disagreement among the witnesses as to the question whether a relatively lower charge for oil in tank cars than for oil in barrels is justifiable. The relative advantages to the railways of the different methods of shipment were discussed.

Mr. PAGE declares, in the first place, that it is entirely fair at least to charge for the weight of the barrel, because it is itself a merchantable article and its value is added to the price of the oil sold, while the same is not true of the tank car.

It was pointed out by the opponents of the combination that tank cars are returned free of charge, while barrels are not. Tank cars must be returned empty, while the box cars used for barrels can contain a return cargo. To this Mr. Page replies that box cars used for oil can seldom be employed for other purposes, so that these also are usually returned empty, and free of charge.

Mr. Page testifies further that tank-car shipments are more economical generally to the railways. The average capacity of the tank car is 140 barrels, whereas it is seldom possible to carry more than 60 barrels in a box car. The tank car is universally loaded by the shipper and unloaded by the consignee, while the box car is very often unloaded by the railroad in its own depot. (767.)

Mr. RICE denies that it is an advantage to the railways to handle oil in tank cars. He quotes the evidence of John S. Wilson, general freight agent of the Pennsylvania Railroad, before the Interstate Commerce Commission in 1888. Mr. Wilson stated that oil in tank cars was exceedingly dangerous; that in case of collision or other accident the oil would catch fire and flow to great distances, while, on the other hand, the separate barrels can often be saved; and that the necessity of returning tank cars empty made them less economical than box cars for barrel shipments. Mr. Rice admits, however, that a tank car carries more oil than a box car, and saves the weight of barrels; but he believes that there is no advantage to the railways in the loading and unloading of tank cars, since barrels also are loaded and unloaded by the owners of the oil, not by the railways. (716, 717.)

On this point Mr. WESTGATE testifies that Mr. Motheral, a confidential officer of the Green Line in Oil City, stated in 1888, before the Interstate Commerce Commission, that for 5 years the loss on oil shipped in barrels had been twenty-seven thousandths of 1 per cent, while the loss in tanks was forty-three thousandths of 1 per cent. The risk on oil is somewhat greater than on ordinary freight, but the witness believes that it should be classified as sixth-class or at least fifth-class freight. (378, 379.)

4. *Mileage on tank cars.*—Mr. RICE declares that the 8,000 tank cars owned by the Standard Oil combination are paid for every 3 years by the mileage of three-fourths of a cent per mile each way, which is paid by the railways for the use of these cars. He admits that the same mileage is paid to other owners of tank cars, but states that the Standard has most of these cars. Box cars can be used to bring back other freight, but the railway pays for hauling the empty tank cars. (782.)

Mr. PAGE denies that the payment of three-fourths of a cent per mile by the railways to the Union Tank Line Company for the use of its tank cars is excessive, and also that the Tank Line Company is making extraordinary profits. The company receives no other payment whatever for the use of its cars than this mileage rate. It receives no commission from the Standard Oil Company and has no other sources of profit. Owing to the fact that the consumption of petroleum in the summer is small, a large part of the equipment of the company is earning nothing whatever during a considerable portion of the year. Moreover, the rate paid to this company by the railways is the same as is paid to the owners of other tank cars, of whom there are 170 or 180, holding an aggregate of 7,420 cars, as compared with the 5,851 owned by the Union Tank Line Company. As a matter of fact, since its formation, in 1891, the Union Tank Line Company has never paid a dividend, and the actual earnings have been only 4.5 per cent per annum on the investment. The company does not pay excessive salaries; hence this is not an explanation of its low profits. The business is continued because it is a necessary arm of the petroleum industry. The present owners of the Union Tank Line Company and of the Standard Oil Company are the same, and the Standard continues the business because it is the most economical way to handle oil. Probably the reason why the two corporations are kept separate is that the Union Tank Line Company is in a better position to run cars than the Standard Oil Company would be, since the latter is also doing a manufacturing and marketing business. (778-784.)

5. *Indirect advantages to tank shippers.*—In addition to lower rates, it is claimed that the Standard combination receives minor indirect privileges and advantages on its tank-car shipments.

Thus Mr. MONNETT states that the Union Tank Line Company receives an allowance from the railways for loading and unloading its own shipments, while the rates for shipment are very much lower in tanks or carload lots than in part carloads. This latter difference the railways justify on the ground that shipment of oil and gasoline contaminates other goods in the cars. (299.)

Mr. RICE also complains of the injustice of the difference between the charge for oil in tank cars and that for oil in less than car lots. (719.)

Mr. ARCHBOLD denies absolutely Mr. Monnett's statement that discriminations are made in favor of the Union Tank Line Company or the Standard Oil Company. "The rates fixed by the railroads in connection with tank-car lots and single-barrel or part-car lots have been the same to all, and carried with them no discrimination whatever in favor of the Standard Oil Company." (543.)

Mr. RICE further declares that up to March 15, 1890, the railways allowed a deduction of 62 gallons from the actual contents of each tank car, amounting to 1½ per cent of the shipments. From March 15, 1890, to September 1, 1892, this deduction was 43 gallons. Mr. Rice considers that there was no justification for this deduction. (716.)

Mr. PAGE explains the practice of allowing "outage" on tank-car shipments. It was found by actual experience that there was an average loss of weight, through leakage and otherwise, of about that amount during the transportation of a tank car of oil. It was not just that the shippers should pay freight on oil which was not actually delivered. The outage is allowed to all shippers, and constitutes no discrimination. (766.)

Mr. RICE declares that the Southwestern railways do an injustice by the rule that tanks containing petroleum, which are intended to be used for permanent oil stations, shall be transported at actual weight at the oil rate. The railway becomes the judge as to whether the tank car is intended for this purpose. (718.)

Mr. PAGE replies that this practice seems to be perfectly just, and if the railroads wished to discriminate in favor of the Standard Oil Company they would carry the tank free, as they do the regular tank car. (769.)

Mr. RICE testifies that the Central Freight Association also provides that tank cars will be received only when consigned to points where proper unloading and storage facilities exist. The railway is the judge as to the character of such facilities.

A further advantage was given in 1891 by the Southern Pacific Company in favor of shipments in a peculiar box tank car combination, exclusively owned by the Standard Oil Company under patent. (716-718.)

Mr. PAGE declares that the first rule above mentioned means simply that the railways will not allow a tank car to be unloaded in their depots or yards by improper methods, which might result in leakage or accident. The box tank cars referred to contain a space between the tanks which can be used for other loads. The transcontinental railroads charge for returning ordinary tank cars, but not for these, because they can be so used. (769.)

6. *Furnishing of tank cars by railways.*—Mr. RICE testifies that it is practically impossible for independent shippers of petroleum to secure tank cars from railways. If they use such cars they have to furnish them themselves at very considerable expense. The Standard Oil Company at an early day bought up all the tank cars from the railways, as the witness believes, with the understanding that the railroads should not build other cars. The witness has himself supplied some tank cars, but refers especially to the attempt on his part to secure certain cars from the Milton Car Works in 1887 on the installment plan of payment. This method, he declares, is the customary manner of paying for cars, but credit in this case was refused on the ground that the financial supporters of the car company had been unwilling to advance the money for the construction of the cars on account of some supposed controversy which they claimed to exist between the Standard Oil Company and the railroads on the one hand and Mr. Rice on the other.

Mr. Rice believes that all railways should own tank cars and furnish them to the shippers in the same manner as other cars. (711, 712.)

Mr. PAGE expresses the opinion that it would be a burden upon the railroads to require them to furnish tank cars to the shippers. The tank car is a special car for a special purpose, similar to the special cars used for numerous other kinds of shipments. The ownership of the tank cars would not insure to the railroads the transportation of oil, and if every road had a sufficient number of tank cars to handle all the business which sometimes passes over its lines, it would have to own many more than would ordinarily be employed. (765.)

H. *Indirect advantages of Standard.*—1. *Changes in rates for advantage of Standard Oil Combination.*—Mr. RICE submitted an extract from the Paint, Oil, and Drug Trade Review of January 25, 1893, containing a large number of telegrams and letters, written in November and December, 1888, between officers of the Southern Pacific Railroad and of the Transcontinental Association, on the one hand, and officers of the Standard Oil Company at New York and San Francisco, on the other.

The transcontinental freight rate was then 82½ cents. The railways proposed an increase. The officers of the Standard Oil Company desired to secure the continuance of low rates for the time being, until that company should be able to stock up on the Pacific coast, and that the rate should then be raised to \$1.25, with the arrangement that it should be again reduced, and thereafter changed from time to time, without public notice in advance, at the dictation of the Standard Oil Company. There was a considerable correspondence as to the amount of this lower rate which was to be maintained temporarily for the advantage of the Standard Oil Company, but it was finally fixed at 90 cents. The following extracts from the correspondence show that the railway companies made the agreement to shift the rates at the instance of the Standard Oil Company:

* SAN FRANCISCO, November 14, 1888.

W. SPROULE, San Francisco:

Say to Tilford that association will probably consent to following agreement: Oil rate from Cleveland to be \$1; at this rate he can stock up; after doing so he to notify Chairman Leeds, who, after giving necessary notice, will advance rate to \$1.25, and continue that rate until such time as Tilford notifies him of reduced stock, when he will again reduce it to \$1 to enable him to stock up.

J. C. STUBBS.

Personal.]

STANDARD OIL COMPANY,
San Francisco, December 4, 1888.

W. H. TILFORD, Esq.,

Vice-President Standard Oil Company, 26 Broadway, New York.

DEAR SIR: I will telegraph you this afternoon as per translated copy of message herewith attached, which is self-explanatory.

I herewith hand you a copy of a letter I have just received from Mr. Sproule, assistant general freight agent of the Southern Pacific Company, this city. This letter I interpret to mean the 90-cent rate is for us to stock up from time to time, and that the \$1.25 per 100 rate will be in effect whenever we may desire. This \$1.25 rate is what Mr. Sproule refers to in the latter portion of his letter, as my offer of 90 cents to Mr. Stubbs was on condition that he has the rate of \$1.25 put in effect when we might ask him. This letter also reads as if the 90-cent rate and \$1 rate was to be put in effect January 1. No doubt Mr. Stubbs was unaware that we were stocked up at the present rate of 82½.

The Transcontinental Association adjourned at Chicago yesterday, and I understand that Mr. Stubbs is now on his way home. I will see him on his arrival here,

and if Chairman Leeds, of the Transcontinental Association, has been notified to put the 90-cent rate in effect January 1, I will have the same corrected by wire and the \$1.25 rate put in. As soon as Mr. Stubbs reaches home I will telegraph you whether it is intended that the 90-cent rate should be put in effect January 1 or the \$1.25.

Yours, truly,

E. A. TILFORD.

SAN FRANCISCO, December 6, 1888.

J. C. STUBBS, *Chicago*:

If it is not already agreed upon that the \$1.25 rate is to go into effect January 1, on petroleum and its products from Cleveland and Pittsburg to the Pacific coast, will you kindly telegraph Chairman Leeds to put this rate in effect on the day mentioned. Please answer.

E. A. TILFORD.

Personal.]

SOUTHERN PACIFIC COMPANY,
OFFICE OF GENERAL FREIGHT AGENT,
San Francisco, December 8, 1888.

Mr. E. A. TILFORD,
President Standard Oil Company, City.

DEAR SIR: I beg to inform you that I am in receipt of advice that on January 1 the rate on petroleum oil and its products will be to \$1.25 per 100 pounds on car-load shipments from agreed Eastern points.

Yours, truly,

WM. SPROULE.

Mr. Sproule was assistant general freight agent of the Southern Pacific Company, Mr. Stubbs was general traffic agent of that company, and Messrs. W. H. Tilford and E. A. Tilford were officers of the Standard Oil Company.

Another letter shows that the Standard Oil Company had already, before the increase to \$1.25, on January 1, took place, secured a stock sufficient to last for 4 months.

Mr. Rice explains that these telegrams and letters were secured through an employee, either of one of the railways or of the Standard Oil Company, who had been discharged. (719-727.)

Mr. PAGE, on behalf of the Standard Oil Company, testifies that he knows nothing about the above correspondence, but that at least since March 2, 1891, the rates on oil from Eastern points to California have been absolutely unchanged. (769.)

2. *Exclusive shipment of Standard's oil.*—Mr. EMERY declares that it is still the practice of the Standard Oil Company to seek arrangements with railway companies by which they shall handle oil exclusively for the Standard, threatening that otherwise it will be forced to cut prices to meet competition to such a degree as to be unable to pay reasonable railway rates. It also seeks to make arrangements between competing roads for a division of the traffic, and for the exclusion of independent shippers. On account of such discriminations, and of the special cuts made by the Standard Oil Company in the markets sought by its competitors, Mr. Emery has found it impossible to ship oil to any considerable number of places in the United States, 70 per cent of his product going to Europe. The witness asserts that he could compete fairly with the Standard Oil Company if he could secure equal railroad rates. (630-633.)

3. *Control of terminal facilities.*—Mr. RICE declares, on the basis of testimony of officials of the Standard Oil Company, and of the railways, that the combination owns all terminal facilities for handling oil on four of the trunk lines from the oil regions to the seaboard. (698.)

Mr. LOOKWOOD also states that the railways during the 70's turned over the terminal facilities at New York to the Standard Oil Company, so that the independent refiners could not use tanks, but were forced to ship in barrels. (388.)

4. *Purchase of oil by railways.*—Mr. LEE believes, without positive knowledge, that while the Standard receives no direct rebates from railways, it is paid double prices for lubricating oils used by the roads, this constituting a form of discrimination in its favor. None of the leading railways buy lubricating oil of the independents. (368, 392; cf. MONNETT, 323.)

Mr. RICE also declares his belief, based only on hearsay, however, that the Standard Oil Company receives excessive prices for its lubricating oils sold to the railways. He quotes from the advertisement of the Galena Oil Company, a branch of the Standard Company, in which it is stated that Galena oils are used on nineteen-twentieths of the total railway mileage of America. (699, 700.)

Mr. DAVIS states that the refinery in which he was interested formerly supplied some lubricating oil to the Baltimore and Ohio Southwestern Railroad. The directors of that road bought stock in the Argan Refining Company. The witness's refinery has since found it impossible to sell oil to the railroad, no matter how much the price might be cut, although he has no direct knowledge that it prefers the Argan refinery. The railroad has considerable influence on dealers along its line, who can often get oil from it in small quantities. (359.)

Mr. CLARK states that while he was agent of the Standard Oil Company at Newark, Ohio, he furnished from 80 to 150 barrels of refined oil per month to the Baltimore and Ohio Railroad. The bills for the quantity were made out and sent to Columbus to have the prices fixed. The witness was allowed to have no direct dealings with the railway companies as to freights, handling of cars, etc. He did not sell lubricating oil to railroads. (347.)

Mr. PAGE denies that the Standard Oil Company is favored by railways in the purchase of lubricating oil. The Galena Oil Company is specially engaged in the manufacture of lubricating oil for railway purposes, and owing to the superior and uniform quality of its oils they are used on a large proportion of the railways. The company guarantees to the railways that the cost of lubrication per train mile, for a certain period of time, shall not exceed the cost of oils previously used; usually, in fact, it guarantees a reduction. The actual prices per gallon are higher than those of some low grades of oils, but as measured by lubricating power they are lower. The price is made the same to all railways, regardless of quantity, although the form of guaranty varies. Oil is usually sold to the railways under contracts for 3 or 5 years, and these contracts are naturally made by some central officer and not by purchasing agents of local divisions.

The Galena Oil Company does not sell largely to manufacturers or others than railways. So far as it does so it makes them the same price, but its oils are less fitted for that purpose.

The Galena Oil Company has increased its business tenfold since the interstate commerce act went into effect, which indicates that it did not secure its control of the railway business in connection with any system of rebates existing prior to that time. Independent producers still furnish considerable oil to railways. (756-759.)

5. *Excessive rates on oil-well supplies.*—Mr. LOCKWOOD submitted a receipted freight bill showing the charges on a carload shipment of oil-well supplies for a distance of 49 miles in Pennsylvania to be 5.95 cents per ton per mile. He has paid on shipments of 1 and 2 tons 13.57 cents per ton per mile. Statistics show that the average cost of moving freight in this country is 0.85 cent per mile. He is not aware that these rates were higher than those paid by other shippers. (391, 396.)

XI. RELATION OF THE PRESS TO THE COMBINATION.

A. *Subsidizing of Ohio papers.*—According to Mr. MONNETT, the Standard Oil Company of Ohio has organized what is known as the Jennings Publishing Advertising Agency, which distributes advertising for the company in various newspapers and makes contracts with them by which certain material defending the Standard Oil Company is published as news and editorial matter, but duly paid for. The company also purchases large numbers of newspapers containing such notices, thereby practically buying the support of the press. The following is a copy of part of a contract submitted in evidence in the Ohio suits against the Standard: "The publisher agrees to reprint, on news or editorial pages of said newspaper, such notices set in the body type of said paper and bearing no marks to indicate advertising as are furnished from time to time by said Jennings Agency, at the rate of — per line, and to furnish such agency extra copies of paper containing such notices at 4 cents per copy." The witness also exhibits an extract from the Lima Times-Democrat, which was published under such a contract. (312, 321.)

B. *Pittsburg papers.*—Mr. BOYLE testifies that none of the newspapers of Pittsburg give the same courtesy to the Standard Oil Company as to other interests. The Standard has at various times been viciously attacked by persons associated with the Producers' Protective Association, and has had to pay the newspapers advertising rates to secure the insertion of replies to the most outrageous lies. In the Derrick, which Mr. Boyle manages, both parties have been treated alike. (487.)

C. *Oil City Derrick.*—Mr. LOCKWOOD maintains that the Standard Oil Company has bought the Oil City Derrick and has hired a man (Mr. Boyle) to run it, but his assertion appears to be based primarily on the nature of the material published in the paper, which is bitterly opposed to independent movements. The

paper has been sued by Senator Lee and Senator Emery for libel. The Titusville Herald and the Pittsburg papers seem also to be under the control of the Standard Company, and publish what is furnished by it. (398.)

Mr. BOYLE, proprietor and publisher of the Oil City Derrick, testifies that the Standard Oil Company is not now and has not been for many years interested in that paper. The witness owns all the stock except four shares held to qualify the other directors. The paper is not, as is often assumed, an organ of the Standard Oil Company, but of the oil producers generally. Within the last 10 years there has been no occasion for adverse criticism of the Standard Oil Company, but there would have been such criticism if it had been called for. The paper is not opposed to all independent movements, but only to those involving unnecessary outlay of money and consequent taxation of producers. The duplication of pipe lines is, in the opinion of the witness, such an unnecessary outlay, as is shown by the fact that pipe lines established within the last 10 years have never paid dividends. The witness insists that he does not appear before the commission at the solicitation of the Standard Oil Company. (404, 405.)

Mr. BOYLE testifies further that fully half a dozen libel suits have been brought against him as editor of the Derrick, all by officers and members of the Producers' Protective Association. In two cases conviction was obtained, in two there was confession of judgment, and in one a failure to convict. These suits were all taken into another county where the people and the courts were prejudiced in favor of the Producers' Association. Mr. Boyle protests bitterly against the unfairness of the various trials. (487, 488.)

LIST OF WITNESSES.

	Page of testimony
Going, H. F., retired tin-can manufacturer	915-922
Graham, W. T., second vice-president of the American Tin Plate Company	849-863
Greer, George, district manager of the American Tin Plate Company for the New Castle district	922-930
Griffiths, William, independent tin-plate manufacturer, Washington, Pa.	887-915
Moore, William H., organizer of the American Tin Plate Company	959-967
Reid, Daniel G., president of the American Tin Plate Company	865-887
Taylor, Nathan A., independent tin-plate manufacturer	861-942
Wheeler, F. S., treasurer of the American Tin Plate Company	863-904

I. DESCRIPTION OF BUSINESS.

The manufacture of tin plate consists of the coating of a finely finished steel plate with tin or a mixture of tin and lead. The steel plate is known as a black plate, and the process of coating is known as tinning or dipping. The steel plates may be either of Bessemer steel or of open-hearth steel.

Many establishments manufacture black plates, but do no tinning while others, known as dipping establishments, manufacture no black plates but purchase them and coat them.

The most common grade or form of tin plate is that known as coke plate or canners' tin, which is used primarily for making tin cans. The basis of reckoning for prices and weights of such plates is a box containing 112 sheets, 14 by 20 inches. Such a box, if "full weight," contains 105½ pounds of steel and 2½ pounds of tin. The present basis of quotations in America is the 100-pound box, containing 97½ pounds of steel and 2½ pounds of tin.

There are also what are known as charcoal tin plates, of a higher quality, and often bearing a larger proportion of tin. Terne plates, which are chiefly used for roofing and are often referred to as roofing plates, are coated with a mixture of tin and lead. The prices of charcoal and of terne plate vary widely, according to the quality of the finish, and the weight of the coating. Regular market quotations refer to coke plate.

The word "mill," used in speaking of tin-plate manufacture, refers not to the entire plant but to a set of machinery used for rolling plates. A plant may contain as many as 30 mills, which is the number at the Shenango works. (GRAHAM, 849; REID, 867; GRIFFITHS, 890; GREER, 930.)

II. ORGANIZATION. CAPITALIZATION.

A. Organisation.—The American Tin Plate Company was incorporated under the laws of New Jersey on January 6, 1899. Its authorized capital is \$20,000,000 of 7 per cent cumulative preferred stock and \$30,000,000 of common stock. Of this \$18,000,000 of preferred and \$28,000,000 of common stock has been issued. (GRAHAM, 850; REID, 866.)

Mr. GRAHAM submitted a list of the companies entering the combination. The entire property of 29 of these was purchased by the American Tin Plate Company, while in the case of 9, which manufacture other goods besides tin plate, only that portion of the business concerned with tin plates was acquired by the combination. The capitalization of these separate plants can not be ascertained. (856, 857.)

Judge MOORE, who was the organizer of the American Tin Plate Company, describes fully the process by which it was promoted. The witness had previously organized other combinations, and was urged by a committee of tin-plate manufacturers to undertake a combination in that industry. There was a considerable delay before he took the matter up actively.

Mr. REID testifies that Judge Moore undertook the organization of the American Tin Plate Company at the instance of the various manufacturers, who indeed worked to that end for about a year. (866.)

Some manufacturers had in mind that Judge Moore should act simply as an intermediary in bringing them together, but, as has been his general experience in organizing combinations, he found it necessary to buy the plants outright. To do so, he obtained money from many different sources, borrowing large amounts personally, and securing subscriptions in advance to stocks from outside capitalists. Cash options were taken on the different plants. The owners were given the privilege, if they preferred, of taking stock, but if all of them had preferred cash it would have been forthcoming. When the manufacturers saw that the scheme was to be a success, they wanted stock largely.

An individual bargain was made with each owner, and the promoter sought to prevent any from knowing what the others received. This statement is confirmed by Mr. REID (884), Mr. GRAHAM (851), and Mr. GRIFFITHS (909). Judge Moore himself practically selected the first board of directors, choosing the best talent from among the manufacturers, in order thus to protect the investors and secure their subscriptions. (959-963.)

Mr. REID and Mr. GRAHAM also testify that Judge Moore bought the various plants which entered the combination outright, paying cash unless the owners preferred to take for every \$100 of cash \$100 of preferred stock and \$100 of common. Such owners as saw fit to do so invested in the shares of the company as they deemed best. The contract further required Judge Moore to furnish \$5,000,000 of working capital. (851, 883.)

B. Capitalization and value of plants.—Judge MOORE testifies that he found it necessary, in organizing the American Tin Plate Company, to issue a very large amount of stock in order to insure the success of the enterprise. It was necessary to pay commissions and bonuses in order to obtain many of the plants.

Each manufacturer was offered cash for his plant or the option of taking \$100 in preferred and \$100 in common stock for each \$100 in cash value. The cash value thus estimated included the good will of the individual plants; in fact it was the price which the owners were willing to take for the entire establishment. Mr. Moore, however, denies that the corporation is overcapitalized. "Everybody knows what they are getting when they get common; they know that they are not getting anything that represents assets." The preferred and common stock together have always sold for more than \$100 for a share of each. The extra \$10,000,000 of common stock above the amount of preferred stock may be considered the cost of promoting the organization. The promoter was required, however, to furnish \$4,500,000 or \$5,000,000 of cash working capital.

Mr. Moore does not remember the prices which were paid for the various plants, nor is he clear as to the total amount of stock or of cash which was used directly in securing the plants. He believes that the talent and good will engaged in each plant was, on the average, worth as much as the plants themselves. (960-963.)

Mr. REID and Mr. GRAHAM agree in the statement that the owners were either paid in cash or given for each \$100 of cash value \$100 in preferred stock and \$100 in common stock. Each plant was sold for all the owner could get. The cash value of the plants as thus fixed included good will, so that it is fair to calculate that the preferred stock offered to each owner was equal to the entire value of the plant, including good will. Mr. Reid admits that the total capitalization of the company is from three to five times greater than the cash value of the plants at the time of its formation. The cash prices paid were probably greater than would have been secured in a sale to a private buyer, since the owners knew or expected that a greater value would come to all plants from the combination itself.

Both these witnesses point out, however, that it would be impossible to rebuild the plants in the organization for the original cost of construction, or even for the amount of the preferred stock. The cost of materials for construction has greatly increased.

Mr. Reid and Mr. Graham are not clear as to the actual disposition of the \$18,000,000 of preferred stock and of the \$28,000,000 of common stock. They imply that a portion of the common stock, at any rate, went to the promoter as compensation for his work in bringing the plants together. (850, 851, 867, 883, 884.)

C. Profits of promotion.—Mr. MOORE states that his profits from the organization of the American Tin Plate Company did not come in the form of commissions, but that he himself during the process of organization practically bought all the plants, issuing as much stock as he found necessary and desirable in order to secure the plants and the necessary working capital, retaining for himself whatever balance of the stock remained. He made his profit in his own way. The organization of a company of this sort is an exceedingly difficult matter, involving very great risk. It is difficult to get capital from outside, and the manufacturers are hard to bring together. A strong and effective combination must be assured or stock can not be sold. Accordingly, bonuses of stock are necessary, and expenses generally are high, while on account of his efforts and risks and the benefits to manufacturers from successful organization the promoter is entitled to considerable compensation. (960-963.)

Mr. REID states that it was his general understanding that \$18,000,000 of preferred and \$18,000,000 of common stock were to be used for buying tin plate plants directly, and that the \$10,000,000 was to be placed in the hands of Judge Moore to be used at his discretion for the purposes of the organization. (866.)

Mr. GRIFFITHS states that it was a perfectly open arrangement that \$10,000,000 of common stock of the Tin Plate Company was to go to the promoter. He says that he read this arrangement in the written form of agreement which was submitted to each manufacturer. He does not know whether the expenses of the organization were to come out of this \$10,000,000. (911.)

D. Cost of plants.—Mr. REID testifies that, at the prices for materials which prevailed a year ago, a tin-plate plant of ten mills could be erected for about \$400,000. The cost would now be from 60 to 75 per cent greater. This excludes the cost of real estate. A twenty-mill plant would probably cost rather more than twice as much, on account of the heavier engines required. The cost thus estimated also excludes running capital. The witness believes that it would take \$25,000 per mill to supply proper running capital. (886.)

Mr. GRIFFITHS, who sold out a tin-plate plant to the combination, but who is now establishing an independent one, testifies that the price received by him for his plant was 25 or 30 per cent above its original cost. There was a general inclination on the part of the manufacturers not to communicate as to the price received by them, but it was generally known that there was a standard price for modern tin-plate plants on the basis of \$40,000 for each mill in the plant. The witness considers that the cost of plants of different sizes is fairly proportional to the number of mills contained. This \$40,000 includes the value of good will and everything. Two hundred and seventy-two mills were brought into the combination. The witness presumes that altogether these could have been built at that time for about \$12,000,000, "good will and all." The cost of materials for constructing plants has greatly increased during the past year, but it would not cost over \$25,000,000 to duplicate these plants. In fact Mr. Griffiths believes, from his present experience of building a tin-plate plant, that he can put one up at the rate of \$40,000 per mill to-day. (909-912.)

E. Dividends and value of stock.—The American Tin Plate Company declared its third regular dividend on the preferred stock in September, 1899. It had not up to that time made dividends on the common stock, but Mr. GRAHAM stated that it was his opinion that the company was making profits sufficient to justify such dividends in the future. (856.)

Mr. GRAHAM testified that at the time (October, 1899) the preferred stock of the American Tin Plate Company was selling at 85 and the common stock at 87. (860.)

F. Conformity to New Jersey incorporation laws.—Mr. REID, president of the American Tin Plate Company, stated that it had conformed to the requirements of the New Jersey laws, under which it is incorporated. The company has, as its agent in New Jersey, the New Jersey Registration and Trust Company of East Orange. Duplicate sets of the stock and transfer books have been kept in this office since the organization of the company, and the witness has been told that these are kept up in proper form. The company has also a transfer office in New Jersey and one in Chicago, and transfers are required to be registered at all of these different offices. There are no restrictions upon the rights of stockholders to examine the stock and transfer books. In evidence of the intention of the company to conform to the law, Mr. Reid submitted a copy of a resolution passed by the stockholders, appointing an agent of the company in New Jersey and providing for keeping the stock and transfer books open to the examination of the stockholders.

Mr. WHEELER, treasurer of the American Tin Plate Company, and Mr. GRAHAM, one of its vice-presidents, stated from belief and understanding that the books were properly kept in the New Jersey office, although neither of these officers is directly concerned with that phase of the business. (REID, 865; Graham, 857; Wheeler, 864.)

III. EXCESSIVE COMPETITION AS CAUSE OF COMBINATION.

Mr. REID and Mr. GRAHAM testified that previous to the formation of the American Tin Plate Company competition had become so strong that the business was fast drifting into a condition where there was no profit. The various manufacturers had held meetings to consider the conditions of their trade during the year preceding. There had been no failures of manufacturers, but few were making more than a very low profit, and Mr. Reid believes that had the combination not been formed fully 15 out of the 37 companies which entered it would by this time be closed down. Diminished profits rather than overproduction are to be considered the cause of combination. (855, 866.)

Mr. GRIFFITHS, an independent tin plate manufacturer, testified to his belief that the combination was not at all necessary on account of failure of separate manufacturers of tin plate to do a profitable business. The books of the Washington plant, with which he was connected, showed that a profit of 20 per cent on the investment was made (apparently 20 per cent per annum) during 4 months of the year preceding the formation of the combination, although the price of coke plates was then at its lowest figure, \$2.60. The manufacturers were simply discontented because they were no longer able to make a profit of 100 per cent, the rate which Mr. Griffiths claims he earned in his dipping plant for a few years after the establishment of the McKinley tariff, when he was able to sell plates at \$5.75 per box.

Mr. Griffiths admits, however, with regard to his own profits, that his mill was chiefly engaged in producing high-grade plates, which sold at high prices, and that these prices had not fallen materially during the time when the common grades had fallen greatly. The witness also admits that some mills, prior to the formation of the combination, may have been making no profits, by reason of improper management. To these it was a great relief to be able to enter the combination. But it would have been more advantageous to the country as a whole that such ill-managed establishments should fail rather than that a combination should be formed to prevent them from doing so, though it is indeed true that when a manufacturer is losing money he is more likely to cut prices and wages and generally to demoralize business than if he is making fair profits.

Mr. Griffiths further states that at the time the promoters of the American Tin Plate Company approached him and other manufacturers with a view to securing their entrance to the combination, the chief advantage held forth was the ability to control the market absolutely and to prevent competition, rather than to economize in the cost of production. The witness was assured that he could realize a larger salary than he had ever obtained before.

Mr. Griffiths admits that, had the combination in its present form not been established, the various manufacturers would soon have made some concerted arrangement for maintaining prices. They had been trying to arrange some method of doing so for two years before the American Tin Plate Company was organized. It is natural for those engaged in a business, especially where it has once made exceedingly high profits, to look longingly to maintaining profits at the highest possible rate. (896-902.)

Mr. GREER, district manager of the New Castle mills, replies to these statements of Mr. Griffiths. He declares that the Washington tin-plate mill was found, when the combination was formed, to be in the worst condition of any of the mills in the Pittsburgh district, so that a change in its management had to be made, which displaced Mr. Griffiths. Mr. Greer does not consider Mr. Griffiths to be thoroughly familiar with the tin-plate business. He denies the possibility of making a profit of 100 per cent with plates worth \$5.75 per box, or of 20 per cent with plates selling at \$2.60, but in this matter he mistakes Mr. Griffiths's statement. The latter refers to profits upon his investment, while Mr. Greer's comments proceed upon the assumption that the profit referred to is the percentage by which the selling price exceeds the cost of production of the box of plates. Mr. Greer believes that the formation of the combination was largely intended to prevent the cutthroat competition which had been prevailing. (923, 929.)

Mr. TAYLOR, an independent dipper of tin plate, testifies that when tin-plate mills were first established in this country many of the managers had had no experience, so that their production was not economical. The consequent losses or failure to make profits, together with the keen competition between the numerous plants, led to the formation of the present combination. Nevertheless, if the various mills had reduced their production during July and December of each year, they would have prevented the overproduction which depressed prices. In fact, the witness believes that most of the mills have made some money even during bad times. (941.)

IV. CONTROL OF PLANTS AND OUTPUT BY COMBINATION.

A. Proportion of mills in combination.—Mr. GRAHAM testifies that the tin-plate combination did not take in all the plants in the country, and certain others have been built since it was organized. There are about 39 plants in the combination and 6 outside. The most important competing plants are located in St. Louis, Harrisburg, Wheeling, Washington, Pennsylvania, Avonmore, and Cincinnati. (858, 861.)

Mr. REID adds that the capitalization of the outside tin-plate plants is probably about \$2,000,000 or \$2,500,000. The plants controlled by the American Tin Plate Company include some 300 mills, while there are 27 or 28 mills in the outside plants. The American Tin Plate Company thus controls somewhat more than 90 per cent of the producing capacity. (892, 893.)

Mr. GRIFFITHS testifies that, although he sold out his former tin-plate plant to the American Tin Plate Company, he does not think there is any moral obligation on his part to remain out of the business. He is accordingly erecting a steel plant to make his own billets, mills for manufacturing black plate, and a tinning house. It has been the purpose of the combination to prevent competition in every possible way. The witness believes, however, that the independent manufacturers can produce more cheaply than the combination. (887, 896, 899.)

B. Closing of plants and restriction of output.—1. *Dismantled plants.*—Mr. GRAHAM testifies that the American Tin Plate Company has dismantled one or two plants in Baltimore and one in Brooklyn, on account of their inefficiency and bad location. (858.)

Mr. REID stated that the combination had erected 20 to 25 new tin-plate mills, as compared with 10 or 12 mills which had been shut down. Aside from the two plants referred to by Mr. Graham as having been closed, Mr. Reid stated that a two-mill plant at Cleveland and a small plant called the Ohio River Plant had been dismantled. A plant at Johnstown was shut down as being unfavorably located, but was reopened by an arrangement made at the instance of the citizens of the town, by which the combination was able to get fuel at a lower freight rate. (876.)

2. *Temporary closing of mills and effect on labor.*—Mr. GRIFFITHS, while admitting that the American Tin Plate Company has advanced wages, as maintained by other witnesses, declares that it was practically forced to do so at the time, but that the workmen believe that it is the intention to reduce wages again, if possible, at the expiration of the present agreement in June, 1900. Mr. Griffiths.

believes that there is general apprehension and discontent among the employees. He judges this, for one thing, from the fact that 150 of the 816 rollers employed by the American Tin Plate Company have applied to him for work in his new plant. The witness submitted a letter to himself from a member of the Amalgamated Association of Iron and Steel Workers, dated November 14, 1899. This letter states that, while the American Tin Plate Company has recognized the unions and has made no radical changes, the workmen have much to complain of from the closing down of plants, and especially from apparent favoritism in operating certain plants at full capacity and closing others. It has been the custom in the past for mills to take orders in the fall for spring delivery, and thus to work fairly regularly, but the American Tin Plate Company, having complete control, does not intend to incur the cost of storage or to make concessions in prices to encourage future buying. The coming winter will accordingly see more tin-plate workers idle than ever before. Two large plants at Pittsburg were closed as early as October, throwing more than 1,000 workmen out of employment.

The letter further states that the agreement made between the American Tin Plate Company and the workmen in Chicago in July, 1899, permitted the company to disregard union wages in its plant at Monessen, but provided that, on the other hand, the amount of production which workmen should be allowed to put out should be limited, with a view to equalizing work between different mills. Nevertheless the writer declares that plants at New Castle are running at full capacity, while the Pittsburg and Cumberland mills are closed. The writer believes that at the New Castle mills a larger output per day is being made than was contracted for at Chicago. The managers may not compel their workmen to violate this rule, but they reward them for doing so by keeping up operation. The workmen see in all this a far-sighted policy to effect a reduction of wages. By shutting out a large number of workmen during the winter months, keeping at work regularly those whom they have always found pliant and subservient, and by doubling up in the mills that are in operation, promoting the younger workmen so as to insure a plentiful supply of skilled labor, the company expects to be in a position to enforce a reduction.

Mr. Griffiths further stated that at the time (November 15, 1899) 80 mills out of the 272 belonging to the American Tin Plate Company were closed. He admits that a strong organization and concerted action on the part of the workmen would prevent injustice in the closing of mills, but there are always some willing to make concessions.

Mr. Griffiths does not believe that the mills in the Pittsburg district have been closed on account of the difficulty of securing raw material. In fact, the reasons given by the combination for closing the plants are indefinite and unsatisfactory.

Moreover, the plant formerly owned by Mr. Griffiths at Washington, Pa., has run very irregularly, not over one-fourth of the time since June 1. Tin-plate machinery makers complain that there is less demand since the formation of the combination because of irregular operation. (899, 904-907, 914.)

Mr. GREER, manager of the New Castle and Shenango mills, in a sworn statement addressed to the Commission, explains the reason for closing down the mills. The former policy of manufacturing in the fall for delivery in the ensuing year prevented the manufacturers from securing a fair price for their product, either at the time of the contract in the fall or during the next year. Mr. Greer believes that losses from this source and other losses would have compelled more mills to close from bankruptcy than have been closed from shortage of orders by the American Tin Plate Company. Moreover the manufacturing capacity has been greatly increased by new mills brought into the combination during 1898 and the early part of 1899, so that it is in excess of the requirements of American consumers. Meanwhile, owing to the increase in the cost of materials in this country, a large part of the former export trade has been lost to our manufacturers. At the same time the present high prices prevent jobbers and consumers from buying tin plate in large quantities in anticipation of future wants. These facts account for the closing of the mills.

As to the discriminations in the selection of mills to be closed, Mr. Greer states that the New Castle mills have contracts for fuel extending into the year 1900; that the Monessen mills and others are advantageously located as to fuel supply. The Cumberland mill is not advantageously located, and it has no tinning department, while the sheet-iron trade is depressed so that there is a shortage of orders there. Other mills have had to be shut down in order to make extensive repairs and changes, since they have been in continuous operation for several years.

Mr. Greer especially denies that the workmen at New Castle are turning out a larger product than the agreement with the Amalgamated Association allows. There are in these plants six mills making larger plates, in which the limit of

output is somewhat different from that on the smaller plates. The closing of the Pittsburgh mills is due to shortage of orders. (925-927.)

3. *Failure to keep up with orders.*—Mr. GOING, who has been interested in the manufacture of tin cans at Baltimore, states that during the summer of 1899 there was a marked shortage of tin plate for the manufacture of cans. The various can manufacturers, being warned of the probable formation of the combination, had mostly made contracts for a sufficient supply of tin plate for the entire season. The American Tin Plate Company took over these contracts, but did not supply the materials promptly. A number of the mills of the Tin Plate Company were shut down for a time early in the year. Deliveries were sometimes 30 or 60 days late, and some of the can manufacturers were compelled to close for 2 weeks or longer. The deliveries finally caught up toward the close of the season, but there had been considerable loss on account of the delay. (917, 918.)

C. *Monopoly of rolling machinery.*—Mr. GRIFFITHS, who is engaged in building an independent tin-plate plant, testifies that the American Tin Plate Company has an arrangement with the makers of black-plate rolling machinery by which the independent mills can not secure equipment. The representative founders and machinists engaged in building machinery formed, at the instance of the American Tin Plate Company, a compact between themselves and with that company. There are 13 parties to this arrangement and only 2 outside, and 1 of these, the witness believes, is under the control of the American Tin Plate Company. Manufacturers of sheet iron can obtain machinery for rolling only on condition of signing an agreement not to make sheet iron for tin-plate purposes within 2 years. As the witness understands it, the title of the machinery remains with the seller, and the machinery reverts to him in case it is used contrary to the agreement. It is fairly possible to enforce such an arrangement, because sheet-iron plates intended for tinning are usually different in gauge and of somewhat higher and better finish than other plates.

The witness has no written evidence as to this arrangement, but has sought to secure machinery and has been told that he must comply with this condition. Very recently he has spoken with a man who stated that there was a disposition on the part of many concerned in the arrangement to break away from it, since they have not secured as many orders for machinery from the Tin Plate Company as formerly from separate manufacturers.

Mr. Griffiths formerly had an arrangement with the Avonmore Foundry and Machine Company for furnishing him with materials for his plant for 5 years. About a month before giving his testimony an order for two additional mills was practically refused, and a director of the American Tin Plate Company has since stated that he had put a large amount of capital into the Avonmore Company and thought it improper for that company to furnish machinery to a competitor. There is thus only one machine foundry left outside which will furnish rolling machinery to independent tin-plate manufacturers. (888-890.)

Mr. REID and Mr. GRAHAM admit that contracts have been made with manufacturers of rolling machinery by which the American Tin Plate Company is to have their entire production of tin-plate machinery, none being furnished to outside manufacturers. The company has such an arrangement with 6 or 8 manufacturers of machinery, but there are also 5 or 6 other manufacturers who are free to sell to all parties. The machinery is not covered by patents for the most part, although there may be patents on some minor details. The American Tin Plate Company gets the benefit of the skill of the engineers of the machinery makers under contract, and is entitled to the use of any improvements that are made. (852, 875.)

Mr. TAYLOR, an independent tin-plate dipper, testifies that he anticipates no difficulty in case he should attempt to buy rolling machinery, nor does he know of any monopoly of tinning machinery. (933, 935, 939.)

D. *Relations of combination with tin-plate dippers.*—Mr. GRIFFITHS testifies that the American Tin Plate Company is seeking to drive out of business the various concerns which have been engaged in "dipping," or coating with tin black plates obtained from other manufacturers. As soon as the contracts of various dippers with manufacturers who entered the combination had terminated, the American Tin Plate Company refused to furnish them with any more black plates. It would not sell them plates at all until they turned over their dipping machinery at a certain price to the combination. This condition exists generally. The witness knows personally of two or three firms which have thus been closed up, and believes that a majority of the twenty or more which existed have been closed. Many of these dippers have turned into jobbers, dealing in the product of the American Tin Plate Company. It is difficult to secure evidence from these, because the combination would injure their business if they testified against it.

Other dippers are making it a practice to buy plates already dipped and redip them, coating them more heavily, which increases their value. The American Tin Plate Company likewise refuses to furnish plates directly for this purpose, and dippers are buying them from large jobbers.

Mr. Griffiths adds further that independent tin-plate dippers can practically obtain black plates from no one else than the American Tin Plate Company, which absolutely controls conditions in the production of plates. Nor does he believe that the failure to supply black plates to dippers has been due to the inability of the American Tin Plate Company to keep up with its orders, especially in view of the fact that 80 of its 272 mills are now closed. He believes the action of the combination is a violation of law. (894-896, 899.)

Both Mr. REID and Mr. GRAHAM specifically denied that the American Tin Plate Company had refused to furnish black plates to responsible dippers for their business. There are practically as many dipping works in the country now as ever before, although perhaps one or two less. Mr. Graham mentioned the names of half a dozen such outside dipping plants, and stated that perhaps 20 per cent of the black plates manufactured by the American Tin Plate Company were sold to such outsiders for tinning purposes. (852, 860, 874.)

Mr. GREER, in a sworn communication addressed to the Industrial Commission, states that the large plants of the tin-plate combination at New Castle, Pa., are shipping large amounts of black plate to dippers in Chicago, Pittsburg, Philadelphia, Baltimore, and New York, and have entered new orders recently. From the various plants in the New Castle district the combination has shipped 81,000 tons of black plate to dippers during the year 1899, being equivalent to 620,000 boxes. The witness does not know that the American Tin Plate Company has ever refused to sell black plate to any responsible buyer or dipper who is prepared to pay for it and to comply with the terms of the sales department.

Mr. Greer states further, however, that during 1898 the price of tin plates was so low that manufacturers of black plates who were also equipped for tinning them could sell tin plates at a price at which the dippers could not afford to sell. A number of dipping plants accordingly turned into jobbers, purchasing roofing plates, which had been their chief product, directly from the mills.

The witness further points out that the tin-plate trade has long been handicapped by irresponsible dippers, who have put out inferior goods under numerous names, and who have often been unable to pay for the black plates. "As good business policy, the American Tin Plate Company, as dippers of tin plates, have tried to discourage the irresponsible brands that have been put out, with a view to having kept before the buyers only the American Company's own guaranteed brands or those made by responsible and well-established jobbers and dippers." The witness believes that the general quality of plates now turned out is much higher than before the combination. (924, 928.)

Mr. TAYLOR, of the N. & G. Taylor Company, of Philadelphia, testifies that that firm has been engaged in handling tin plate and articles made therefrom for 85 years. It has chiefly made special brands of tin plate of high quality, and was the first to introduce the device of stamping the plates with these brands to protect them. Before it was possible to manufacture plates in this country they were made for the firm, frequently under its own formula, in Wales and England. After the tariff of 1890 the firm established a large tinning plant, securing its black plates chiefly from American mills. Its reason for not establishing a rolling plant was that it desired to make its tinning works exceedingly comprehensive and of large capacity, and that it anticipated great improvements in methods of making black plate by American inventions, the advantage of which might possibly be gained by waiting.

The black-plate mills from which the N. & G. Taylor Company has secured its supply sold out to the American Tin Plate Company, but supplies for the season of 1899 had previously been contracted for, and the combination has promptly filled the contracts. The witness anticipates no difficulty in securing a supply of black plate in the future, although mills outside of the American Tin Plate Company can scarcely supply the demands of the N. & G. Taylor Company. The business of that company is prosperous, and although the present prices are practically fixed by the American Tin Plate Company, they are reasonable, in view of the increased cost of materials and labor. If it should prove necessary for economy for the N. & G. Taylor Company to manufacture its own black plates, it would establish a plant, and anticipates no difficulty in securing machinery.

Mr. Taylor adds, however, that his company does not compete, to any considerable extent, with the American Tin Plate Company. A large proportion of the consumption of tin plates is east of the Alleghanies, and the mills of the American Tin Plate Company, broadly speaking, are more in the western territory.

Moreover, the plates made by the N. & G. Taylor Company are of very high grades, while the combination naturally makes the plates which entail the least trouble—the more common grades. (981, 983, 989.)

E. Relation of combination with jobbers.—Mr. GRIFFITHS testifies that the American Tin Plate Company is refusing to manufacture plates for jobbers under private brands unless the jobbers will agree to buy exclusively from the combination. The mills themselves formerly owned very few brands of plates, but made plates under various names and brands which were owned by individual jobbers. The first memorandum issued by the American Tin Plate Company on this subject was to the effect that each jobber must assign these brands to the combination, which was to manufacture goods under them exclusively for the use of the jobber, with the arrangement that if the jobber bought tin plate of any grade, under any name, from independent manufacturers, the ownership of the brands would be absolutely forfeited to the combination. This first arrangement has been modified somewhat. The witness submitted the full text of the form of two contracts. The first provides that the jobber shall assign and transfer to the American Tin Plate Company the exclusive right to use, place, and stamp upon tin plates andterne plates the brands and trade-marks designated. The other provides that the American Tin Plate Company shall sell to the jobber at current market prices such quantities of plates as the jobber may require, branded as desired with the trade-marks assigned. The American Tin Plate Company is not entitled to use these brands on goods manufactured for any other person, and it agrees not to increase the price of any plates above current prices for goods of a similar grade, on account of the use of the trade-mark or for any other reason. In case, however, the jobber shall at any time order or receive any plates marked with any of the assigned brands, or with any other private brand, except from the American Tin Plate Company, the trade-marks and brands so assigned shall become the absolute property of that company. If, however, the American Tin Plate Company is unable to furnish sufficient plates to supply the jobber, he is entitled to purchase the excess from other parties.

Mr. Griffiths declares that the arrangement provided in the above contract is being carried out at the present time. He knows positively that the combination has refused to manufacture tin plates under jobbers' brands, because the jobbers would not assign the brands. The witness submitted a letter addressed to a jobber, dated October 1, 1899, which contains the sentence: "As you have not agreed to our conditions governing private brands, we assume that you wish to have these stamped under the mill brand, and have instructed the mill accordingly." Mr. Griffiths adds that, as a matter of fact, no other manufacturer of tin plate outside of the combination is able fully to supply the wants of jobbers, so that they are practically forced to make this agreement in order to secure plates. (891-893.)

Mr. REID and Mr. GRAHAM deny distinctly that the American Tin Plate Company has ever refused to sell black plates to any jobbers or has made any discrimination in prices or otherwise against them. They admit, however, that contracts exist between the American Tin Plate Company and some of the jobbers for the manufacture of special brands of tin andterne plate. These jobbers have been in the habit of handling those brands in the past, and the boxes are branded for them by the American Tin Plate Company at a slight extra charge. There was some talk of an arrangement by which jobbers thus buying special brands should be restricted in their purchase of tin andterne plates entirely to the American Tin Plate Company, but the arrangement was never closed and does not now prevail. The witnesses state that these special brands are not, of course, furnished to other jobbers. Mr. Graham adds that some of these special brands have been acquired by the American Tin Plate Company, although the goods are still made exclusively for the use of the former owners. He believes that there is a clause in the contract which guarantees to the jobbers that the prices for the goods of the particular brand shall not exceed that for plates of the same quality under the name of the American Tin Plate Company. He also believes that the contract contains no restrictive provisions as regards the purchases of the jobbers. (851, 852, 874, 875.)

F. Supply of steel.—Mr. REID and Mr. GRAHAM testify that the American Tin Plate Company has no special arrangements with steel companies to obtain control of their output to the exclusion of other tin-plate makers. Nevertheless there is something of a business connection between the National Steel Company and the American Tin Plate Company. Part of the directors of the steel company are also directors of the tin-plate company. Mr. Reid states that perhaps half of the steel used by the American Tin Plate Company is bought from

the National Steel Company, although the combination buys wherever it can get steel the cheapest. There are no conditions, according to Mr. Graham, by which the National Steel Company is excluded from selling to anyone else. He has seen at least some of the contracts with that company himself, and knows that there is no such provision. Mr. Reid states, however, that the connection between these two companies is the means of keeping the American Tin Plate Company well posted as to the conditions in the iron and steel industry, and that it tends to insure to the tin-plate company a supply of steel at all times. Several mills of the American Tin Plate Company had to be closed for a few days early in 1899 because of the inability of the Carnegie Steel Company to fill its orders promptly. Mr. Graham does not know that the American Tin Plate Company took the initiative in organizing the National Steel Company, although perhaps some of its officers were interested in having that company formed. (858, 863, 875; see also on this point under "National Steel Company," p. 192; also p. 194.)

Mr. GRIFFITHS, on the other hand, states that the American Tin Plate Company to a very considerable extent controls the supply of steel as raw material for the making of tin plates. The Carnegie Company is tied up for the entire year 1899 by an obligation to furnish a large quantity of steel to the combination. The witness does not know specifically that there is any contract by which this company is excluded from supplying steel to independent tin-plate manufacturers, but he has tried within 7 or 8 months past to purchase steel from the Carnegie Company, and could not obtain any. (894.)

V. EFFECT OF COMBINATION ON PRICES AND QUALITY OF GOODS.

A. Prices.—1. *General statistics.*—Tables of prices of tin plate, block tin, and steel, by months, since 1889, are printed in connection with the testimony of Mr. Reid (pp. 868, 869). In the Introduction a diagram is given showing the changes in cost of the quantities of steel and tin required to make a box of tin plates, together with the fluctuations in the prices of plates. Chief interest, of course, attaches to the period immediately before and after the formation of the American Tin Plate Company, which was organized January 6, 1899. Witnesses commenting on the tin-plate duty, however, point out that the decline of the price after the McKinley tariff of 1890, when the industry began to be established in the United States, shows the beneficial effects of that measure. (See below, p. 188.)

Witnesses defending the tin-plate combination maintain that the increase in the price of plates during the year 1899 was no more than commensurate with the greatly enhanced costs, especially the marked increase in the cost of raw materials—steel and tin.

2. *Opponents of combination.*—Mr. GRIFFITHS, an independent manufacturer of tin plate, denies that the cost of materials has justified the entire increase in the price of tin plate since the formation of the combination. Although the price of steel for tin-plate purposes has increased fully 100 per cent. and of block tin about as much, and although wages have increased from 10 to 15 per cent, this does not increase the cost of making tin plate sufficiently to account for the entire rise of 82 per cent in the price, from \$2.60 to \$4.65, which has taken place since December, 1898. The witness declares that when coke plates were selling at \$2.60 per box it cost him only \$2.40 per box to make them. At that time steel bars cost \$17.50 per ton. He does not believe that he could now buy steel at less than \$40 per ton, but thinks that the American Tin Plate Company obtains a lower price, perhaps as low as \$30. Even with the higher prices of block tin and other materials Mr. Griffiths declares that tin plate should not cost more than \$3.54 per box when the price of steel is \$30 per ton, and not more than \$3.84 when the price is \$36 per ton, whereas the selling price of plates is \$4.65 per box at present.

The witness also declares that he was making a profit of 20 per cent on the investment in his plant at the time when tin plates were selling at \$2.60 per box. He admits, however, that his concern was largely engaged in manufacturing specially high grades of plate, the price of which had fallen little, if any. The margin was small on the ordinary grades, but the company more than covered itself in the high prices for the special grades. (902, 903; see also above, p. 178.)

Mr. Griffiths admits that there has been an advance of 72 per cent in the price of Welsh tin plate during the past four months, as against the increase of 81 per cent or 82 per cent in the domestic product. He does not think that prices would probably fall very much below their present figure, even aside from the existence of the combination, if present conditions of trade continued. (915.)

3. *Reply. Increase justified by higher costs.*—Mr. GREER, replying to these statements of Mr. Griffiths as to the cost of production and prices, states that

there are various different qualities of plates having very different prices and cost of production, and that Mr. Griffiths's figures are scarcely clear. Most of Mr. Greer's reply, however, has to do with the cost of tinning plates, as distinguished from making the black plates, and refers to a period considerably prior to the formation of the American Tin Plate Company. (See above, p. 177.) Mr. Greer adds, however, that the increase in the price of tin plate has not been so marked as that in the price of many other materials having steel as the basis. Thus the price of wire nails has increased 200 per cent during 1899, and many other similar products in almost equal proportion. The advance in the price of steel bars for making tin plates has been fully 120 per cent, in block tin 150 per cent, and in labor from 15 to 25 per cent. Mr. Greer states further that in calculating the costs of production in the plants of the American Tin Plate Company the interest on capital invested is not included. Detailed account is kept of the cost of fuel, steel, repairs, and supplies of all sorts. All betterments and additions to the plants are charged to the construction account. The account of the tinning department is kept separate from that of the black-plate department.

There is considerable loss from inferior plates, known as seconds, which usually sell at about 25 cents per box less than firsts. There are from 8 to 12 boxes of seconds in coke plates out of every 100. In the case of charcoal plates there must be a higher allowance. (923, 928, 930.)

Mr. GRAHAM and Mr. REID, officers of the American Tin Plate Company, both maintain that the increase of prices of tin plate during the year 1899 has not been greater than, if indeed it has been equal to, the increase in the cost of the steel, tin, and other materials entering into its manufacture. Mr. Graham believes that on the whole the profits of the company have decreased since the rapid increase in the price of materials, while Mr. Reid states that the advance in prices has not been so great proportionately as the advance in costs of all kinds. The demand for tin plate has been heavy, so that, in fact, the consumption has been greater than the mills could supply.

Both of these witnesses state that the prices currently quoted in the *Iron Age* and other standard trade journals for steel and tin plates can be considered trustworthy, although they do not always indicate the actual prices obtained on the entire product of the mills at the time. The prices given in tables are usually those at New York, which would be 11 cents higher than the prices at the Pennsylvania mills. Mr. Graham points out especially that when the American Tin Plate Company was organized it had to take over large contracts which had been made by the constituent companies, some of them requiring 6 months or even 12 months to fill. These were at much lower prices than would be justifiable under the present conditions of cost. Mr. Reid also testifies that at the time of the organization of the American Tin Plate Company the various plants which entered into it had contracts with jobbers and others for supplying tin plate at low prices, ranging from \$2.65 to \$2.75 per box. These contracts amounted to about 4,000,000 boxes, and continued up to July 1, 1899. Moreover, the American Tin Plate Company, during the early months of 1899, made large contracts, which it was still working on when Mr. Reid testified, October, 1899, at prices much lower than have since prevailed, ranging from \$3 to \$3.75. (GRAHAM, 853, 862; REID, 867, 874, 881.)

Mr. GREER also states that many of the mills which entered the American Tin Plate Company had orders for future delivery extending up to October 1, 1899, or even to January 1, 1900. The entire product of the large New Castle and Shenango plants was thus sold in advance. Moreover, some of the smaller mills had not been cautious enough to cover their supplies for making this plate, and the American Tin Plate Company has been compelled to purchase materials at advanced prices in many cases to make products selling at low prices. (924.)

In support of these general statements Mr. REID made detailed statements as to the increase in the cost of materials, labor, etc. The price of standard coke plates increased from \$2.60 per box immediately prior to the formation of the combination to \$4.65 in October, 1899. These prices are at the mills. Meantime there had been an increase in the price of steel from \$17.50 per ton to \$38 per ton. At the time of the rapid increase in the price of plates from \$3.87½ to \$4.65 per box, steel advanced from \$22 to \$38 per ton. The price of tin has also doubled during the past year. Mr. Graham adds that the cost of acids, rolls and castings, fuel, etc., has also increased materially, while wages have been advanced about 15 per cent.

Mr. Reid expresses the opinion that the present high prices of steel, and consequently of tin plates, will run through at least all of the year 1900. (853, 867.)

Mr. TAYLOR, an independent tin-plate manufacturer, believes that the increase in the price of tin plate during the past year has been entirely justified by the increase in the cost of materials and of labor. If the price had not been advanced, the business would have been done at a loss. During the same time that the

American product has advanced \$2 per box, the price in Wales has advanced \$1.50 per box, and the witness considers that this difference of 50 cents no more than offsets the difference between the cost of labor in the two markets.

Mr. Taylor does not believe that the profits of the manufacture of tin plate are greater at the present high prices than they were before. The advance is normal. The price of tin was about 13 or 14 cents per pound in 1898, but rose in the latter part of 1899 to 34 cents, and in October still stood at 28 cents. This increase is due largely to the greater demand for tin in this country, as well as to the increase in the Welsh output. In the case of plates carrying very heavy coatings, such as those manufactured by the N. & G. Taylor Company, the increase in cost has been especially great.

Mr. Taylor admits that the American Tin Plate Company practically fixes the price of tin plates, but maintains that its action hitherto has not been arbitrary and unjust. (983, 984, 988, 940.)

A. Effects of increased price.—Mr. GOING believes that the increase in the cost of tin cans as the result of higher prices of tin plate can hardly be sufficient to affect the consumption of canned goods. An increase from \$2.60 to \$4.65 per box on tin plate would mean an increase in the cost of a can of three-fourths of a cent or a cent.

Mr. Going states further that can manufacturers so far have felt no special pinch from the combination, especially because they have had contracts for supplying their material during the year 1899. (918, 921.)

B. Quality of product of combination.—Mr. GOING, a retired manufacturer of tin cans, states that he has heard from canners that the coating of plates since the formation of the combination is thinner and less satisfactory. (916: as to relative quality of American and Welsh product, see below, p. 189.)

Replying to the statements of Mr. Going as to the relative quality of tin plate before and since the organization of the American Tin Plate Company, Mr. GREER declares that the quality at present is uniformly better. As district manager of the large New Castle plant, Mr. Greer has instructions from the head of the operating department at Chicago to make a good quality of plate. The mills are doing the best they can to improve and expect to turn out a still higher grade of plate next year. (926, 929.)

VI. RELATIVE ECONOMY AND ADVANTAGE OF MANUFACTURE BY COMBINATION.

A. Generally.—Mr. GRAHAM testified that the combination could effect saving by the large plants which it would employ, which would reduce the expense of operation. He believes that the plants have already been better managed in the short time since the combination. There have, however, been very few new devices or improvements in methods of manufacture for many years. As many men are required in the black-plate mill to-day as were required in Wales 7 years ago or even 25 years ago. The machinery used is perhaps heavier and stronger. Very few features of the machinery are covered by patents. (855, 857, 861.)

Mr. GRAHAM states that, while one of the chief purposes of the combination was to prevent suicidal cutting of prices, the American Tin Plate Company also expects to improve the physical condition and equipment of the plants. There is a marked difference in economy between the old-fashioned mills, with wooden buildings and few conveniences, and the modern plant, with iron buildings, electric cranes for handling the materials, etc. The appliances in larger mills will result in saving. (855.)

Mr. GREER believes that the time is too short to make possible a fair judgment as to the advantages and disadvantages of combination in the tin-plate industry. He believes that the present policy of the American Tin Plate Company is to consider carefully the interests of the buyer and to deal justly with all its customers. (920, 930.)

Mr. GRIFFITHS denies that the American Tin Plate Company can be in any way beneficial to the country as a whole. Whatever savings it may effect by shipping from the nearest mills, etc., go into its own pockets and are not divided with the consumer. The establishment of such a combination furnishes a bad precedent, tending to encourage other industries to enter into combinations for controlling conditions of business and to discourage individuals from entering into industry. The witness believes that the Tin Plate Company can pay dividends even on its inflated capitalization, at the expense of the consumer. The manufacturers would

never have gone into this company, surrendering their chances for making a good profit individually, unless they had expected a remarkably good premium of gain by the establishment of a monopoly. (910.)

B. Large plants.—Mr. REID testifies that by the control of a large number of different plants the tin-plate industry can be specialized to advantage. Thusterne plates can be finished entirely at one mill and coke plates at another. The saving, however, would not be great. The witness does not believe that the combination has as yet effected any saving in the cost of labor, and doubts whether it will be able to do so. (877.)

Mr. GRIFFITHS believes that the limit of economy in manufacture is reached with a plant of from 4 to 6 mills. He understands that the experience of Wales has shown a 4-mill plant to be more profitable than larger ones. (915.)

Mr. GREER, referring to the above statement of Mr. Griffiths, states that the opinions of the Welsh manufacturers as to methods of making tin plate are of comparatively little value. American ideas have advanced very rapidly and we have learned little from Wales. (925.)

It appears from the evidence above referred to under the heading of capitalization that the cost of erecting a plant with a larger number of mills is not proportionately less, but no detailed evidence is brought forward by the defenders of the tin-plate combination as to the relative cost of operation in such plants.

C. Personal superintendence.—Mr. GRIFFITHS believes that the independent manufacturer, before the combination and since the combination, has been able to manufacture tin plate much more economically than the American Tin Plate Company, chiefly because under separate control the individual owner is directly on the ground and continually cudgeling his brain in the direction of his own interest. The tin-plate business is a peculiarly difficult one, different from any other, and involving many details which greatly affect profits. It needs to be done under the personal eye of the owner. It is impossible for a manager who, according to the present practice of the American Tin Plate Company, is supposed to manage 20 or 30 mills in several different plants, and who is able to visit each one only about once a week, to get as good results as under the previous practice. There needs to be some one to look after the superintendent of the plant every day. The witness admits that there is some advantage in the practice of the American Tin Plate Company in requiring frequent reports from the superintendents of the different plants, and in comparing these reports to ascertain the relative efficiency. But this practice is not as satisfactory as direct management by the owner. (899, 900.)

To this Mr. REID and Mr. GREER reply that, as a matter of fact, a large proportion of the previous owners of tin-plate plants are stockholders and officers in the American Tin Plate Company, and that many of them are giving their undivided attention to the operation of the same mills which they had charge of before the combination. Thus, in the case of the large establishments at New Castle, Mr. Greer, the former manager, is still in entire control. (877; 926, 929.)

Mr. TAYLOR, an independent tin-plate dipper, states that one plant of reasonable capacity in a single place can be better managed than a number of scattered plants under a central superintendent. Supervision is extremely important in the tin-plate business, and can not be satisfactorily exercised by visiting officers. The American Tin Plate Company, however, realizes this, and is adopting the practice of dismantling outside mills and concentrating its production in a few large plants under the best supervision. (941.)

D. Economy in labor.—Mr. REID states that the combination has not reduced the number of its employees either as a whole or in proportion to the amount of product. It has not even reduced the expenses of office work, although the separate office establishments of the different plants have been discontinued, practically all of the men having been taken to the office at Chicago. (876, 877.)

Mr. GRIFFITHS testifies that the American Tin Plate Company has as yet made no savings in the cost of labor by combination. Even before the advance in the scale of wages the pay roll had become larger than before. He does not believe there has been much saving in the cost of superintendence. The district managers are paid at present about the same salaries as the various superintendents were formerly paid. (899, 900.)

E. Economy in purchase of supplies.—Mr. REID testifies that the American Tin Plate Company is enabled to effect some saving by its large purchases of supplies. Large buyers can obtain tin at 2 or 3 cents a pound less than smaller buyers. The combination uses perhaps \$40,000 worth of acid per month, and there is some economy in the purchase of this in large quantities. (877.)

Mr. GRIFFITHS, an independent manufacturer, also believes that the combination makes savings by its large purchases. He understands that it buys all of its block tin from Phelps, Dodge & Co., of New York, and all of its palm oil from Crookes & Co., etc. The individual manufacturer would perhaps not be able to lay in a 6-months' supply of material in advance as the combination is able to do. The saving in this regard is perhaps comparatively small, however. The witness suggests also that the American Tin Plate Company may be paying much less than the current market price for its steel. On this subject see the statements as to the relation between the combination and the various steel companies, pp. 192, 194. (913.)

F. Savings in freight.—Mr. GRAHAM states that the Tin Plate Company receives no special freight rates from railways, so far as his personal knowledge goes. But there is a saving in freight by shipping goods from the most convenient mill. Thus, orders for goods in the East will be furnished from the Pittsburg and other Eastern plants, and Western orders from the Indiana and other Western plants, whereas formerly there was large expense from long shipments and cross freights. (856.)

Mr. REID also claims a saving of freights in this manner. (877.)

Mr. GRIFFITHS admits that there may be considerable saving to the combination by the ability to furnish tin plates from the nearest mills, saving the crossing of freights. He does not believe that this saving is sufficient to offset the disadvantage of the lack of personal superintendence by the owner. (913.)

Mr. TAYLOR, an independent manufacturer, is of the opinion that considerable savings must be made by the combination in this way. (942.)

G. Economy in selling.—Mr. REID states that the former method of selling was not especially expensive, since the owners and managers of the plants attended largely to the sales business themselves. Nevertheless, the present system of consolidation, which enables these managers to devote their entire time to the mill instead of giving a part of it to the selling business, results in the manufacture of a better product. (877.)

Mr. GRAHAM states that under the combination there is an unquestionable and large saving in the selling of goods. The company has been able to dispense with the services of numerous traveling and commission men. Each separate plant formerly had a more or less elaborate system of distribution. (855.)

VII. EFFECT OF COMBINATION ON LABOR.

(See also as to closing of plants. pp. 177, 178.)

A. Increase of wages.—The number of employees of the American Tin Plate Company, according to Mr. GRAHAM, is 20,000 or 25,000. Practically all the concerns in the combination pay the scale of wages fixed by the Amalgamated Association of Iron, Steel and Tin Workers. There is one mill at Monessen, Pa., which has somewhat different machinery, in which a slight variation is allowed by agreement. Mills which formerly did not pay this scale of wages have been brought up to it. (858, 861.)

Mr. REID testifies to the same effect as Mr. Graham. He adds that a general advance of 15 per cent in the wages of skilled labor has been made since the formation of the combination, while the wages of ordinary labor have been advanced about 20 per cent. In adjusting scales between different mills there has been a still greater advance in many cases.

Mr. Reid also submitted the full text of the existing agreement with the Amalgamated Association governing rolling mills manufacturing tin plate, for the year ending June 30, 1900, together with the corresponding scales and regulations for the years 1899, 1898, and 1897. The wages fixed in these tables are for piece-work, so much being paid per ton for the different kinds of work on plates of different sizes. A limit of the amount of work which any man is allowed to perform and receive pay for during 8 hours, the length of the day's work, is imposed, varying according to the thickness of the sheets rolled.

The wages are arranged upon a sliding scale, the base prices given being computed upon a selling price of \$4.25 per box for coke tin plates. For each 10 cents increase in the price per box 2 per cent is to be added to the price fixed for the different classes of work. The agreement for the year ending June 30, 1900, however, provides that the base prices named shall be the minimum for that year, so that there can be no reduction whatever until the expiration of that time.

Mr. Reid also submitted a statement showing the relative wages in 1898 and 1899 of the blacksmiths, carpenters, and miscellaneous workers and laborers

employed by the American Tin Plate Company who do not come under the agreement with the Amalgamated Association. Where the rate of wages per day was less than \$1.50, prior to January 1, 1899, the new rate is 15 per cent higher; from \$1.50 to \$2.12 per cent higher; and from \$2 to \$2.50, 10 per cent higher. In the finishing department, including the tinner's, the advance since January 1, 1899, has been from 15 to 50 per cent. (869-874.)

Mr. REID states further that the skilled laborers of the American Tin Plate Company are the best-paid laborers in the country. There is 1 roller to each mill for each shift. He can make, under the present scale of prices, nearly \$10 per day for 8 hours' work. He may have an assistant roller, but the next most skilled men are the doubler and catcher, who make \$6 or \$7 per day. The workers in the tinning establishment are also paid on a regular scale fixed by the recently formed union. A tinner can make, the witness understands, from \$2.50 to \$3 per day and his helper \$2 per day. The work is not highly skilled. In Elwood, Ind., for example, most of the workers were taken from the farms or the streets and became sufficiently skilled within 2 or 3 months.

In addition, there are many ordinary laborers employed in the packing and shipping work, their present wages being \$1.40 per day. Women are also employed in the packing houses, and make about \$1.25 per day. Some boys as young as 16 years of age are employed, chiefly in managing the grease in connection with the rollers.

The witness believes that the skilled laborers engaged in this industry live very well: that they have pianos, horses and buggies, lace curtains, and all the comforts of life. (879.)

B. Strikes and union labor.—Mr. REID stated that the American Tin Plate Company had encountered only one strike, which was confined to a plant at Lisbon, Ohio. It was a nonunion mill, and during the process of unionizing it there was a temporary misunderstanding, but the mill is now operating under the Amalgamated scale. (876.)

Mr. GREER, district manager of the New Castle mills, states that the American Tin Plate Company agreed with its workmen to allow them to unionize all the mills, save the one at Mousessen. He knows of no strikes since the organization of the American Tin Plate Company, except an unimportant one at Elwood, Ind., caused by the discharge of one of the workmen for taking spirituous liquors into the mill in violation of the rules. He believes that the officers of the Amalgamated Association were not justified in declaring this strike.

The American Tin Plate Company has always been ready to recognize the unions and to treat with them. (928.)

C. Ownership of stock by employees.—Mr. MOORE and Mr. GRAHAM both point out that a certain number of employees of the American Tin Plate Company own small amounts of stock. Mr. Graham states that the company has not specially sought to encourage this. Mr. Moore says that he took special pains to furnish small amounts of stock to employees desiring it at the time when the combination was being formed. (854, 961.)

D. Labor in dipping plant.—Mr. TAYLOR states that the N. & G. Taylor Company pays very full wages in its tinning plant, the rates being graded for the different processes according to the skill. The most skilled labor is paid by the piece. Some women are employed to clean plates. The employees are not organized, but the witness believes that the wages are about the same as those of union labor. There have been no strikes, and the men have always been well satisfied. It is necessary to have efficient labor on account of the high grade of tin plates produced by this company. Most of the labor is native, although a few Welshmen were employed at the time when the works first started. (932, 936.)

VIII. THE TARIFF AND THE TIN-PLATE INDUSTRY.

A. Effect in building up manufacture.—1. *Generally.*—It is made clear by the evidence of all of the witnesses that the tin-plate industry in the United States has been built up practically since the McKinley tariff of 1890, which raised the duty on tin plates from 1 to 2.2 cents per pound. Without the protection, all the witnesses agree, the industry could not have been profitably established. Having once been established, it was able to submit to the reduction of the duty to 1.2 cents by the Wilson tariff of 1894, and is now sufficiently protected by the duty of 1.5 cents under the Dingley tariff of 1897.

Mr. REID pointed out that the tariff on tin plate had built up a great industry giving employment to thousands of men, not only in the tin-plate mills themselves, but in the manufacture of steel for the plates, of acids, and other supplies.

All these raw materials were formerly manufactured abroad, and by bringing the manufacture to this country employment has been greatly increased. Possibly \$30,000,000 has been kept from going abroad for payment for such raw materials. (878.)

2. Lowering of prices.—Mr. REID says that the introduction of the industry into this country has decreased the cost of tin plates to the consumer. Before the tariff of 1890, the prices of tin plates had been \$6 or \$7 per box, while since that time they have run down as low as \$2.60, and are even now only \$4.65. The average price now is from \$1.50 to \$2 per box lower than before plates were manufactured in this country. (878.)

Mr. TAYLOR, an independent dipper of tin plate, likewise declares that the establishment of the tin-plate industry in this country, owing to the tariff, has saved many millions of dollars to consumers in lowered prices, and has very greatly increased the employment of labor. He believes that the conditions for making tin plate are more favorable in this country than anywhere else. The establishment of the tariff was not due especially to organized labor, but to the recognition of the desirability of establishing this new industry. (934.)

Mr. TAYLOR further states that immediately after the passage of the McKinley act, and before the duties went into effect, large quantities of tin plate were imported with a view to gaining the profit at the time of the increase of tariff. But the importations were so large that prices declined immediately after the tariff went into effect, and they have been lower ever since than before the act of 1890. (935.)

3. Early history of industry and tariff.—Mr. REID, president of the American Tin Plate Company, testifies that when the tariff was first established in 1890 numerous mills were soon erected, but that for some time they were operated, at least in certain instances, at a loss, because of the ignorance as to methods. Many Welshmen were brought over, and the witness considers that their knowledge was not adapted to American conditions. The plant at Elwood, Ind., was at one time selling tin plates at \$5.85 per box which cost \$9 to make. (878.)

Mr. GREER also states that the American methods of production are much superior to those employed by the Welsh. Nearly all of the old Welsh ideas have been abandoned during the development of the industry in this country. By careful and intense application of American engineers and workmen very great improvements have been made. (925.)

B. Sufficiency of protection.—Mr. REID further testifies that the tariff at present is sufficient to prevent the importation of tin plates of ordinary grade. The price of tin plates at the mills in the United States in October, 1899, was \$4.65, while the price of foreign plates at New York was \$5.27½. There is practically a margin of 50 cents, which could at the present prices be taken from the duty without admitting foreign tin plate. (878.)

Several witnesses testify that at present no tin plate is imported into this country, unless of certain special high grades, or unless intended for reexportation, with a drawback of the duty. Mr. GOING states that imported tin plate is invariably used in the manufacture of tin cans intended for exportation of food products. It was also pointed out that the Standard Oil Company imports large amounts of tin plate for making its tin cans for shipping oil abroad. (GRIFFITHS, 915; GOING, 931.)

C. Necessity of protection.—Mr. GRAHAM, vice-president of the American Tin Plate Company, declares that the removal of the tariff on tin plate would destroy the industry in this country. (854.)

Mr. GRIFFITHS, an independent manufacturer of tin plate, also maintains that protection is still necessary in the United States to enable the tin-plate industry to be carried on profitably. Even at the time when the price of tin plates was lowest in this country, during 1898, the minimum cost in New York would have been \$2.78 per box, whereas the imported tin plate could have been put down there at \$2.18 per box, exclusive of the duty. (909, 910.)

Mr. TAYLOR, an independent dipper of tin plate, agrees that it would be impossible at present to dispense with the tariff. If the conditions existing during 1898 had continued, it might have been possible to manufacture tin plate in this country at as low a cost as in Wales. Protection is especially necessary to prevent speculative importations of tin plate at particularly unfavorable times.

The immediate result of the abolition of the duty on tin plate, according to Mr. Taylor, would be to increase the price of the foreign product materially; much of it would immediately come to this country. American manufacturers could not at first compete against this importation, but might gradually adjust themselves to the changed circumstances. It would be necessary to reduce wages largely, or else men would be thrown out of work. Profits would have to be much less than

at present. The raw materials for manufacturing tin plate would also have to be obtained at lower prices, which would have a reacting influence upon the iron and steel industries. In fact, it would be impossible to disturb the tariff on tin plate without disturbing everything else. (934, 939.)

Mr. GRAHAM states that the rates paid to workmen in the tin-plate industry in this country are two and one-half to three times greater than in Wales. (861.)

Mr. REID states that he believes the rollers, or most skilled laborers in the tin-plate industry, receive about \$3.50 per day in Wales as compared with nearly \$10 in this country. (880.)

Mr. TAYLOR testifies that there are no large aggregations of capital or combinations of manufacturers in the tin-plate industry in Great Britain, except that a few English manufacturers of large tin sheets have always been combined during the past 25 or 30 years. (940.)

Notwithstanding the great improvements in production in this country, Mr. REID believes that the cost of production in Great Britain, especially on account of the lower wages of labor, will long continue to be so low that American tin plate can not be exported in competition. The cost of labor is a large item in the cost of tin plate, and wages of skilled labor are almost three times as high in this country as in Wales.

Mr. Reid further states that there are about 400 tin-plate mills in Europe, as compared with 300 in this country, but that the United States can produce 30 per cent more per mill. This country, he believes, consumes practically two-thirds of the tin-plate production of the world. (882.)

D. Relative quality of American product.—Mr. GOING, who has been engaged in the manufacture of tin cans and the canning of goods, testifies that when tin plate first began to be manufactured in the United States it was somewhat inferior. But by the improvements in machinery, methods, and skill the black plates have been made more ductile and the coating has been put on more satisfactorily. Mr. Going states, however, that imported tin plate formerly carried 5 pounds of tin to 100 pounds of black iron. Several years ago, when the business commenced to be less profitable in this country, the amount of tin was reduced and is now about 2½ pounds. The witness has been told by can manufacturers that the coating has become still thinner since the formation of the combination. Can manufacturers desire good plate, since they have to guarantee that the contents of the can will not be spoiled. While the effect of poor or thin coating on the contents of the can is not apt to be injurious to health, the inside of the can is likely to become discolored and unsightly. (916, 920, 921.)

Other witnesses, however, maintain that American tin plates are superior, both in the quality of the black plates themselves and in the tinning. This is claimed by Mr. GRAHAM, of the American Tin Plate Company. (861.)

Referring to the statements of Mr. Going, Mr. GREER, the manager of the New Castle mills, states that no coke plates used for canning purposes made in Wales or in America ever carried 5 pounds of coating. Only very high grades of charcoal plates have such a coating. Welsh coke plates for canning purposes have for several years been less heavily coated than American plates. Mr. Greer also refers to the great softness and ductility of American Bessemer black plates. (926.)

Mr. TAYLOR, an independent tin-plate manufacturer, likewise states that American Bessemer black plates have improved greatly in quality and are very largely superior in ductility, tensile strength, surface, and finish to those made abroad. Few improvements have been made here in open-hearth steel plates, but there is comparatively little difference in the quality of our Bessemer and open-hearth plates. In some of the high grades also the American product has improved less rapidly and is still inferior, but these are unimportant in quantity.

Considerable improvements have also been made in this country in tinning. (932, 936.)

E. Effect of tariff on combination.—None of the witnesses attribute the formation of the existing tin-plate combination to the tariff in any other sense than that the industry itself owes its existence to the tariff. Mr. REID specifically denies that the tariff had anything to do with the formation of the American Tin Plate Company. (881.)

Mr. GRIFFITHS, an independent manufacturer of tin plate, who is opposed strongly to the American Tin Plate Company, likewise holds that the tariff can be considered in no sense the father of the trust. (912.)

NATIONAL STEEL COMPANY.

WITNESS.

Page.

Reis, Wm. E., president of the National Steel Company 943-953

I. ORGANIZATION, CAPITALIZATION, ETC.

A. Organization.—Mr. REIS, president of the National Steel Company, states that that company was organized in February, 1899, under the laws of New Jersey, with a capital of \$39,000,000, \$27,000,000 of 7 per cent cumulative preferred stock and \$32,000,000 of common stock. The company includes six steel plants, located at New Castle, Youngstown, Sharon, Mingo Junction, Bellaire, and Columbus. These plants are engaged in producing steel billets and slabs, which are the raw materials for making tin plates and various other products. The plants include 15 blast furnaces. The company also owns iron mines in northern Michigan at Iron Mountain and Ishpeming. These are expected to produce from 1,250,000 to 1,400,000 tons of ore annually, the total amount required for the use of the steel plants in the combination being about 3,000,000 tons. The National Steel Company also owns nine lake boats for transporting ore, capable of carrying about 1,000,000 tons annually. (944, 945.)

B. Conformity with New Jersey corporation laws.—Mr. REIS submits an extract from the minutes of the first meeting of the stockholders directing the appointment of an agent and the establishment of a principal office in the State of New Jersey and providing for a record of stock transfers to be open at all times to the inspection of stockholders. So far as the witness knows, this resolution has been carried out and conformed to. (903.)

C. Capitalization.—The organization of the National Steel Company was accomplished by Judge Moore, the organizer of the American Tin Plate Company, and the method employed was substantially the same in each case. The various concerns in the combination gave options on their plants, with the privilege of taking all cash or part or all stock. The plant with which Mr. Reis was connected chose to take all stock in the transaction. One share of preferred stock was given for each \$100 of cash value, and in addition one share of common stock. The cash value in the case of Mr. Reis's plant was that which had been fixed in an offer made for the plant by another company 30 days before the organization of the combination.

Mr. Reis does not know exactly the disposition made of the stocks of the company, but states that it was the general supposition that the additional \$5,000,000 of common stock above the amount of preferred stock was used in the promotion of the scheme. At the present market values of common stock this surplus would be worth about \$2,500,000. The general expenses of bringing together such a combination are very considerable. (944, 949; compare Moore, 959.)

D. Dividends.—The company has so far (October, 1899,) paid two quarterly dividends upon its preferred stock and the president states that its profits exceed its dividends. The company has been making improvements and enlarging its plant and there are hopes that it may pay dividends on the common stock. The present value of preferred stock on the market is 95 or 96: of common stock, 50 to 52.

E. Value of plants.—The steel plants in the combination are capable of producing 5,000 tons of steel per day. It was formerly roughly estimated that to erect a blast furnace would cost \$100,000 for each 100 tons of daily production. Mr. Reis declares, however, that the three blast furnaces which are now being built by the National Steel Company will probably cost three times the amount of this estimate, owing to the very great increase in the cost of machinery, materials, and labor. Moreover, in order to run a plant properly there ought to be working capital to an amount equal to at least half of the cost of the plant itself. The iron ore used has to be brought from Lake Superior during the open season of navigation, and it requires considerable money to freight and store it until it is used.

The mining properties owned by the National Steel Company in northern Michigan are considered by Mr. Reis to be of very great value, especially in view of the marked increase in the price of ore, which Mr. Reis believes is likely to remain at the present high values. These mining lands are perhaps worth 200 per cent more now than they were a year ago. The witness is unable to estimate for how long a period the mines owned by the National Steel Company will be able to

supply its demand. During the years 1892 to 1898 there had been many failures in the iron region, due to the excessive competition and surplus of production above demand, and especially to the development of the Mesaba region, where the cost of production at first was insignificant. (945, 949, 950.)

II. OUTPUT. PRICES.

A. Control of output.—Mr. REIS testifies that the National Steel Company is not a "trust" in the ordinary sense, since it makes no attempt to secure control of a large proportion of the output of steel. Its economies are sought in the combination of steel plants with sources of raw materials. The National Steel Company produces only about 18 per cent of the Bessemer steel made in this country. The other chief concerns engaged in steel production are the Carnegie Steel Company; Federal Steel Company; the Maryland; Jones & Laughlin Steel Company; Wheeling Steel and Iron Company, and the Lorain Steel Company.

B. Prices.—Mr. Reis testifies that the increase in the price of steel has been due to the great increase of demand and to the fact that surplus stocks and materials have been exhausted by the heavy exportation of the past 2 years. The average price of Bessemer pig iron in 1894 at Pittsburg was about \$11.38; 1895, \$13.72; 1896, \$12.14; 1897, \$10.13; 1898, \$10.33. The present advance in prices commenced in December, 1898, and at the time of the testimony, October, 1899, the price of pig iron was \$22.50 to \$23. The National Steel Company is a large buyer of pig iron, besides manufacturing it itself, and naturally has had no effect in forcing up the price. The price of steel billets—the main product of the National Steel Company—has varied in somewhat the same proportions as the price of pig iron. The average price per ton in 1894 was \$16.58; 1895, \$18.48; 1896, \$18.83; 1897, \$15.08; 1898, \$15.31. The quoted prices since January, 1899, have ranged from \$34 to \$38, with an occasional price for a small quantity, under special circumstances, as high as \$44, such figures as these last, according to Mr. Reis, in no sense representing the true market.

Mr. Reis points out especially that, owing to the large contracts made in advance by steel plants, the actual average price received by them during the year 1899 has been much less than the quoted price for new contracts. Thus during August the average price received by the National Steel Company was only \$21, while the market quotations ranged from \$31 to \$44. In October the company had contracts on hand for 700,000 tons of steel.

As to the general increase in the demand for iron materials and steel during the past 2 years, Mr. Reis states that the increased use of iron and steel for structural purposes, especially in erecting large office buildings, has so greatly raised the demand as to explain largely the advance in prices. He considers that this demand is likely to continue and increase. As a result of this increased demand for iron, practically all of the pig-iron furnaces in Pennsylvania are now in operation. Some of these have been idle during the past 5 or 6 years, but they were mostly antiquated plants, which will not be able to live if the present high prices cease. (945, 946, 950, 951.)

III. ADVANTAGES OF CONSOLIDATION.

Mr. REIS testifies that the National Steel Company was not formed especially on account of the unprofitable condition of business. Several of the plants which entered the combination, if not all of them, were fairly prosperous and had been running continuously. It has already been pointed out that the combination makes no attempt to control the supply of steel. The main advantage of the organization of the National Steel Company has been in bringing the production of raw material and of steel together. This has put the companies in the combination into a better condition to compete with the other large concerns. To secure raw materials, ore and coal, is absolutely essential to the success of the business, and to the extent that the company itself controls the source of these raw materials it is in a stronger position.

Some saving will also be effected in freights by shipping goods from the nearest transportation point. (947.)

IV. LABOR.

Part of the works of the National Steel Company, according to Mr. REIS, are operated by labor belonging to the Amalgamated Association of Iron and Steel Workers, while the others are nonunion. In both cases, however, the wages of

practically all of the men are fixed by agreement for the entire year. It is not possible to make the rate uniform in all different plants, because the methods of production and local conditions vary materially. Thus a modern plant is allowed by the Amalgamated Association to manufacture more per man than an old-fashioned plant. The men not belonging to the Amalgamated Association get relatively the same wages as those in the association.

There has been a marked increase in wages for all skilled labor employed by the National Steel Company. The new scale adopted on July 1, 1899, for the ensuing year, increased wages in some cases 15 per cent and in others 20 per cent.

There have been no strikes since the organization of the National Steel Company. The company has increased the number of employees, but this is partly due to the fact that new construction is going on. About 8,000 men are employed at all the steel works, 1,800 more than were employed in March. But the several plants which entered the combination had mostly been running quite regularly before the combination was formed. (946, 948, 951.)

V. RELATIONS TO AMERICAN TIN PLATE AND AMERICAN STEEL HOOP COMPANIES.

Mr. REIS testifies that there are a number of directors in the National Steel Company who are also directors in the American Tin Plate Company and the American Steel Hoop Company. In fact, all of the members of the executive committee of the steel company are large stockholders in the others, while all the companies have the same treasurer. Nevertheless there is no formal relation between the three companies, and they make contracts with one another in the same way as with any other concern. The National Steel Company sells perhaps one-fourth or one-fifth of its product to the American Tin Plate Company. The object of the relation between the different companies is to assure them markets for their products and sources of supply for their raw materials. (947, 948.)

VI. TARIFF.

Mr. REIS states that the tariff, so far as it is placed upon steel billets, bars, and sheets, is no longer necessary for the protection of the industry. No steel is imported, and during the past 8 or 10 years the tariff has cut no figure. But if the tariff should be removed from tin plate or from certain other branches of the iron and steel industry there would be an indirect effect upon the making of steel. (947.)

AMERICAN STEEL HOOP COMPANY.

WITNESS.

Guthrie, Charles S., president	Page. 953-958
--------------------------------------	------------------

I. ORGANIZATION.

Mr. GUTHRIE, president of the American Steel Hoop Company, testifies that it was incorporated on April 17, 1899, with a capital of \$14,000,000 preferred stock and \$19,000,000 common stock. The products of this company are a variety of light iron and steel hoops, bands, cotton ties, bars, rounds, and half-rounds, etc. These are all rolled on high-speed rolls.

This company, like the American Tin Plate Company and the National Steel Company, was promoted by Judge Moore and is more or less closely related with the companies just named. (953, 954, 957.)

II. PRICES.

The prices of the products of the American Steel Hoop Company have advanced greatly since the formation of the combination; but, according to Mr. Guthrie, the increase has not been relatively as great as that in the cost of raw material. Just before the company was organized, steel, the chief raw material, cost about \$18 or \$19 per ton. At present (October, 1899) the price is from \$34 to \$38. The former price for the base of the product of the company was \$1.40; at present it is \$2.15. The price for hoops or bands is about \$50 per ton, as compared with \$35 to \$38 for the raw material. (954.)

III. ECONOMIES.

Mr. GUTHRIE says that one of the chief advantages of the consolidation in the American Steel Hoop Company is the possibility of specializing products in different plants. Eighty-five or ninety different sizes of goods are produced, which would necessitate constant changing of the rolling machinery in a single plant. At present one mill may be given a large order for a particular class of goods, with an economy of from \$1 to \$1.50 per ton.

Further saving is effected by concentrating the management, bookkeeping, etc., in one office. Miscellaneous expenses are thus materially reduced. Thus the expense of selling was formerly never less than 50 cents per ton and usually \$1. It has been reduced to 40 cents per ton.

The company takes pains to require daily reports from each plant and to compare these reports carefully, with a view to preventing carelessness and inefficiency on the part of the superintendent.

By shipping from the nearest plant considerable saving in freight is made.

The combination has sought to put its plants in control of the most able managers. If a previous owner or manager of a plant has shown himself thoroughly competent he retains his position after the plant joins the combination; older and less efficient men, who frequently desire to retire, are displaced by younger and more energetic men.

The combination is also advantageous in developing the export trade. The large capital and the large amount of business make it possible to employ agents all over the world and to spend large sums in pioneering, as would be impossible for a smaller concern. (953, 954, 956, 957.)

IV. WAGES.

Mr. GUTHRIE testifies that the wages paid by the American Steel Hoop Company have been advanced from 15 to 25 per cent since its organization. About half of the men employed belong to the Amalgamated Association of Iron and Steel Workers. The Pittsburg mills are nonunion. The nonunion men are paid practically the same rates as those belonging to the association, contracts being made individually with the men. In a sense the Amalgamated Association fixes the wages for these men and is thus a benefit to them.

The wages are fixed by annual agreement, the rates differing in the different plants according to the conditions, the machinery used, etc. Some classes of work are adjusted on a sliding scale, wages varying with the price of the product. (955.)

V. TARIFF AND EXPORT TRADE.

Mr. GUTHRIE believes that protection is still necessary for American steel and iron products, although we can already compete in the sale of those products practically throughout the world and are likely to be more and more able to control the world market. In the absence of a tariff foreign manufacturers make America a dumping ground for their surplus product. They expect to get their profit from the home trade and maintain prices there by disposing of temporary surpluses in this country. The ocean freights from England to Galveston and Charleston, for example, are less than the rail and ocean freights from Pittsburg to those cities.

The fact that we export steel is no sign that we need no protection. American manufacturers, too, sometimes follow the practice of exporting a surplus product at a price less than the average cost of the entire output—considerably less than the price in this country. The Carnegie Company thus at one time proposed to sell a large quantity of steel abroad at 20 per cent less than the domestic price in order to "keep things moving and bring gold back to this country." A year ago the American Steel Hoop Company was exporting its products quite freely. At present it can export only by cutting prices, on account of the high domestic demand. If, however, favorable ocean freights can be obtained, especially by the establishment of an American merchant marine, our steel products can compete in every country, even in England itself.

This country has a very great advantage over England in the cheapness of raw material for making steel and iron products. The cost of coal in England is \$4.50 per ton; in Pittsburg, \$1.50. Iron ore costs less, and transportation rates on the Great Lakes are lower than anywhere else in the world. The Americans have high ability and intelligence, and it is only a question of time when they will control the iron and steel markets of the world. (955, 956.)

VI. RELATIONS WITH STEEL COMPANIES.

Mr. GUTHRIE refers to the connection between the American Steel Hoop Company and the National Steel Company and the American Tin Plate Company. (This relation is also discussed in connection with the testimony concerning those two companies; see pp. 186, 192.) The arrangement has brought together the greatest ability engaged in a variety of iron and steel industries, and in this way all the branches are developed. Thus the National Steel Company, as producer of raw material, may agree to furnish a large quantity of steel at less than the ordinary price for the sake of enabling one of the other companies to fill a large order or to secure some new foreign market. The National Steel Company is anxious to increase its tonnage and to run its mills at full capacity, which lowers the cost of production. The American Steel Hoop Company also has close relations with the Carnegie Company, from which it buys considerable amounts of steel. (957.)

FEDERAL STEEL COMPANY.

WITNESSES.

	Page.
Stetson, F. S., counselor at law	960-982
Gary, E. H., president of Federal Steel Company	982-1003

I. ORGANIZATION, CAPITALIZATION, ETC.

A. Description of business.—Mr. GARY states that the Federal Steel Company owns all the capital of the Minnesota Iron Company, the Illinois Steel Company, the Lorain Steel Company, and the Elgin, Joliet and Eastern Railroad Company.

The Minnesota Iron Company is the owner of 150,000 acres of iron ore property on the Vermilion and Mesaba ranges. It owns the Duluth and Iron Range Railroad Company, connecting its mines with Lake Superior at Two Harbors and Duluth. It owns large ore docks and also 22 steel lake vessels capable of carrying 2,000,000 tons per annum. The product of the Minnesota Iron Company will probably be 8,500,000 tons in 1900.

The Lorain Steel Company manufactures chiefly steel rails for street railways, and to some extent steel billets. It produces about 500,000 tons of pig iron per year. It also owns the stock of the Johnson Company at Johnstown, Pa., which is chiefly engaged in manufacturing frog switches and crossings for street railroads, also electric motors.

The Illinois Steel Company has plants at North Chicago, West Chicago, South Chicago, Milwaukee, and Joliet. It produces about 1,500,000 tons of pig iron per year, and also manufactures steel rails, billets, plates, etc. It owns the Chicago, Lake Shore and Eastern Railway, which connects its plants in the neighborhood of Chicago. It also owns large tracts of coal property in Pennsylvania and West Virginia, and makes there about 1,500,000 tons of coke per year. This company also owns iron mines in Wisconsin and Michigan.

The Elgin, Joliet and Eastern Railroad Company is called the Outer Belt Line of Chicago, running around the city at a distance of about 30 miles from its center. (982, 984, 985.)

B. Form of organization.—Provisions of charter.—1. *General.*—Mr. STETSON, a lawyer who drafted the charter and conducted the legal arrangements in the organization of the Federal Steel Company, testified that it was organized in September, 1898, with an authorized capital of \$100,000,000 6 per cent noncumulative preferred stock and \$100,000,000 common stock. Of this, \$98,000,000 in all was originally issued.

The purpose of the combination was to acquire, not the property, but a majority at least of the stocks, of the Minnesota Iron Company, the Illinois Steel Company, and the Elgin, Joliet and Eastern Railway Company. Practically all of the shares of these companies were actually acquired. (969, 970.)

2. *Rights of stockholders and directors.*—The articles of incorporation of the Federal Steel Company provide that the board of directors shall determine to what extent the acts and books of the corporation shall be open to the stockholders; the stockholders have no right of inspection except as conferred by statute or by the board of directors or by resolution of the stockholders. Mr.

Stetson explains that the purpose of this provision is merely to shut off any indefinite or common-law right of inspection, leaving the definition of that right, aside from the statutory provision, to be determined by the corporation itself. It is very difficult for administrative officers of a corporation, often mere clerks, to know who shall be recognized and what information shall be granted. The right should be clearly and definitely set forth. Stockholders should have access to the stock and transfer books, subject only to the restriction that the inspection shall be at a convenient time. (971, 974.)

Mr. GARY testifies that the Federal Steel Company has at times been unreasonably annoyed by inquiries from stockholders, its stock being largely distributed, but it has sought to give whatever information was desired if available. He does not consider that the New Jersey laws are calculated to work disadvantage to stockholders. (996.)

3. *Purchase of stock by corporation.*—The articles of incorporation of the Federal Steel Company authorize the directors to buy any stocks of the company with surplus earnings or accumulated profits. This is not a usual provision, but it is allowed by the laws of New Jersey. It is entirely improper, in the opinion of Mr. Stetson, that corporate funds, other than surplus, should be paid to stockholders under the guise of buying stock. But when the surplus is thus used it is simply a more convenient method of reducing capital, which is permitted by all laws. (971, 972.)

4. *Power of directors to increase numbers.*—The charter further provides that the directors may increase their own number and elect additional directors until the next meeting of the stockholders. Mr. Stetson explains that this provision is desirable, even though it does somewhat limit the power of stockholders and increase that of directors. It is fair to the stockholders because they agree to it. When a corporation is first started the preliminary work can be most conveniently done by a small directorate. Afterwards the organization should be completed and the number of directors increased, and it is inconvenient to call a stockholders' meeting for this purpose. (972.)

5. *New Jersey law.*—Mr. GARY, president of the Federal Steel Company, states that it was incorporated in New Jersey because the laws there seemed to give all the powers which were absolutely needed, which was not true of the laws of most other States. Thus, in Illinois a manufacturing corporation can not hold the stocks of other corporations; in Pennsylvania and West Virginia the amount of capitalization is limited. The witness knows of no provision in the New Jersey law especially to the disadvantage of stockholders. There are doubtless illegal practices under the New Jersey law, but the same is true of other States. The Federal Steel Company certainly had only honest intentions in incorporating there. (996.)

Mr. STETSON refers to the same and other reasons why New Jersey was preferred to other States. (971; see also below, p. [?].)

6. *History of organization.*—Mr. GARY testifies that the Federal Steel Company made a contract with J. P. Morgan & Co. to deliver to the steel company stocks of the three original constituent companies, together with a certain amount of cash. In exchange the steel company was to issue to J. P. Morgan & Co. or to the stockholders of the separate companies a certain amount of its stock. Mr. Gary insists especially that no large payments were made to the promoters and that it was intended to issue stock of the Federal Steel Company on the basis of the actual value of the properties acquired.

Mr. Gary submitted later a copy of the original contract made with J. P. Morgan & Co. as managers of a syndicate. This provides that at least two-thirds of the shares of the separate companies must be acquired and that with the shares the stockholders must supply a certain amount of cash. Each share of the Minnesota Iron Company, on payment of \$27.10 in cash, was to receive 135.5 per cent of preferred stock of the Federal Steel Company and 108.4 per cent of common stock. Each share of the Illinois Steel Company, on payment of \$20 in cash, was to receive 100 per cent in preferred stock and 80 per cent in common stock. Each share of the Elgin Company, on paying \$17.50 in cash, was to receive 87.5 per cent in preferred stock and 70 per cent in common stock of the Federal Steel Company. J. P. Morgan & Co. agreed to secure altogether \$14,075,000 in cash, a syndicate being formed to supply whatever cash was not secured from the stockholders under the terms of the above arrangement.

As a matter of fact, J. P. Morgan & Co. succeeded in obtaining practically all of the shares outstanding of each of these companies. The capital stock of the Minnesota Iron Company was \$16,500,000; of the Illinois Steel Company, \$18,650,000; of the Elgin, Joliet and Eastern Railway Company, \$6,000,000. The Lorain Steel Company entered the combination later, its capital stock being

\$12,000,000. The total amount of stock issued by the Federal Steel Company was somewhat over \$58,000,000 preferred and \$46,000,000 common. The profit made by J. P. Morgan & Co., according to Mr. Gary, "in making this exchange and doing this business," was about \$200,000. Mr. Gary believes, however, that J. P. Morgan & Co. already controlled a majority of the stock of these several constituent companies when they made the organization contract. (Their actual profit on the whole transaction, therefore, may have been much greater than their nominal commission.) (986-989, 992, 1008.)

D. Value of properties.—Mr. GARY states further that the properties acquired by the Federal Steel Company were estimated to be worth the entire amount of stock issued, including both preferred and common stock. The book values of the different plants which entered the combination, minus their bonded debts, amounted to about \$45,000,000. These book values are the cost values of construction, purchases, etc. Besides, the separate companies had on hand about \$10,000,000 in cash. The property held, especially mining lands, had increased in value above the amount of original cost entered on the books by about \$31,000,000, making the total value of the properties acquired by the Federal Steel Company \$86,000,000. In addition, \$14,075,000 in cash was obtained by the arrangement with the syndicate above described.

In explanation of the increase in the values of lands referred to, Mr. Gary states that the Illinois Steel Company owned one particular tract of coal lands of 1,132 acres, which cost about \$500 per acre. It has recently been sold for about \$1,000 per acre. The Illinois Steel Company had one iron mine that cost about \$75,000, for which it has recently been offered \$800,000. The Minnesota Iron Company has one mine which is estimated to contain about 25,000,000 tons of iron ore; on this basis its value is from \$10,000,000 to \$15,000,000 greater than its original cost.

The value of the different properties was carefully investigated by experts in determining the proportion of stocks of the Federal Steel Company which should be issued in exchange for the stocks of the separate companies. The investigation was made on behalf of the organizers of the Federal Steel Company itself, and also on behalf of the separate companies, since their interests after entering the combination would be affected by the values of the other plants. The companies were jealous of one another. (986, 987.)

The sources of income of the Federal Steel Company are dividends on the stocks of the underlying companies, interest on its cash in hand, and profits on coal lands bought since the company was formed, in which about \$2,000,000 has been invested. (995.)

Bonded debt.—The total bonded indebtedness of the several companies controlled by the Federal Steel Company, deducting the amount of bonds held by the companies themselves, is \$26,468,000. The figures are shown in detail in a statement submitted by Mr. Gary. The Federal Steel Company did not guarantee the payment of these bonds, nor does it hold any part of them. The amount of indebtedness, however, was deducted in estimating the values of the plants at the time of the purchase of their stocks. (992, 993.)

E. Further issues of stock.—About \$100,000,000 of the authorized capital stock of the Federal Steel Company remains unissued. It is provided that this may be issued only at par, for cash or properties at actual value. (993.)

F. Dividends.—The Federal Steel Company has so far (October, 1899) paid two dividends of $1\frac{1}{2}$ per cent upon its preferred stock. A dividend was declared upon the common stock, but was enjoined by some stockholders on the technical ground that dividends could not be paid until the end of the year. Money has been set aside for this dividend. Mr. Gary believes that this suit was brought for stock-jobbing purposes and not in the real interest of stockholders. The price of stock went down to some extent as the result. The witness is sure that none of the directors of the company had anything to do with the bringing of the suits or bought a single share of the stock during the depression of prices which followed. There are in fact no speculators in the directory of the company, although some of the directors have from time to time bought stocks when they were low. (998, 996.)

G. Nature of combination.—1. *Not a "trust."*—Mr. GARY states that the Federal Steel Company is not a trust in any sense. It has not sought to restrict competition and has not brought together companies which were competing with one another, as is the case with most so-called trusts. The company has bought the stocks of companies doing different lines of business, just as an individual might do. Nor are the directors of the Federal Steel Company trustees in any sense. They are not bound to consider the interests of any other corporation than their

own, but exercise the same control over the constituent companies that any majority stockholder in those companies might do.

There are 15 directors of the Federal Steel Company. These do not control a majority of the stock of that company, nor did they before the consolidation control a majority of the stocks of the separate companies. Some of them in fact were small holders of the stocks or were not interested at all. There is no secret arrangement between the separate companies, but the Federal Steel Company owns their stock absolutely and openly. (988, 989, 990, 994, 995.)

Mr. Gary considers the method of organization and control adopted, by ownership of stock and consequent indirect control of properties, as economical and advantageous as outright purchase of properties. The officers of the subordinate companies are not mere honorary men, but practically hard-working superintendents. (995.)

2. Relations of constituent companies.—Mr. GARY testifies that the officers of the Federal Steel Company have no direct control over the affairs of the separate companies whose stock it owns, aside from the power to elect directors at the annual meetings. Of course the existence of this power brings the officers of the Federal Steel Company into close relation with the officers of the separate companies, and there is frequent consultation as to the methods of business, just as would naturally be the case if any individual held practically the entire stock of a corporation. The directors of the constituent companies are not identical. The separate companies work in harmony, securing supplies from one another, and to some extent adjusting their production so as to make the total as economical as possible. Nevertheless the separate companies contract with one another as independent corporations, and do not always give one another preference as compared with outside parties. Each company is anxious to make its own earnings as large as possible, if for no other reason, in order to make a good showing. If the Illinois Steel Company desires to purchase ore, it will get it wherever it can get it cheapest, whether from the Minnesota Iron Company or elsewhere. So, too, the Minnesota Iron Company sells to the highest bidder, and would not furnish ore to the Illinois Steel Company at less than it could get elsewhere. As a matter of fact the Minnesota Iron Company has sold during the past year not quite half of its production to the steel companies connected with the Federal Steel Company. The Illinois Steel Company buys more ore from others than from the Minnesota Iron Company, for the reason that the production of the latter is of very high grade, while the steel company can mix cheaper ores in part with this high-grade ore. (985, 988, 989, 994, 995.)

II. OUTPUT AND PRICES.

A. Control of output.—Mr. GARY emphasizes the fact that the Federal Steel Company does not attempt to control all or a very large proportion of the output in any of its lines, nor is it in any way able to do so. The Illinois Steel Company produces about 30 per cent of the steel rails of the country. It makes perhaps one-tenth of the coke produced in the country. The Illinois Steel Company and the Lorain Steel Company together produce about 2,000,000 tons of pig iron out of a total annual production of 14,000,000 or 15,000,000 tons. (985.)

B. Prices.—Mr. GARY points out that the rise in prices of steel products has not been greater than that in the prices of raw materials. Although the Federal Steel Company produces much pig iron, it also buys large quantities, and the price has increased from about \$11 a year ago to \$22.50 or \$23. Coke formerly cost about \$1.50 per ton, but the Federal Steel Company is now buying it at from \$2.50 to \$3 per ton. Rails have risen from \$18 to \$33. It costs about \$8 or \$9 to convert a ton of pig iron into rails, so that little is now left for return upon the investment.

Although the Federal Steel Company has had some advantage during the past year in having contracts for ore at a low price, at the same time it had large contracts for finished products at less than the present prices. Over one-half of the rails manufactured during 1899 were sold at a low contract figure. (990.)

III. ECONOMIES OF COMBINATION.

A. Saving of official salaries.—Mr. GARY testified that considerable economy had been effected through the displacement of unnecessary officers in the companies entering the Federal Steel Company, and to some extent by the reduction of salaries of officers not dispensed with. A table submitted by the witness showing the number of employees of all classes in 1898 and 1899, together with the comparative wages, indicates an increase of 4.76 per cent in the number of officers

and clerks, but a decrease of 6.26 per cent in their average daily pay, and a slight decrease in the total expenditures. In view of the increase in the number of laborers and the amount of business, this is considered a noticeable saving. (983, 991.)

B. Improvement in methods.—It is expected also that by bringing together plants having different methods and managed by individuals having different information and forms of skill, the best advantages can be utilized in all the plants. (984, 985.)

C. Harmonious action between companies.—The chief advantage secured by bringing together the different companies in the Federal Steel Company is that of establishing a harmony between all the different branches of the steel industry, enabling one concern to handle the business from the beginning to the end, obtaining any profit there may be in any part of the industry. It is not intended to restrict competition or to seek a monopoly in any way. The wants of each of the constituent companies are understood by the others, through the harmonizing influence of the Federal Steel Company, and they cooperate with one another to a certain degree. Thus the Illinois Steel company is protected from a possible lack of material by the ability to get practically all it requires from the Minnesota Iron Company, while the Minnesota Iron Company is protected from a possible surplus by having customers in the Lorain Steel Company and the Illinois Steel Company.

On the other hand, the separate companies are not by any means completely consolidated, nor do the officers of the Federal Steel Company have any direct control over the conduct of the business, further than through the election once a year of the directors. (See pp. 196, 197) (983-986.)

IV. WAGES.

Mr. GARY testifies that there has been a marked increase in wages since the formation of the Federal Steel Company. The number of employees has also been increased. So far there has been no difficulty with labor. The separate companies combined in the Federal Steel Company make their own arrangements with the Amalgamated Association or with nonunion employees. The witness submitted the following table showing the number and compensation of employees in 1898, prior to the formation of the company, and in August, 1899. (983, 991.)

Comparative statement of employees, and wages received by same, of the Federal Steel Company's constituent companies for the months of October, 1898, and August, 1899.

	Number of employees			Average daily compensation.			Total monthly compensation.		
	October, 1898.	August, 1899.	Per cent increase.	October, 1898.	August, 1899.	Per cent increase.	October, 1898.	August, 1899.	Per cent increase.
Officers and clerks at headquarters..	294	306	4.76	\$5.27	\$4.94	-6.26	\$46,525.69	\$45,652.03	-1.88
General superintendence.....	574	630	11.32	2.95	2.97	.68	50,623.30	56,732.10	12.06
Skilled laborers.....	7,405	8,584	15.92	2.32	2.53	9.05	710,099.80	651,349.06	-8.31

Total annual wages paid employees on basis of August, 1899, roll, \$16,721,402.23.

V. TARIFF AND EXPORT TRADE.

Mr. GARY testifies that he believes protection still to be necessary in the steel industry. With regard to each particular class of manufactures inquiry should be made as to the need of protection and the amount of it. Free trade applied to many industries would permit foreign goods to be brought in to the absolute ruin of those industries. Not only would labor thus be injured, but ultimately the foreigner would be able to make his own prices to the injury of the consumer. But if the tariff is so high as to create a monopoly, it has gone too far. The question of the need of protection is intimately connected with that of freight. This country is exporting steel rails to Japan, the tariff on steel products being greater than freight to Japan, but we could not export them to England at present.

Germany is especially to be feared as a competitor in the steel industries. The Germans have ore and coal close together, and can manufacture pig iron, in the opinion of the witness, cheaper than any others. Coke is being made in ovens which utilize all the by-products; these are being put in in this country to some extent. The witness believes that German wages are only 65 or 70 cents a day—very much less than in this country.

Mr. GARY testifies further that although the demand in the United States for steel is so great at present that it is difficult to supply it, he has been inclined to keep up export shipments in order to retain certain markets. The business may be needed 2 or 3 years hence in order to keep up tonnage and employment. The Lorain Steel Company has recently taken a large contract for street-railroad rails in Scotland, while steel has also been shipped recently to Japan at a price below the domestic price. (998, 999, 1001.)

VI. CORPORATION AND POLITICS.

Mr. GARY testifies that the Federal Steel Company has not sought in any way to influence politics or elections, that it has declined to contribute to campaign funds, and that no influence is exercised on the vote of the employees. All of these practices, Mr. Gary thinks, should be discountenanced. (996, 997.)

AMERICAN STEEL AND WIRE COMPANY.**WITNESSES.**

	Page.
Gates, John W., chairman American Steel and Wire Company	1005-1084
Pam, Max, attorney at law	1084-1089

I. ORGANIZATION, CAPITALIZATION, ETC.

A. Description of business.—The American Steel and Wire Company operates iron mines in the Lake Superior region. It controls, perhaps, one-sixth or one-seventh of the output of that region. It owns and operates coal mines and burns coke. It operates 8 or 9 blast furnaces, 17 open-hearth furnaces, from 22 to 25 rod rolling mills, and from 20 to 30 wire mills. Its finished product is plain wire, barbed wire, wire fencing, rope, etc., wire nails, and all kindred articles. The company does not produce all its own raw materials, but buys from 40 to 45 per cent of them.

Probably one-half or two-thirds in value of the stockholders of the American Steel and Wire Company are identical with those of the American Steamship Company, operating ore and grain boats on the Great Lakes. It has, however, so happened that these vessels have, during 1899, carried no ore for the Steel and Wire Company. The manager of the steamship company is directed to earn as much as possible with the boats. (Gates, 1005, 1007.)

B. History of organization.—Mr. GATES, chairman of the American Steel and Wire Company of New Jersey, testified concerning the formation of that company. It was organized on January 12, 1899. A gradual process of consolidating wire plants had been going on previously. As early as 1890 companies in which Mr. Gates was interested practically controlled the manufacture of barbed wire in this country. In December, 1897, and January, 1898, J. P. Morgan & Co. investigated the value of the various wire plants throughout the country with a view to further consolidation. The American Steel and Wire Company of Illinois, formed in March, 1898, seems to have resulted from this effort. Mr. Gates,

chairman of the American Steel and Wire Company of Illinois, in conjunction with Mr. Ellwood, bought during December, 1898, a number of wire mills, and took options on others. The thought of complete consolidation was apparently in mind, but these organizers did not know how far the movement would go, and they bought no plant which they were not willing to take irrespective of consolidation. They bought the plants, so far as they themselves carried the matter, outright.

When the possibility of a very general consolidation was shown, Mr. Gates and Mr. Ellwood went to New York and turned over their options to Mr. Voorhees, who carried on the further arrangements for financing the operation. Mr. Ellwood and Mr. Gates became, to quite an extent, the underwriters for the stock of the new company. Ultimately Mr. Voorhees acquired by exchange all of the stocks of the American Steel and Wire Company of Illinois, and either the stocks or the properties of most of the various companies now in the combination. Some plants were bought some time after the organization of the company.

The separate companies were not continued and simply controlled by ownership of stock, but in all cases except perhaps one were dissolved.

The following is the list of plants which now make up the combination: 12 or 14 plants formerly owned by the American Steel and Wire Company of Illinois; Washburn-Moen Company, which had works at Worcester, Mass., Waukegan, Ill., and San Francisco; the Cleveland Rolling Mill Company; the Oliver-Snyder Steel Company, of Pittsburg, formerly called the Hazensworth; the Edith Furnace Company, of Pittsburg; the Oliver Wire Company, of Pittsburg; the wire department of the Shenango Valley Steel Company, of Newcastle; the Pittsburg Wire Company, of Braddock; the Cincinnati Barbed Wire Fence Company, of Cincinnati; the Indiana Wire Fence Company, of Crawfordville, Ind.; the Consolidated Barbed Wire Company, of Lawrence, Kans., and Joliet, Ill.; the wire department of the Portage Iron Company, of Duncansville, Pa.; the Worcester Wire Company, of Worcester, Mass.; the Schoenberger Steel Company, of Pittsburg; the Puget Sound Wire Nail Company, of Everett, Wash.; the Laidlaw Bale and Tie Company, of Joliet and Kansas City; the Newburg Wire Nail Company, of Newburg, N. Y.

Causes.—The combination into the American Steel and Wire Company was not rendered necessary by excessive competition and consequent losses among the wire companies. The Consolidated Steel and Wire Company, for example, made between 27 and 28 per cent during the last 3 years of its existence. It was believed, however, that more profit would be made through better management under consolidation. (1033, 1034.)

D. Capitalization and value of plants.—The capital of the American Steel and Wire Company consists of \$40,000,000 preferred and \$50,000,000 common stock. The various plants consolidated stand on the books at present as having cost the combination about \$75,000,000, and there is a working capital of perhaps \$16,000,000 or \$18,000,000 above that. The value of \$75,000,000 includes the plants as working plants, comprising good will, patents, and everything.

So far as the plants entering the combination were purchased by Mr. Gates and Mr. Ellwood, negotiations were made with each company separately, on as favorable a basis as possible. No company knew what the others were receiving, and the purchasers did not pay more than they were willing to pay, irrespective of any consolidation. Mr. Gates was thoroughly familiar with wire plants, and he himself had priced these plants a year before. He had the figures furnished by accountants employed by J. P. Morgan & Co. previously, giving the profits of these plants for 3 years. Any one of the plants so bought could have been sold at any time since at from 25 to 40 per cent more than was paid.

As to the actual value of the plants as plants, irrespective of good will, Mr. Gates states that competent engineers employed by J. P. Morgan & Co. appraised a year before perhaps 70 per cent of the plants which entered the combination, and their value was estimated at about \$28,000,000. Since then the cost of materials, construction, etc., has increased at least 80 per cent. The witness estimates that the actual value of the plants to-day is probably \$50,000,000 to \$60,000,000, while perhaps \$10,000,000 or \$15,000,000 of the stock issued represents good will, patents, which were numerous, and earning capacity.

Mr. Gates believes that capitalization should be based on earning power rather than any other basis. Good will is valued much more highly in England than in the United States, the capitalization of companies being essentially based on their earnings. If a railway with a certain mileage earns more than another with double the length of line, the first railroad is worth more and may fairly be capitalized for more. Nevertheless there is no necessity for Government regulation of rates or charges, since competition will prevent extortion. (1020, 1021, 1032.)

Mr. GATES afterwards submitted a copy of the notice issued by the directors of the American Steel and Wire Company of Illinois to the stockholders with regard to the formation of the American Steel and Wire Company of New Jersey and the purchase of other plants. The notice states that the new corporation will acquire, either through direct ownership or through the ownership of a majority of the capital stock, various plants enumerated, which have been assured to it on a fair basis. A syndicate has been formed which will furnish the necessary capital for these purchases, in addition providing a working capital of about \$18,000,000, exclusive of the working capital of the several concerns, the total amount of capital to be furnished by the syndicate being \$28,000,000. Arrangements have been made for the exchange of the stock of the New Jersey company for that of the American Steel and Wire Company of Illinois, provided a majority be offered, on the basis of one share of preferred stock and six-tenths of one share of common stock of the New Jersey corporation for each share of the preferred stock of the Illinois corporation, and 1.2 shares of the common stock of the New Jersey company for each share of the common stock of the other. The transfer was made through J. & W. Seligman & Co., of New York, and the Illinois Trust and Savings Bank, of Chicago, as the agents of that company. (1019, 1030.)

E. Dividends.—Mr. GATES states that the American Steel and Wire Company has earned a good dividend on its common stock, but that the directors have not voted a dividend, believing that it is desirable to acquire additional properties, and to put all of the properties in shape, so that when the present unusual prosperity has subsided, dividends can be regularly paid. (1034.)

I. EFFECT ON OUTPUT AND PRICES.

A. Control of output.—Mr. GATES testifies that the American Steel and Wire Company produces from 75 to 90 or 95 per cent of the steel rods and smooth wire (the basis of wire nails, etc.) manufactured in this country. The combination owns 2 rod mills, while there are 5 large rod mills outside, 3 belonging to the Federal Steel Company. The American Steel and Wire Company produces about the same proportion—65 to 95 per cent—of wire nails. It has practically a monopoly of the manufacture of barbed wire and wire fence, by ownership of all the patents on these goods and on the machinery used in making them. There are, however, two or three concerns which manufacture barbed wire under a license, and these have no agreement as to prices.

Mr. Gates states that the American Steel and Wire Company has not sought to limit competition or to acquire a monopoly. It is true that the company, owing to its superior advantages, can undersell most smaller manufacturers. Some of these, such as the manufacturers of woven-wire fencing, have been furnished the finished product by the American Steel and Wire Company to fill their orders, at prices which enable them to make a good profit. Many of the smaller manufacturers have not the facilities for making steel, or perhaps for making rods. They compete simply in the finished products—nails, etc.—and may buy rods and wire from the American Steel and Wire Company. In such cases the combination makes no agreement as to the prices to be maintained for the finished products, nor does it in any way seek to injure or restrict these competitors. Moreover, they can readily obtain their raw material from other sources.

The American Steel and Wire Company makes no discriminations in charges as between different buyers, except on the basis of the quantity purchased. The price for carload lots is 15 cents per keg less than on part carloads, while the jobber's price on larger quantities than the carload is 15 cents lower still.

There is no monopoly of wire-nail machinery or other machinery, excepting for barbed wire and woven wire. The machinery is not for the most part patented, and can be made by any machine shop, since it is not difficult to manufacture.

Mr. Gates believes, however, that the combination has a certain advantage in securing trade, owing to the fact that large buyers believe that by keeping up their trade with the combination they will be more certain of securing a supply at reasonable prices in case of a tight in business, of shortage, etc. (1005, 1010, 1011, 1022-1024.)

B. Closing of plants.—The American Steel and Wire Company has closed 5 of the plants which it obtained at the formation of the combination, at Duncansville, Pa., Puget Sound, Crawfordsville, Lawrence, Kans., and Cincinnati. A plant at Newburg, N. Y., was closed at the time it was bought. Apparently some plants owned by the former American Steel and Wire Company of Illinois were closed earlier. Mr. Gates states that the reasons for buying plants which were afterwards closed were special in each case. For example, the Puget Sound company had a contract

to buy a large quantity of raw material at a very low price. Several hundred thousand dollars were made by securing that contract through buying the plant. The Crawfordsville plant had a similar contract with the American Steel and Wire Company which would have been very expensive for the latter to fill. The Newburg Wire Nail Company was bought in order to prevent complications as to patents.

The closing of the plants was due in every case to lack of economy in their operation. Sometimes they were badly located, sometimes badly constructed, sometimes both. It might, perhaps, pay to operate them at the present high prices if raw material could be obtained. Part of the plants have been dismantled and their machinery shipped elsewhere, while others could be reopened. The company is producing as rapidly as possible, and has increased its output for 1899 by 15 to 20 per cent as compared with 1898. (1028, 1029.)

C. Prices.—1. *Generally.*—Mr. GATES testifies that the increase in the price of smooth wire and of wire nails since the formation of the American Steel and Wire Company has been caused chiefly by the higher price of raw materials and of labor. The increase in barbed wire and woven wire fence has been greater, owing to the practical monopoly which the combination enjoys through patents.

The company, although it manufactures part of its own pig iron and steel, buys more than half of these products. The price of pig iron has increased from \$9 to \$24 per ton within the past 2 years. The price of wire meantime has increased perhaps 125 or 150 per cent, and that of wire nails about the same.

It is not just to compare simply the price of raw material with the price of the finished product by taking the difference at different prices. There is a waste of 8 per cent, perhaps, in rolling steel. If billets cost \$15 per ton the loss is \$1.20; if they cost \$35 per ton the loss is \$3.80, which makes this item very much more important as raw material increases in cost.

2. *Barbed wire.*—As to barbed wire, Mr. Gates admits that the combination has a practical monopoly, and that it keeps the price higher than would perhaps be the case under free competition. But this higher price is largely justified by the exceedingly large payments which the combination has made for patents on barbed-wire and machinery. Even as it is, the prices of barbed wire have decreased immensely as compared with 15 or 20 years ago, and they have even dropped 50 or 60 per cent since 1890, although companies with which Mr. Gates has been interested have practically controlled the manufacture of barbed wire since that date.

It is the practice of a large concern which has a practical monopoly not to handle the business so as to "crowd the mourners." It would be bad policy to try to make so much money in 6 months as to ruin the business for the next 12 or 18 months. By increasing the output, greater profits can be obtained. What was thought a fair rate per 100 pounds on barbed wire a few years ago is now a very high price on account of the increased tonnage.

So far as outside manufacturers are making barbed wire under license from the combination, no agreement is made with them for maintaining prices. (1008, 1009, 1032, 1033.)

D. Raw materials.—In fuller support of his statement concerning the increase in the price of raw materials, Mr. GATES points out that the value of iron ore at the mines stood at about \$2.75 per ton, on the basis of Norrie ore, in 1897, at \$2.80 in 1898, and at from \$2.90 to \$3 in 1899. These latter prices were chiefly fixed by contract during the winter of 1898-99, before the great increase in demand was known. For 1900 the manufacturers will probably be willing to pay as high as \$5.50 per ton. There was never before 1899 produced in this country more than 10,000,000 tons of pig iron in any year, while the output for 1899 will probably be more than 13,000,000 tons. Until 1899 the value of ore in the ground was not considered more than, at the outside, 40 cents or 50 cents per ton. Mines can now be sold on the basis of about \$2 per ton. Before 1899 the largest output of ore from the Lake Superior district in any year was perhaps 13,000,000 tons. In 1899 it is likely to prove 16,000,000 or 17,000,000 tons, and the prospects are that it may reach 20,000,000 tons in 1900.

Lake freight rates have also increased materially during 1899, although they have varied greatly in different cases according to previous contracts. The rates from the head of Lake Superior to lower lake ports were as low as 45 cents or 50 cents per ton during 1896, and did not rise above 70 cents per ton during 1897 and 1898. The charges have ranged during 1899 from 60 cents to \$2. The witness believes the actual cost of lake transportation averages not less than 60 cents per ton.

The cost of transporting ore from Lake Erie ports to Pittsburg, where a large proportion of the mills of the American Steel and Wire Company are located, is about 80 cents per ton.

The American Steel and Wire Company buys more than half of the steel which it uses. It is a large buyer of what is known as soft steel, containing 0.04 to 0.10 per cent of carbon. In the past the company has been able to buy this steel at from \$13.50 to \$16 per ton. The last purchases have been at \$32 per ton, while considerable steel has been bought during 1899 at \$48 and \$50 per ton. The company has sold finished product at \$40 per ton where the raw material, the steel, cost \$50 per ton. These special cases have been due to existing contracts with manufacturing companies. On the whole, Mr. Gates believes that manufacturers of wire and other steel products have not made nearly as much profit from the advance in prices as the public has been led to believe.

In explanation of the general increase in the price of steel and steel products, Mr. Gates states that there has been an immense increase in consumption and demand for various purposes, and there has not been enough steel to go around. The shipbuilding business has never been so active, and those building vessels have been compelled to pay exceedingly high prices, often resulting in losses. The witness knows of ships part of whose steel plates have cost \$1.20, and others as high as \$3, on account of the change in prices. Again, up to 2 or 3 years ago railways transported goods mostly in cars containing only 15 or 20 tons; now they are using cars that carry 50 or 60 tons, and have increased the maximum train loads from perhaps 800 tons to 2,000 tons. These changes necessitate heavier cars, locomotives, rails, and bridges. There are 5,000 miles of railways laid with 60 to 70 pound rails, which must be replaced with 75 to 100 pound rails. The construction of steel cars is practically a new thing, but during 1899 nearly a thousand tons of plate are being used daily for this purpose. The increased demand for steel in erecting buildings is also noteworthy. Mr. Gates believes that the steel used in making cars, vessels, buildings, and bridges to-day is equal to the total output of iron and steel in the United States 15 or 20 years ago. On account of these large demands for steel, which are not likely to decrease soon, Mr. Gates believes that prices will not probably fall materially for at least 2 or 3 years. (1006, 1007.)

E. Control of iron and steel output.—Mr. GATES, chairman of the American Steel and Wire Company, testifies that there is no combination or agreement between the 4 leading iron and steel companies—the Carnegie, Federal, National, and American Steel and Wire companies. It is true that Mr. Gary, now president of the Federal Steel Company, was formerly interested in the wire company, but there is no common interest, nor to any large extent common ownership. The American Steel and Wire Company buys steel from all of the other companies, being perhaps the largest customer of the Carnegie and Federal companies.

Nor do these 4 companies together control the entire production of iron and steel. As to iron mines, their interests are confined to the Lake Superior region, while most of the more eastern manufacturers in this country are supplied from the Lake Champlain, Cuban, and Spanish mines. The ore production of our Southern States is large and growing, and is to a considerable extent owned by the iron manufacturers of the South independent of the 4 great companies. Mr. Gates estimates that these 4 companies produce 60 per cent of the total ore output of the United States in 1899.

Mr. Gates does not believe that more than 30 or 40 per cent of the iron furnaces in the country are owned by the Carnegie, Federal, National, and American Steel and Wire companies. Perhaps 80 per cent of the Bessemer steel business is controlled by them, and 50 or 60 per cent of the open-hearth steel. (1022, 1023, 1027.)

III. ECONOMIES OF COMBINATION.

A. Reduction in officers and salaries.—Mr. GATES stated that a considerable saving had been effected by doing away with the official organizations of the separate plants entering the American Steel and Wire combination. Each plant formerly had its president, vice-presidents, managers, and other officers. These have been largely done away with, the business being put in charge of officers in New York and Chicago, while the operation of the plants is under the control of district superintendents. Perhaps 50 per cent of the high-priced officers have been dispensed with. The company has also dispensed with about 200 traveling men.

B. Freights.—The buyers of the products of the American Steel and Wire Company will be furnished with goods from the nearest plants, effecting a saving of cross freights, which Mr. Gates believes will amount to \$500,000 or even \$1,000,000 a year. The company, however, receives no special rates, rebates, or commissions in view of its large shipments. It pays the regular schedule rates.

C. Patents.—The chief advantage as regards the common ownership of patents brought about by the combination is the avoiding of lawsuits, which were formerly numerous.

D. Bad debts.—The centralization of the business in one company enables greater pressure to be brought to bear upon purchasers and greater care to be exercised to prevent bad debts. Formerly a merchant might buy from and quibble with half a dozen manufacturers, and so secure goods on credit, without paying for them. The witness believes that the percentage of loss from bad debts has been reduced from one-half of one per cent to one-twenty-fifth of one per cent.

E. Combination of different branches of industry.—Great advantage is also expected, especially when the company is more developed and its plans are more fully carried out, from its control of different branches of the industry—mines, transportation, steel, etc. The company will always be certain of its supplies of raw material, and can thus operate more certainly and economically. (1030, 1031.)

IV. WAGES.

Mr. GATES testifies that the American Steel and Wire Company is paying about 40 per cent higher wages now than the constituent companies were paying before the combination. The company has made two advances of 15 per cent each and one of 10 per cent, he believes. The men who roll steel are paid on a sliding scale, and the increase in the price of the output has very greatly raised their wages.

The average advance has been fully 40 per cent, while in some cases it would be 150 per cent. The American Steel and Wire Company does not recognize the Amalgamated Association of Iron and Steel Workers. It makes agreements with committees representing the men in the individual mills, these agreements running usually through the year. The company makes no distinction between union and nonunion men, but pays all the same wages. The scales fixed to a considerable extent follow those adopted by the Amalgamated Association in other mills, so far as they apply to similar classes of work. The witness believes that since the organization of the present company there has been no proposition on the part of the Amalgamated Association to deal with this company, but if such a proposition were made it would be refused.

The wages paid to the miners of iron and coal employed by the combination, as well as the coke burners, are at whatever rates prevail at the time in the district. (1011, 1013.)

V. TARIFF AND FOREIGN TRADE.

A. Need of protection.—Mr. GATES believes that the protection of wire rods and other wire products has been highly beneficial in building up the industry and in increasing employment. When the duty was first asked for in 1888, perhaps 40 or 50 per cent of the wire rods used in the United States were manufactured here, the remainder being imported. To-day America exports a great many wire rods and similar products, and imports practically none.

The witness believes that protection is still needed for this industry. The necessity of protection is intimately bound up with the amount of transportation charges. The wages paid in the wire industry in this country, Mr. Gates believes, are from 60 to 85 per cent more than in Europe. This is due to the fact that American laborers have a higher standard of living, not to the greater cost of living, which Mr. Gates specifically denies to exist.

Germany is the chief competitor of the United States in steel products, and this country has a great advantage over Germany. Thus, the cost of a ton of coke in Germany is \$5, while until recently it was about \$1.50 in the United States. The cost of ore here is also less, while American railroads are the cheapest transporters in the world. Nevertheless, German producers have special advantages through the aid of the government. The government-owned railways favor export business by charging perhaps one-tenth as much per ton per mile for goods intended for export as for those employed within the country. Moreover, the German manufacturers (apparently of wire rods) receive a subsidy, according to Mr. Gates, of \$7.25 on every ton of goods they export, that subsidy being made up by various allied lines of manufacturing, in order to encourage the export business.

Other countries also favor their export trade by subsidizing steamship and mail lines, while the absence of an American merchant marine makes ocean freight rates from this country higher than those enjoyed by European countries. Thus until recently shipments of wire from New York to Argentina have been made by way of England, because the rates from London and Liverpool were so much lower than from New York direct. The rates from German ports to Brazil are also especially low.

B. Export trade and prices.—The exports of wire products have been materially increased by the combination. Thus in 1898 they amounted to less than 100,000 tons; in 1899 they will be more than 200,000 tons. Systematic efforts have been made to secure business. The combination has a very large trade in China and Japan. Thus during the month of August the Chinese trade was larger than that with any other country. Shipments to the Orient are mostly overland to the Pacific coast, the railways making favorable rates. Exports to England have been increasing with great rapidity, the company doing an average business in London of \$15,000 to \$20,000 per day, and selling perhaps 60 per cent of all the wire used in Great Britain.

The price at which the American Steel and Wire Company is selling in foreign markets at present is less than the domestic price. The reason for this is that by working up a permanent foreign business the company can assure the constant operation of its mills and thus make goods cheaper, and can make profits from maintaining foreign prices at times when there is a decline in the home price. By manufacturing perhaps 200,000 tons of wire per annum for export, the entire cost of manufacture can be materially cheapened and in the long run the domestic consumer will receive a lower price. The prices at home and abroad are entirely independent of one another, varying according to the local demand and the cost of raw material in each place, and the competition. The business is run to get the largest net profit and the largest tonnage. (1014-1017.)

C. Syndicates in Europe.—Mr. GATES further testifies that the manufacturers of practically all classes of steel products in Germany are united in syndicates, with formal written agreements for dividing output and maintaining prices. These agreements are legal under the German laws and can be enforced. Thus the coke men have a syndicate, the coal miners a syndicate, the pig-iron makers, rod makers, wire makers, nail makers, etc., separate syndicates. Each combination has a general agent who practically does the selling for all the different manufacturers. The idea of these manufacturers is that they have really but one competitor to be considered, the United States, and they work in harmony in order to protect their export business. As a rule their prices are from 30 to 35 per cent higher to the home trade than to the foreign trade. The different classes of steel industries are also more or less associated together.

The witness believes that the government of Germany exercises quite thorough supervision over these combinations, both for the purpose of taxation and for the purpose of encouraging manufacture and especially export trade. The witness does not understand the exact nature of this supervision.

Mr. Gates also believes that English manufacturers of wire products are quite thoroughly organized, although England is not an important competitor in the wire business. (1017, 1018.)

D. International combination.—During 1899 Mr. GATES went to Germany and other countries of Europe and conferred with wire makers there with a purpose of forming an agreement for dividing the tonnage of wire products in the entire world between the different countries on an equitable basis, and of maintaining prices. Mr. Gates desired to secure 50 per cent of the business to the American combination, but was only offered 45 per cent, and moreover became distrustful, so that the negotiations were dropped, and there is no thought of proceeding further with the matter. The Germans, also, wished to increase prices by \$30 per ton, while Mr. Gates thought \$10 per ton sufficient. (1017, 1018, 1024.)

NATIONAL SHEAR COMPANY.

WITNESSES.

	Page.
Pearson, James C., private banker	1041-1043
Wiss, F. C. J., vice-president National Shear Company	1043-1047

A. Organization.—Mr. WISS, vice-president of the National Shear Company, testifies that it was organized in September, 1898. The combination was formed largely under the influence of Mr. J. H. Parks, in association with Mr. J. H. Claus, of the Claus Shear Company. At first it was attempted to form an agreement between the manufacturers at meetings, but this having failed, the promoters took it upon themselves to secure options on the factories of the principal manufacturers. The witness, like other manufacturers, knew that a combination was

being sought, but did not know definitely what others were going in, nor concerning the amount of capitalization. He was led to believe that options had been secured on all the principal plants, and that these options would be exercised. The promoters, he understands, issued all the stock to themselves, with the proviso that if they should not succeed in turning over certain factories to the company, a proportion of it should revert to the treasury. In the case of the owners of the separate plants, it was merely a question of selling outright. They did not know how much the other plants received. Mr. Wiss demanded for his plant a certain amount of cash, but when this was not forthcoming and a proportion of stock was offered, he finally accepted in payment a certain amount of cash, a certain amount of notes of the company, and some stock in addition, with the option to take stock for any portion of the other consideration.

The witness believes that options were secured originally on plants controlling between 80 and 90 per cent of the output of shears in this country, but these were not all exercised, and the combination is apparently, in his opinion, not as satisfactory an organization as was expected. (1043-1047.)

B. Capitalization, value of plants, etc.—Mr. Wiss further testifies that the amount of capital authorized was \$1,000,000 preferred stock and \$2,000,000 common stock. Of the preferred stock \$955,000 has been issued, the total issue of both classes being \$2,410,000.

The witness believes that the net value of the plants which actually entered the concern, exclusive of quick assets, is probably \$500,000 at the present time. Two of the factories have been closed down and the machinery taken out, and the value of these is very slight.

The company has so far paid no dividends, even on its preferred stock, and Mr. Wiss does not believe the stocks would find purchasers, even if listed on the market. (1044, 1047.)

Mr. PEARSON, a private banker of Boston, confirmed some of the details stated by Mr. Wiss. He added that it was his understanding that the company was practically organized on borrowed money, and that the plants which came into it were largely paid for by notes of the company itself, or by cash secured upon notes to the witness. Mr. Pearson made a private arrangement with the promoters of the company to discount their notes at 6 per cent interest to the amount of \$200,000. If he continued to discount these notes he was to receive after 9 months a certain amount of stock of the company; and after 18 months an additional amount. The amount due after 18 months was to be \$30,000 preferred stock and \$225,000 common stock; after 9 months a little less than one-half was payable. The stock was issued in the names of friends of Mr. Pearson, and held in escrow. At the end of the first 9 months, not being satisfied with the way the company was doing business, Mr. Pearson abandoned the arrangement, but the stock which was then due to him was not handed over. He believes that the notes are good. He is satisfied that the money obtained on these notes was practically all the working capital, aside from stock on hand, which the company possessed, and that part, at least, of it was paid to other factories for entering the combination. He had been inclined at the outset to believe that the venture was rather unsound, which is the reason for the insertion of the 9 months' clause. (1041-1043.)

C. Output and prices.—Mr. Wiss testifies that 5 shear companies are at present in the combination. The output is probably 60 per cent of the total produced in this country. There are 4 or 5 other companies outside of the combination, the largest being the Heinisch & Sons Company.

During the 8 years preceding the formation of the combination, there had been exceedingly fierce competition, which had reduced prices. The competition of two of the concerns was scarcely legitimate, since they had failed in business and were paying a mere nominal dividend to their creditors.

Since the organization was formed prices have been advanced to certain customers, although the witness understands that concessions have been made since that time. He is not himself familiar with the selling business nor an active manager of the plant in which he was formerly interested. The increased cost of raw material has to be considered, although the value of the material compared with the labor entering the finished product is relatively small. There has been an advance in wages since the advance in prices. (1044, 1045.)

D. Economies of combination.—Mr. Wiss believes that some economy should be made in the business by the combination. Patents are relatively unimportant, and as yet he knows of no specialization of work in particular plants, each of the establishments running practically as it did before. There should be advantages in the cost of administration and of selling, in buying material, and in adopting at the different works the advantages of each other. (1045.)

E. Tariff.—Mr. Wiss states that the shears manufactured in this country are mostly of larger size than those imported, there being no attempt of American manufacturers to compete with the smaller imported scissors. Probably 90 per cent of all the scissors under six inches long sold in this country are imported. Without protection, however, the witness believes that many of the larger shears would also be imported.

The tariff led to great increase of competition in the hope of securing profits from protection, and has thus indirectly brought about the present combination. (1046.)

INTERNATIONAL SILVER COMPANY.

WITNESSES.

	Page.
Dodd, Samuel, president International Silver Company.....	1049-1062
Watrous, William H., director International Silver Company.....	1062-1066
Rogers, N. Burton, independent manufacturer.....	1066-1075

I. ORGANIZATION, CAPITALIZATION, ETC.

A. Description of business.—Mr. DODD, president of the International Silver Company, states that its business consists of the manufacturing of all classes of silver plated ware, including so-called flat ware, knives, forks, spoons, etc., and hollow ware, table ware, etc. The base of hollow ware is pig tin, and of flat ware nickel silver. The company also manufactures a small amount of sterling silver. (1049.)

B. Organization.—The International Silver Company was organized November 21, 1898. Mr. Dodd himself had nothing to do with the organization. The following is a list of the companies which entered the combination: Wilcox Silver Plate Company, Meriden Britannia Company, Meriden Silver Plate Company, in Meriden; Barber Silver Plate Company, William Rogers Manufacturing Company, of Hartford, Conn.; Rogers Bros. and Rogers & Hamilton, of Waterbury, Conn.; Middletown Plate Company, of Middletown, Conn.; Derby Silver Company, of Derby, Conn.; Holmes Edwards Silver Company, of Bridgeport, Conn.; Simpson, Hall & Miller Company, of Wilmington, Conn.; Simpson Nickel Plate Company, of Wilmington, Conn.; Norwich Cutlery Company, of Norwich; Manhattan Silver Company, of Lyons, N. Y.; the Standard Silver Company, of Toronto, Canada; Watrous Manufacturing Company, Warrington, Conn.

These companies, Mr. Dodd points out, are practically all located in Connecticut, and the combination is a sort of "family affair." The different companies have all been acquainted with one another's affairs, and although they have competed vigorously in the past their relations have been more or less friendly.

The International Silver Company has bought outright the plants of all the different companies except the one in Lyons, N. Y., and the one in Canada, and it intends to make its ownership of these complete as soon as necessary legal adjustments can be made. The consideration paid to each company was not known by the others. A certain proportion of cash was paid to each, and a certain proportion of preferred and common stock. The witness, for example, simply told the organizers that he would sell a majority of the stock of his company for such and such a price, provided a certain number of other plants were secured, and provided the total capitalization of the company did not exceed a certain figure. (1051, 1053, 1054.)

Mr. N. B. ROGERS, vice-president of the firm of C. Rogers & Bros., independent silver-plate manufacturers, testifies that negotiations were made some time before the actual incorporation of the International Silver Company. The promoters asked C. Rogers & Bros. to give an option upon their business, on condition that all the other plants which it was proposed to unite should be secured. In connection with the arrangements an investigation of the books of the company was made, which was intended to be confidential. No one company was to know the value of the plants of the others or the amounts paid to them. Each company desired to retain a certain influence, and accordingly was to be represented by a director in the combination. But some of the larger concerns demanded additional directors, and the first attempt to form an organization failed. Some of the companies demanded all cash for their plants and could not secure it.

Later a new combination was made, leaving out three or four of those which had taken part in the previous negotiations. The witness heard that this new combi-

nation had been given by the promoters accurate knowledge as to the results of the examination of the other plants. There have been some suggestions of an indefinite nature to C. Rogers & Bros. since the organization of the company that it would be well for them to enter the combination, but no definite proposal has been made.

Mr. Rogers further states that the options which were given on the different plants were taken by a mere dummy, a clerk in the promoters' office without financial standing, the idea being that there would be no one who could be held in case the movement failed. (1807.)

C. Capitalization.—The authorized capital of the International Silver Company consists of \$9,000,000 preferred stock and \$11,000,000 common stock. The amount of preferred stock issued so far is \$5,111,500; of common stock, \$9,896,000. In addition the company has issued \$3,900,000 of bonds.

Each company made its own arrangement as to the price for its plants and the proportion which each should be paid in cash and in stocks. The Wilcox Silver Plate Company, with which Mr. Dodd was then connected, received for each share of its stock of the par value of \$25, \$25 in cash, \$50 in preferred stock, and \$25 in common stock. This the witness considered a fair value for the plant. In better times the stock of the company had sold at 375 per cent.

Mr. DODD expressed considerable unwillingness to state the cash value of the plants of the combination as compared with the capitalization and with the value of trade-marks and good will. He had no figures or manner of knowing accurately. He finally ventured an opinion that the plants might be worth \$10,000,000 and the trade-marks, patents, etc., as much more. Mr. Dodd is not inclined to use the term "good will" in connection with the business, but attributes high value to the trade-marks of different companies. The International Silver Company bought all the various trade-marks of the constituent companies, such as, for example, the name "Rogers Bros." The public does not care especially for salesmen or for officers of companies as individuals; it has no "good will" toward them; but, for example, the name of the Wilcox Silver Plate Company has come to be known as indicating a high quality of goods. If the same goods were stamped with another name they could not be sold so readily. The establishment of the value of this trade-mark required many years of labor and many thousands of dollars of money. The basis of the value of the stock of the Wilcox Silver Plate Company was its earning capacity rather than anything else.

A later estimate made by Mr. Dodd places the proportion of the property of the International Silver Company represented by the value of plants, machinery, merchandise, etc., at from 45 to 50 per cent. (1054, 1055, 1057, 1059, 1061.)

Mr. ROGERS testifies that the arrangement for the purchase of the plant of C. Rogers & Bros. was that they should be paid \$500,000 in cash, \$300,000 in preferred stock, and \$150,000 in common stock. The latter was understood to be a bonus. The larger the proportion of the payment which should be taken in preferred stock instead of cash the more common stock would be given. Those proposing to join the combination hoped that the preferred and common stock together would be worth more than par.

C. Rogers & Bros. expected that the other plants would be taken in on essentially the same basis as their own. The inventory value of their plant was over \$600,000, exclusive of good will and trade-marks. It had been believed that the \$9,000,000 of preferred stock which was to be issued represented a fair valuation of all the plants to be consolidated. Later various individuals began to fear that the capitalization was too large for regular payment of dividends. It was understood, Mr. Rogers adds, that the promoters of the company were to receive as their compensation 8 per cent of the total capitalization of \$20,000,000, in common stock. (1068, 1073.)

D. Wall street pool of common stock.—It appears that the stock of the International Silver Company rapidly depreciated in value from January to May, 1899. The preferred stock stood at 87½ on January 6, and at 66½ on May 26. The common stock rose from 28½ on January 6 to 38½ on February 24, but fell to 11 on May 6, and has since recovered only in part.

Mr. DODD testifies that various holders of the common stock placed it in a pool, assigning it to New York bankers, with the understanding that if it should not be sold at as high as 30 before May 1 it should be returned to the owners. The witness was unwilling to state whether he himself had assigned any stock in this manner. Whatever was done was purely private action of stockholders and had nothing to do with their official relation to the International Silver Company. The witness believes that the pool was a failure from beginning to end. Stocks fell steadily in value instead of rising. He considers, however, that it would

have been just as legitimate for him, although he was president of the company, to enter such a pool, as regards the shares which he himself owned, as if any outsider had bought the shares and entered the pool. (1060, 1061.)

Mr. ROGERS states that he was told by a stockholder, and considers the information reliable, that between \$8,000,000 and \$9,000,000 out of the \$11,000,000 of common stock of the International Silver Company was placed in the pool referred to. The pool had about 800 more shares on its hands at the close of the period, May 1, than when it began. (1070, 1071.)

E. Dividends and salaries.—The International Silver Company had up to November, 1899, declared no dividends on either its preferred or common stock. Mr. ROGERS understood from a stockholder of the company that at the time it was expected to vote a dividend none was voted, but the salaries of the directors and officers were advanced. He understands that the salaries of the active directors, which had been \$5,000, were raised to \$10,000, and of the president from \$7,000 to \$12,000, and that the treasurer received \$25,000. (1075.)

Mr. DODD and Mr. WATROUS later furnished the commission, in reply to interrogatories, a statement that the company had never actually passed a dividend, because no date had been fixed at which dividends should regularly be paid. Salaries were fixed on March 27, 1899, to date from January 1, 1899. The president receives \$12,000, four directors who are managers of the largest factories, \$10,000 each, and one other director \$7,500. No director receives a salary unless he is an active manager. The treasurer receives no salary, while the assistant treasurer is paid \$8,000 per annum. (1062, 1066.)

II. OUTPUT, COMPETITION, AND PRICES.

A. Control of output and competition.—Mr. DODD estimates that the International Silver Company manufactures perhaps 55 or 60 per cent of the plated silverware of the country and about 10 per cent of the sterling silver. The combination was confessedly formed for the purpose of reducing competition, and, from the testimony above summarized, it appears that it was expected to bring in a larger proportion of the plants than were actually united. Mr. Dodd states that the saving or advantage from reducing competition was expected to be about as important as that from economy in production. Mr. ROGERS also refers to the purpose of the combination to suppress competition. (1067.)

Mr. Dodd states, however, that the International Silver Company meets very strong competition. There are probably 40 or 50 outside concerns in the United States, including, among others, Reed & Barton, very prominent manufacturers, and C. Rogers & Bros., who control one of the Rogers trade-marks. Most of the companies actually in the combination are located in Connecticut, and there is considerable advantage in removing their competition against one another. At present, however, outside competitors are underselling the International in various places, and it does not attempt to cut prices to meet them.

Mr. Dodd further states that the International Silver Company has not closed plants, although it has transferred the machinery and men from two plants to others where there was sufficient room, thus effecting a saving. The actual output of the various plants is perhaps 20 per cent greater for 1899 than for 1898, since some of the plants were not working at their full capacity. The number of employees has been increased 10 or 12 per cent. (1051, 1054, 1055, 1059, 1067.)

Mr. ROGERS states that there is danger, in his opinion, to outside competitors, as well as to the interests of the stockholders of the International Silver Company, in the possibility that the methods of competition of that company may be influenced by speculation. Prices may be cut in order to affect the value of stocks, regardless of the cost of production. The witness believes that ordinary methods of fair competition are not to be feared by his own concern. Although there are advantages in a good, well-managed combination, a carefully operated, independent business can take care of itself. (1074, 1075.)

B. Prices.—Mr. DODD states that from 1893 to 1899 the price of silverware decreased or remained stationary. The average decrease from 1894 to 1897 he estimates at from $7\frac{1}{2}$ to 10 per cent. There was an increase of 10 per cent in the price of flat ware, in February or March, 1899. On September 1 the price of hollow ware was increased 10 per cent.

The witness believes that this increase in prices is no more than commensurate with the increased cost of material and wages. The raw material of flat ware is nickel silver, which contains mostly copper, and copper has risen in price 60 or 70 per cent. Tin, which is the basis of hollow ware, has doubled in price since 1898. The cost of raw materials may be estimated as about half the value of the finished

product. The witness does not make clear, however, the proportion of the value of the silver to the other raw materials.

Mr. Dodd admits that the combination has been able to keep up prices to some degree and in certain cases, by avoiding the cutting which formerly existed between the members of the present combination. But, taking it altogether, the consumer is getting goods relatively cheaper than before. The witness adds that a fair price must be secured from the consumer if the wages of the workmen are to be kept up. Cutting of prices means cutting of wages. Mr. Dodd also believes that the quality of goods manufactured has been either maintained or improved. (1051, 1053, 1056, 1060.)

Mr. ROGERS states that shortly after the formation of the International Silver Company it began to cut prices vigorously. The price of knives, as the witness believed at the time, was cut below cost. Soon after, perhaps in February, prices were advanced, orders having been secured from as many customers as possible at the lower prices. C. Rogers & Bros. have found the efforts of the International Silver Company to take away their trade more active than those of the previous independent concerns. The combination is maintaining the price of the Rogers 1847 brand and is reducing those of other brands, including other Rogers brands. The witness believes that the quality of the goods on which the price is being cut has deteriorated. His company has made tests and found this to be the case.

Mr. Rogers further states that the price of goods manufactured by his own concern has been advanced during the past year, but that the cost of materials and of labor have also increased considerably. There is a greater demand for goods than before, and the profits of the company are higher than they were in the depressed time preceding. (1071, 1072.)

III. ECONOMIES OF COMBINATION.

Mr. DODD, president of the International Silver Company, testified concerning the economies already effected or anticipated by the combination. It is not expected to eliminate competition, although competition has doubtless been somewhat reduced, but the chief advantages are in more economical production.

The cost of administration, officers, etc., is reduced by bringing all the companies into one.

Goods can be bought somewhat more economically in large quantities, although there is practically no saving in buying silver or pig tin, which are largely employed. The salaries of the various buyers of goods are also saved. Mr. WATROUS also mentioned this economy, speaking especially of the uniform and lower prices now paid for fancy boxes, etc. Mr. ROGERS supposes large purchases can usually be made at better rates, but thinks his concern buys as cheaply as the combination.

The cost of selling goods will be largely reduced. As yet few traveling men have been dispensed with, each factory pushing its goods in this way as before; the witness knows of only two who have been laid off. But considerable saving will be effected by closing part of the stores which have been maintained in large cities for selling goods at retail. The witness expects that perhaps 10 out of 15 throughout the country may thus be closed, although so far only one has been closed.

Further saving will be made by consolidating factories, where, for example, one has more room and machinery than the output demands. Two concerns have thus been already transferred to different roofs; practically there is no reduction in the business done. Power and other expenses are thus saved. Entirely different plants are required for manufacturing hollow and flat ware. A plant costing one and one-half or two millions is desirable for the cheapest production.

The common use of trade-marks is stated by Mr. WATROUS to be one of the chief advantages of combination, but he admits that as yet no factory makes goods under the trade-mark of another. Apparently the chief economy referred to here is a suppression of competition between these trade-marks.

Mr. ROGERS, an independent manufacturer, believes that there must be considerable saving from the consolidation in various ways. The bringing together of different plants into one establishment is an economy. There would also be, in the opinion of the witness, considerable saving in advertising. Some of the trade-marks are still being advertised as extensively as ever, the Rogers 1847 brand especially being even more advertised than before; but some other brands are being less advertised. Possibly better discounts are obtained from advertising agents by giving them larger advertisements for the combination than the separate plants could give. (Dodd, 1049, 1050; Watrous, 1063; Rogers, 1070, 1073.)

IV. LABOR.

Mr. DODD states that the labor employed by the International Silver Company is not union labor. The wages are not uniform, since the labor is skilled and the amount earned by different individuals varies according to their capacity. Each man is dealt with individually. Wages are not, in the opinion of Mr. Dodd, ever raised voluntarily, but when one of the employees asks for higher wages, as he is likely to do if the prices of the products increase, the company grants it, if it finds it necessary and desirable.

The wages of the labor employed by the combination have been increased, on the average, from 5 to 7½ per cent during the past year. (1052, 1056.)

Mr. WATROUS, one of the directors and managers of the International Silver Company, confirms the testimony of Mr. Dodd as to the character of labor and the methods of fixing wages. He states that wages are fixed entirely by individual bargaining. The men are doing different classes of work, and are not all equally competent. When a man is able to do a greater quantity and better quality of work his wages are raised independently of any question of general prosperity; that is, there is a system of promotion. The witness admits, however, that it is the rule that the men must personally apply for an increase as their skill increases, not obtaining it as a matter of course. The company has never reduced wages.

Most of the laborers employed are native-born New Englanders, some being of German descent. The wages paid range from \$1.50 to \$4 per day.

A large proportion of female labor is employed, especially in the plating works. The witness believes that in most plating establishments more than half of the employees are women, who are engaged in burnishing, packing, etc. In the manufacture of the base for plating the proportion of women is very much less. The work which the women do is not men's work, and they are not paid in the same manner.

Both of these witnesses hold that many of the employees of the International Silver Company are comparatively well off, practically all being permanent residents. The relations between the employers and employees have always been satisfactory, and there have scarcely been any strikes or labor disputes. (Dodd, 1052, 1056; Watrous, 1064, 1066.)

Mr. ROGERS testifies that the plant of C. Rogers & Bros. at Meriden has increased wages in practically the same proportion as the plants of the International Silver Company at that place, from 5 to 7½ per cent. The plant at Danbury, which is engaged in manufacturing various specialties, has increased wages somewhat more—from 10 to 20 per cent. The work at Danbury is less skilled than at Meriden. The output of the Danbury plant, consisting of specialties, meets much less competition than that of the Meriden plant. Wages were raised voluntarily by C. Rogers & Bros. before the prices were advanced. The workmen are not organized. They are paid partly by time and partly by the piece. The concern has never had any strike.

Men entering the Danbury works are paid perhaps \$4 to \$6 per week for a few weeks, while they learn the trade, and then gradually work up to as high as \$9 to \$12 per week. The hours are 10 per day. (1071-1074.)

V. BRANDS OF ROGERS & BROS.

Mr. ROGERS, of C. Rogers & Bros., testifies that the original firm of Rogers & Bros. was established some time between 1830 and 1840 at Hartford and later moved to Waterbury. The brand became known as representing reliable goods. Afterwards Rogers & Bros. sold out to a corporation, the brand being retained. One of the brothers, in connection with another relative named Gilbert Rogers, started in business in New York. The Meriden Britannia Company soon after offered Mr. Gilbert Rogers a percentage for the use of his name. Later this company entered an arrangement with the original Rogers & Bros. corporation to use its name, and dismissed Mr. Gilbert Rogers. Thereupon, about 34 years ago, three brothers of the witness, including Mr. Gilbert Rogers, formed the concern C. Rogers & Bros. at Meriden, and stamped that name on the goods. The courts upheld the right of this company to use its own name, providing goods were kept equal in equality to the original Rogers Brothers. The witness does not understand by what right the International Silver Company continues to use the trade-mark, Rogers Brothers, 1847, since the Meriden Britannia Company's right to it was supposed to expire after 10 years. There are one or two other Rogers trade-marks also, but C. Rogers & Bros. are the only company outside the

combination using a Rogers trade-mark. About 13 or 14 years ago the witness started the Rogers Silver Plate Company at Danbury. Since the International Silver Company was formed this latter concern has been amalgamated in ownership with C. Rogers & Bros., of Meriden. (1069, 1070.)

VI. EXPORT TRADE.

Mr. ROGERS stated that his own establishment exports considerable silverware, chiefly in the form of novelties, particularly mantel ornaments and clocks. Ordinary silverware has always been somewhat less expensive in Europe than in the United States, but American products have excelled in finish and are now beginning to compete in price. The domestic markets for silverware belong almost altogether to the domestic manufacturers. (1074.)

GLUCOSE SUGAR REFINING COMPANY

A. Description of business.—1. Products of corn.—Mr. MAS testifies that glucose sugar is manufactured in connection with numerous by-products. The chief product of corn is corn flour, largely used for mixing with other flours. Next comes starch and glucose sugar, made by transforming it chemically. Dextrine is used for making mucilages and sizes. Corn oil is used as a substitute or cheapener of other food and painting oils, and by vulcanization as a substitute for rubber. Corn cake is used in the same way as flaxseed cake. (73, 74.)

2. Glucose sugar.—Glucose sugar is not a substitute, strictly speaking, for cane sugar. It is worth only 1.35 cents per pound. But there is a demand for a cheaper sweetening material for sirups, candies, etc. Glucose is objectionable because of its mineral acid reaction. It is used extensively as a substitute for yeast in making beer. (82, 83.)

Mr. HAVEMEYER testifies that glucose sugar does not compete with cane sugar, but that sirups made from glucose have practically displaced refined molasses. (114.)

3. Corn flour.—According to Mr. MAS corn flour or flourine, on account of its cheapness, is mixed with other flours. It is undoubtedly nutritive, but will not make good bread alone. When bills were before Congress to restrict mixing of flour, Mr. Mas, as chemist of the Glucose Sugar Refining Company, was asked to prepare testimonials as to its wholesomeness, to counteract prejudice. He refused to do so, as it was not his business, and as he was not satisfied that flourine was as good as wheat flour. Mixtures are made in secret usually, and are difficult to discover, but microscopic examination shows a difference in texture. The witness has found "startling results" in examining certain samples of flour sent him from Minneapolis. (73, 77, 79, 83.)

4. Corn oil.—Mr. MAS, as chemist for the American Glucose Company in 1897, invented a process for refining corn oil. He believes that crude corn oil is now being sold by the Glucose Sugar Refining Company under the name of refined. Samples have been submitted to him by large consumers in various sections of the country which are only crude oil. Large consumers can easily recognize the difference by the use of a glass, but small consumers would not. (75, 80.)

Mr. MAS states further that corn oil is now chiefly used for mixing with other oils. It is exported largely to Europe and comes back mixed with cod-liver oil and olive oil, or is sold as a substitute for them. Olive oil costs not less than \$1 per gallon: corn oil, 80 cents. It is also mixed with linseed oil. The difficulty of detecting mixtures is great. (73, 74.)

By a process of vulcanization a substitute for rubber is made which costs 6 or 7 cents per pound (rubber costing about \$1), and which can be mixed with pure rubber. It is less elastic, but almost equally acid proof. Mr. Mas does not think it is popular or successful, although considerably used. The process has been known for 50 years in Europe, but was recently patented here, the witness believes, through an agent of the Glucose Sugar Refining Company, since the specifications are almost identical with the wording of a report made by him to that company. He does not consider the process properly patentable. (74, 77, 78, 81.)

B. Glucose Sugar Refining Company.—Mr. MAS testifies that this combination was formed in July or August, 1897, and included all the plants in the country except one, controlling 90 to 95 per cent of the output. Most of the plants are old, the real estate constituting their chief value, and Mr. MAS thinks \$6,000,000 would

be a fair price for them. The capital of the company is \$40,000,000, on which it pays 5 per cent. The witness believes the corn-oil refinery of the American Glucose Company at Peoria, which he planned, did not cost over \$25,000, but that it was taken by the trust at \$500,000. (78, 81, 86.)

The witness also believes the American Sugar Refining Company has some interest in the Glucose Sugar Refining Company. When he became chemist for the latter company its president told him that Mr. H. O. Havemeyer was his uncle, and hinted that he might have an opportunity to become chemist for the Sugar Trust. If this is so, it extends the number of commodities influenced by the Sugar Trust very greatly. (81-83.)

Mr. Havemeyer, on the other hand, testifies that the American Sugar Refining Company has no interest in the Glucose Company, though he himself owns perhaps 100 shares in it. (114.)

C. Effect on prices.—According to Mr. MAS, before the formation of the combination in 1897, the price of glucose was about 80 cents per 100 pounds. After combination it doubled and is now about \$1.35. Crude corn oil was then sold at \$2.25 per 100 pounds and is now sold, the witness believes, under the name of refined oil, at \$4. The witness admits that for a time before the trust was formed refined oil was sold by the American Glucose Company at \$3.50. The price of corn flour can not be ascertained because its use is chiefly secret. (79, 80.)

GENERAL ASPECTS OF COMBINATIONS— CAUSES, EFFECTS, REMEDIES, ETC.

LIST OF WITNESSES.

NOTE.—In addition to these witnesses who testified exclusively on general subjects, the opinions and evidence upon such subjects of witnesses testifying more particularly concerning special combinations are also summarized under this general division. No attempt, however, is made here to bring together conclusions based only on specific testimony as to individual combinations.

	Page of testimony.
Allen, Charles C., lawyer, St. Louis	1177-1211
Dill, James B., lawyer, New York City	1077-1089
Dos Passos, John E., lawyer, New York City	1130-1177
Edgerton, Charles E., Ithaca, N. Y.	1123-1125
Hansell, Frank R., secretary New Jersey Corporation Guarantee and Trust Company.	1094-1096
Huffcut, Ernest W., Cornell University Law School	1211-1219
Garvin, James S., assistant secretary New Jersey Registration and Trust Company.	1098, 1099
King, Charles N., secretary New Jersey Corporations' Agency.	1106-1111
Marwick, James, accountant Corporation Trust Company of New Jersey	1096-1098
Myers, James J., member Massachusetts State legislature	1127-1138
Nevins, Andrew P., counsel Corporation Trust Company of West Virginia	1111-1119,
Ryan, Dennis B., lawyer, Jersey City	1090-1106
Sawyer, W. L., secretary Corporation Trust Company of Delaware	1125-1127
Smith, J. Ernest, lawyer, Wilmington, Delaware	1119-1123
Wood, Howard K., assistant secretary Corporation Trust Company of New Jersey	1090-1094

I. CAUSES OF COMBINATION.

A. The universal tendency toward combination and its general causes.—Most of the testimony as to the causes of combination is to be found in connection with specific combinations investigated. The most common cause assigned is excessive competition. It is also pointed out, however, that combination of capital is a natural economic development under modern conditions. This is the position, for example, of Mr. Dos Passos, whose evidence is given below.

Mr. THURBER believes that combinations are a natural economic development from the growth of steam, electricity, and machinery. They are necessary because of excessive competition, reducing prices below the line of profit. All forms of industry are being done on a large scale. (4, 8.)

Mr. THURBER testifies that the French chargé d'affaires at Berlin calls attention to the growing centralization of industry in Germany. In Great Britain the tendency is marked. Among other combinations there, these are referred to: dyeing, bleaching in Lancashire, cotton spinning, cotton thread, news paper, engineering, metallic bedsteads, spring mattresses, cased tubes, spun mounts, rolled metal, brass wire, metal tubes, iron and brass fenders, china furniture, electrical fittings, marl for pottery ware, common building bricks, and coffin hardware. In many instances these combinations agree with trade unions to employ only union labor, while the latter agree to work for no firm which is outside of the combination or which cuts prices. Moreover, combination has been going on in distributing lines. Centralization of capital in grocery, provision, oil, drug, and tobacco distribution has gone on rapidly of late. Retail stores also have been grouped in associations for mutual protection. Department stores have been more developed than in America. (9.)

There are, according to Mr. GALL, very few trusts and combinations organized in Canada. Except in the oil business, the people suffer little from monopoly as yet. There is a strong sentiment against combinations, the Toronto Globe being especially vigorous in its opposition. The present Liberal Government has declared that if a trust should secure control of any article the duty on such article would be immediately removed. (685, 686.)

B. Undue tariff protection.—Mr. HAVEMEYER, president of the American Sugar Refining Company, considers that one of the chief causes of industrial combinations in the United States has been undue protection by means of the customs tariff, inducing, in the first place, excessive competition by the establishment of plants in the hope of securing the high margin between the cost and the foreign price plus the duty, and later combination in order to secure the advantage of this margin. The witness declares that the trusts are the mere machinery of the Government for plundering the people. Mr. Havemeyer suggests a uniform tariff of 10 per cent as being probably sufficient. He points out that in the manufacture of steel America can compete with any foreign market, but that under the tariff rails costing \$15 per ton can be sold here for \$24.

Mr. Havemeyer admitted, however, that the Standard Oil Company, the smelter combination, and some other important combinations receive no advantage from the tariff, and in various places admits that competition, quite aside from the tariff, may force consolidation.

Although Mr. Havemeyer believes that the present protection of the sugar refining industry, which he estimates at about 4 per cent, is insufficient, he states that it was originally built up under enormous protection.

The following quotations from Mr. Havemeyer's testimony will be of interest (101, 102, 116, 118, 133, 137):

"The mother of all trusts is the customs tariff bill. The existing bill and the preceding ones have been the occasion of the formation of all the large trusts, with very few exceptions, inasmuch as they provide for an *inordinate* protection to all the interests of the country, sugar refining excepted. Economic advantages incident to the consolidation of large interests in the same line of business are a great incentive to their formation, but these bear a very insignificant proportion to the advantages granted in the way of protection under the customs tariff.

"There probably is not an industry that requires a protection of more than 10 per cent ad valorem, and it is to obtain what is provided over such percentage in the tariff that leads to the formation of what are commonly spoken of as trusts."

"Q. But I asked you this question: If the refining industry of this country was built up under protection or a free-trade system?—A. Protection, enormous protection. Without the tariff I doubt if we should have dared to take the risk of forming the trust. It could have been done; but I certainly should not have risked all I had, which was then embarked in the sugar business, in a trust unless the business had been protected as *it was* by the tariff."

"Q. I put those two things together, first that the protective system has brought such domestic competition that you are compelled to form a trust to keep each others' throats from being cut?—A. That is just the case with sugar. Have I not just told you that prior to the formation of the Sugar Trust 18 companies went out of business, failed, were ruined, and that is the advantage of the tariff? But if you do not stick to real protection in itself, but give these producers 40 to 60 per cent, then they are bent on mulcting the public. The great trouble is the tariff, and there you are."

C. Railway discriminations.—Numerous witnesses attribute the growth of combinations primarily to discriminating rates or other advantages given by railways. They declare that such discriminations continue to exist despite the interstate-commerce act. As to the powers of the Interstate Commerce Commission, see below, pages 238, 239. Most of the evidence on this subject has already been summarized. In this connection witnesses refer to the effect of combinations among railways themselves. The evidence on this latter point is digested below, page 238.

Mr. LOCKWOOD, an independent oil producer, declares that were it not for unfair rates and discriminations on railways the power of trusts would never have developed. Such combinations are not themselves economical. They have no need to be when they receive such railway advantages. In Germany, where rates are alike to all, independent oil refiners can make profits. Men do not now dare to enter business in competition with great combinations for fear of some discrimination in transportation. (391, 392, 393, 399; see also Mr. WESTGATE'S opinion, 382.)

The railways, the witness continues, have throttled the laws of competition. They constitute one gigantic railway trust. They have become the political dictators of the country, practically controlling political bosses, legislators, Congressmen, and judges. They manage the great parties in many of our States, and are corrupting our public affairs. (391.)

Mr. RICE, an independent oil refiner, declares that after filing with the Interstate Commerce Commission general tariffs for public use the railways issue innumerable supplements, special tariffs, circulars, etc., which are filed indiscriminately, and which so amend the original tariffs that no one can tell whether there are inequalities and discriminations or not.

Mr. Rice also expresses the belief that railway companies now resort to the device of paying commissions to nominal agents for securing them large shipments of freight from certain combinations. They claim that such commissions are not illegal; but, as Mr. Rice believes, they sometimes range as high as 50 to 75 per cent of the tariff rate. (727, 732.)

Mr. RICE quotes from Franklin B. Gowen, president of the Philadelphia and Reading Railroad, to the effect that the railway is a public highway, which has been granted the right of eminent domain on the implied promise to perform its services equally for all citizens. There should be the same equality as exists regarding the use of public roads. (740, 741.)

Mr. MONNETT, attorney-general of Ohio, declares that railways and pipe-line companies, when they are given the right of eminent domain, are exercising governmental functions which they could not exercise without special grant. They are bound to act for the public good, and the Government should control them to that end. Their charters should be revoked for violation, either by the State or by the Federal Government, according to the method of granting them. As to interstate commerce, Congress has the right to seize goods shipped in violation of law, and this is not too severe a penalty. (310; 323, 324.)

Mr. ALLEN, a lawyer of St. Louis, believes that the power of trusts rests largely on that of railways. He cites the Standard Oil Company especially as having grown up largely through railway discriminations. He believes that there is not one large shipper in fifty who has not made a great part of his success through special railroad rates. He quotes Mr. A. B. Stickney, president of the Chicago and Great Western Railway, as declaring the danger of such discriminations. The report of the Interstate Commerce Commission for 1899 admits that, despite all its efforts, tariffs are constantly disregarded and discriminations continually occur.

In several cases railroad companies themselves have become largely interested in the production of commodities, and have been the sources of some of the largest trusts. The ownership of coal mines by railroad companies is especially dangerous. The witness quotes from the opinion of an English court, in the case of a railway company operating mines, that the rule has been established that railway companies must not carry on any other business, for the reason that, being armed with the power to raise large sums of money, they might acquire such a preponderating influence over some branch of trade as to drive ordinary private traders out and create a practical monopoly. (1190, 1191.)

II. EFFECTS OF COMBINATION.

A. Aggregation of capital, and corporations, in themselves.—The discussions of witnesses turn in part upon the question whether the mere concentration of a large amount of capital, regardless of any question of monopoly or combination of different interests, is injurious or otherwise, as well as upon the advantages of the corporate form of organization.

1. *Is mere aggregation of capital pernicious?*—Mr. DOS PASSOS, a lawyer of New York, holds that the opposition of many people to so-called combinations is essentially an opposition, not to a technical monopoly, but simply to the aggregation of capital in the hands of corporations. This is the attitude of mind disclosed by debates, party platforms, and public speeches.

The witness declares, however, that the persons holding this view do not show clearly, in the first place, how much capital is considered sufficient to be pernicious. No limit is drawn or can be drawn at one, two, ten, or one hundred millions.

Secondly, those holding these views do not show whether they consider the aggregation of capital in the hands of a corporation more pernicious than in the hands of a partnership or of an individual. Can a different rule be adopted in the one case from that in the other?

Finally, the question is not answered as to the uses of aggregated capital which are to be considered pernicious. Shall a corporation of \$100,000,000 capital be allowed in the railway or insurance business, but not in the manufacturing or real estate business?

The witness believes that the only possible injury from the aggregation of capital comes where the aggregation is accompanied by monopoly. The problem, therefore, is to discover whether monopoly exists. (1143, 1144.)

Mr. Dos Passos further argues that the stockholders of large corporations are not necessarily a few men of great wealth. The shares are distributed among thousands of persons of small means, young and old, widows and orphans, trustees, and executors. The great banking interests especially, although they promote these organizations, retain comparatively small ownership in them.

The attack on combinations proceeds in part, in Mr. Dos Passos's judgment, from opposition to individual wealth as such. The incentive to wealth is a worthy one, and develops intelligence, conservatism, and other qualities beneficial to society. It leads to tremendous exertions of energy. The possession of wealth is one of the greatest elements of stability in every country, and men of wealth have not only a right but a duty to take an active part in political life. (1164-1166.)

Mr. ALLEN, a lawyer of St. Louis, denies that the true issue regarding industrial combinations is that raised by Mr. Dos Passos in which he attempts to consider the question whether aggregation of capital in itself is injurious. Mr. Allen does not himself believe that aggregated capital is necessarily harmful, whether in the hands of individuals or corporations, nor has he heard others claim that it is so. It is only where aggregated capital seeks to create a monopoly that it becomes pernicious. Nevertheless, it is true that the corporate form of organization, the most conspicuous method of aggregating capital, does give an advantage in competition which may readily aid in the development of monopoly. The corporate form itself, unless properly regulated by statute, cloaks a danger.

As showing the enormous power of great aggregations of capital, especially where they already enjoy considerable monopolistic power, Mr. Allen refers to the reported recent acquisition by the managers of the Standard Oil Company of exceedingly extensive control over the gas and electric plants of New York City. It appears that the Standard Oil interests have for some time been large shareholders in one of the great gas companies of that city, and that they have recently bought out the syndicate which practically controls all the electric light, heat, and power franchises. By this purchase it was believed that all the gas companies also could ultimately be brought under the control of the combination by reason of its superior strength and facilities in competition.

Mr. Allen points out further that many great aggregations of capital are engaged in essentially quasi-public enterprises, to use the phrase employed by the courts, "affected with a public interest." These enterprises are so important to the public that unregulated control by private corporations is especially dangerous, and public supervision is essentially justified. Hitherto the decisions of the courts regarding monopolies have largely been confined to these quasi-public corporations. The extent to which the notion "affected with a public interest" can be carried is as yet uncertain. In the well-known case of *Munn v. Illinois*, it was held that the fact that 14 elevators in Chicago had practically agreed to fix rates established a "virtual monopoly," and that the owners, having devoted their property to a use in which the public has an interest, had, in effect, granted "to the public an interest in that use, and must submit to be controlled by the public for the common good, to the extent of the interest" they had thus created. In a later North Dakota case it was held that an elevator which was chiefly used for storing grain purchased outright by its owner, but which was also occasionally used for storing grain belonging to other parties, was subject to a certain statute as being employed for a public purpose. Mr. Allen doubts whether the manufacture of an article of general necessity, such as sugar, can be considered as a quasi-public business, even if a single corporation controls very nearly the entire output and is able largely to dictate prices. (1179, 1185, 1188-1191-1200.)

2. *Advantages of corporate organization.*—Mr. Dos Passos insists that the development of great corporations has been the natural result of the development of industry and commerce; that such corporations have been necessary instruments for accomplishing the constantly growing tasks of industrial life, without which we should not have reached the present stage of advancement.

In this connection the witness traces the gradual development of combinations of energy and capital through the partnership and the limited partnership up to the corporation. The disadvantages of the general partnership, which existed as far back as the times of the ancient Greeks, are the liability of each partner for all the debts, the dissolution of the partnership by the death of any partner, and the necessity of suing each of the parties rather than the partnership. The limited partnership was first introduced into this country by Pennsylvania, and enabled any partner to limit the amount of his liability by giving proper notice to the public.

The large development of the corporate form of organization, according to Mr. Dos Passos, dates from about 1850, when the railroad system first began to be largely introduced. At first the tendency was to limit the amount of capital of corporations, but these limits have gradually been extended or removed.

The chief advantages of the corporate form of organization are perpetual succession regardless of the life of the individual, limited liability of the stockholders for the debts of the corporation, the ready transferability of interest in the corporation through the use of stock certificates, and the possibility of aggregating capital from many sources for a single enterprise. In connection with the last-mentioned point the witness especially emphasizes the convenience of the form of corporation mortgages and bonds. A single individual or a few individuals would not have sufficient funds to lend to a great corporation, nor

would they be willing to risk the large sums necessary upon a single venture. By the device of mortgaging the corporate property to a trustee and selling numerous bonds under the security of this mortgage the loan is obtained from many different individuals. (1146-1149.)

Mr. STETSON, a lawyer of New York, quoted, as stating his own opinion as to the advantages of corporations, from Cook on the law of corporations, to the effect that partnerships have been found clumsy, dangerous, and inefficient for conducting large businesses. There are many disadvantages. If unsuccessful, ruin is brought upon all the members, because each partner is liable absolutely for all debts. Any member may bind the firm. The partnership may be dissolved by the action of any member, or by death. The partnership is restricted in its capital, and narrow in its exclusion of new members. All these disadvantages disappear in the corporate form of organization. The business is done, not by any member of the corporation at random, but by a few chosen directors. Large capital is created by the union of funds from many sources. The organization has perpetual existence, and can not be interfered with by the death of stockholders or their withdrawal. The members are not liable for the debts, and there are many other points of advantage. (981.)

B. How far are monopoly and consequent abuses possible. Competition.—Certain witnesses deny that there are at present any genuine monopolies in this country, or that, even in the absence of legislation, such a monopoly can be maintained for any length of time. Any attempt to raise prices unduly, leads, in their opinion, to competition. This position is denied by other witnesses.

1. *Are "trusts" no longer existent?*—Mr. DOS PASSOS declares that trusts in the technical sense, as combinations of capital, no longer exist in this country, having been discarded because of the condemnation of that form of organization by the courts. The old trust was, in accordance with the customs of law, an arrangement by which the legal owner or holder of property was bound to act for the benefit of the real owner or beneficiary. The trustees of the shares of a number of corporations were bound to operate them for the benefit of the shareholders. They issued trust certificates entitling the holder to an interest in the properties of all the companies. The advantage of this form of combination, as distinguished from complete consolidation into one corporation, was its comparative secrecy, and this the witness considers legitimate. No one except the beneficiary needed to know that the trust agreement had been made. (1141, 1142.)

Mr. ALLEN, replying to the above evidence of Mr. Dos Passos, expresses the opinion that the word "trust" has come to have a definite meaning, and that it does describe a class of organizations which actually possess monopolistic power, and which ought to be repressed in various ways.

Historically speaking, the early trusts under the English law were largely intended to enable corporations, especially religious bodies, to secure perpetual control of large amounts of property. The essential object of the trust agreements which were formed in the United States, especially during the 80's, was to fix prices and limit production. Since these purposes were contrary to law, it was natural that this form of organization should be employed in order to prevent people from knowing the secrets of the trust. This last purpose, which Mr. Dos Passos considers laudable, was simply the result of the illegal character of the combination.

Mr. Allen admits that the decisions of the courts against this form of organization have rendered the technical use of the term trust no longer applicable to existing combinations of capital. But the concrete thing which is understood by the word in popular speech may be defined, according to Mr. Allen, as "a combination of financial interests, formed with the intention of creating a monopoly."

A trust must thus have an element of combination, of bringing together different individuals or bodies which had formerly competed in business, in order thus to control industry and crush out those who venture to stand against the combination. The early combinations in the form of pools having been found ineffective, and also having been held contrary to law, and the succeeding technical "trusts" having been condemned by the courts, the modern form of trust, the consolidated corporation, including numerous formerly separate establishments, has been developed.

To constitute a trust there must be a distinct intention of creating a monopoly. There are, undoubtedly, combinations of capital which have not this intention, but Mr. Allen believes that the purpose of monopolizing has been present in the formation of the larger number of recent combinations. There is no other conceivable advantage to be gained by uniting plants engaged in the same lines of industry in widely separated places. (1178-1182.)

2. *Are there any existing monopolies?*—Mr. DOS PASSOS maintains that there are at present no monopolies in the strict legal and etymological sense of the word, aside from those granted by patents for new inventions. A monopoly is defined to be an exclusive privilege of traffic. Such a pure monopoly can be obtained only by grant of government. Such grants were frequently made in England, especially during the time of Elizabeth, but they do not exist in the United States. Special grants are sometimes made by State and national legislatures, which constitute a monopoly in a certain sense. But such charters are usually limited in time, and of later years have been made revocable, while most States have general laws for incorporation. Nor are there, Mr. Dos Passos apparently thinks, any "virtual monopolies." (1144, 1145, 1150, 1151.)

Mr. ALLEN, in opposition to Mr. Dos Passos, believes that there are at present in this country various important monopolies, and declares that the courts have in various cases declared such monopolies to exist.

The witness cites the decision of Judge Barrett in the sugar case in New York, declaring that a combination which has a tendency to prevent competition and to control prices to the detriment of the public is a monopoly, even though it be not a permanent or complete monopoly. "The question in the end is, Does it inevitably tend to public injury."

Antipathy to monopoly is deeply rooted in the human heart, and it is quite immaterial whether the monopoly exists through public grant or simply as a matter of fact.

The antipathy to monopoly is shown by a long series of statutes and court decisions from the earliest times. The witness cited, especially, various decisions of the English courts, some going back several hundred years. For example, in the case of *D'Arcy v. Allein*, the court held that a grant by Queen Elizabeth of the exclusive privilege of manufacturing and importing playing cards was void as against common law and acts of Parliament, because tending to the public injury, whereas the Queen had intended it to be for the public weal.

Mr. Allen especially denies the statement of Mr. Dos Passos that monopolies by public grant do not exist in the United States. The franchises granted by National, State, and municipal governments to railways, water companies, and various other corporations are essentially monopolistic.

The witness cites numerous recent decisions of the United States courts declaring the existence of monopolies and restraining them either under the common law or under statutes. The case of *Munn v. Illinois*, above referred to, is mentioned in this connection. That case, in spite of some criticism, has been generally followed and may be considered the law of the land.

In an Ohio suit against the Standard Oil Trust the court held that the claim that that combination had improved the quality and cheapened the cost of oil to the consumer was not a valid plea. Such is not the usual result of monopoly, and it is the policy of the law to regard what usually does happen. Temporary reduction of price may have been necessary to crush competition.

In the Knight case, in 1894, Mr. Justice Fuller, while holding that the American Sugar Refining Company did not violate the Federal antitrust law of 1890, conceded that a monopoly existed, declaring that all authorities agree that it is sufficient to show that a combination really tends toward monopoly and toward depriving the public of the advantage which flows from free competition.

The St. Louis court of appeals in 1899 decided that the National Lead Company was a combination in restraint of trade as defined by the Missouri statute, and upheld the defense made by a customer who refused to pay for a bill of goods on that ground. The method of formation of the corporation itself, under the statutes of New Jersey, was such as to imply a purpose or intention of creating a monopoly and suppressing competition.

Wherever, Mr. Allen concludes, the issue has been squarely presented to any Federal or State court, and where the purpose and tendency of any combination toward a "virtual monopoly" has been proved, the principles of the common law have been applied and the combination held illegal and void as in restraint of trade. (1182-1187, 1197.)

3. *Competition as a remedy for monopoly.*—Mr. RICE, an independent oil refiner, believes that even though they receive no advantages in shipment of goods, the great capital of modern combinations, largely acquired by unjust methods, enables them to absolutely destroy other competitors by cutting prices in places where they seek to obtain a foothold. He sees no ultimate remedy but the destruction of these combinations by the forfeiture of their charters. (790.)

Mr. DOWE, president of the Commercial Travelers' National League, declares "that competitors of combinations, lacking sufficient capital, or not being able to

compete over the entire field, are likely to be driven out of business by underselling on the part of combinations, which afterwards recoup themselves by raising prices. (37, 38.)

Mr. McNULTA, receiver of the Distilling and Cattle Feeding Company, does not believe that combinations are dangerous or can long control prices and output where the capital required for competing, as in the distilling business, is not large. The only way such a combination can then control the market is by producing at a lower cost and keeping down prices, in which case it is beneficial. But where a combination is formed in lines requiring large capital, as in iron and steel, it may raise prices and control the market; competition is not a sufficient remedy and the results are very dangerous. Such combinations should be literally crushed by law. They are a menace to our form of government, and it is an inherent power of government to protect its people from oppression. (217, 237, 240.)

Mr. DOS PASSOS declares that the natural laws of trade are sufficient to prevent any such monopoly from lasting. Every effort which has been made to corner any article of commerce has failed; witness the recent attempts at corners in breadstuffs. The moment a business ceases to be conducted in a conservative manner and undertakes to raise prices unduly, outside capital is invited into the field. The new competition which the sugar trust has encountered from time to time is cited as a remarkable proof of this position. (1144, 1145, 1150, 1151.)

Mr. THURBER thinks that combination can not abrogate competition but elevates it to a higher plane. The amount of disposable capital is so great that wherever more than a reasonable profit is obtained, competing capital flows in immediately and brings profits to a minimum. The only trusts which have prospered for any length of time are those conducted on a farsighted basis of moderate profits. The witness cites as illustrations of the effect of competition the experience of sugar, coffee, strawboard, starch, and wire-nail combinations. (614, 617.)

Mr. SMITH, president of the Wholesale Grocers' Association of New York City, declares that practically there can be no monopoly with power to raise prices unless in some highly advertised special article which people demand on account of its name and brand. New capital is always ready to come into an industry if there is a prospect of profit, and combinations must accordingly keep profits and prices reasonable. They may, indeed, become able to undersell smaller producers, but this is chiefly because of their economies. The witness considers legislation unnecessary. (68-72.)

Mr. HAVEMEYER declares that the only way for a combination to prevent competition is by keeping prices below the competitive point. (103-106.)

Mr. STETSON, a corporation lawyer, believes industrial combinations, aside from railways and similar quasi public corporations, can not escape competition, either present or prospective, and that if they do not keep their profits reasonable their business will be taken away from them. (980.)

It is implied also in the testimony of various officers of corporations as to the policy of their organizations that only by economy in production and lower prices can competition be prevented. Mr. GARY, president of the Federal Steel Company, believes that competition will be a sufficient remedy for abuses in regard to all combinations, especially if a certain degree of publicity is secured by which knowledge of excessive profits may be obtained. (1001.)

C. Effects of combination generally.—Most of the evidence as to the effects of combination will be found under the different combinations specially investigated. This is particularly true as to the evidence concerning the evil effects of combinations, their tendency to enhance prices to consumers, and to injure competitors. Several general statements are made by witnesses as to the advantages of combinations, which are summarized below.

1. *Effect of combinations on producers of raw material.*—Mr. THURBER believes that combinations are injurious to producers of raw materials as such. The number of buyers being reduced, competition is lessened and prices lowered. The American Sugar Refining Company especially has secured lower rates for raw sugar. The Standard Oil Company has been more liberal, and, perhaps, paid as much for crude oil as more numerous refiners would have done. Farmers and miners, as chief producers of raw materials, are less benefited by combinations than the more strictly consuming classes are. (12, 13, 23.)

Mr. LEE, president of the independent oil producers' organizations, believes that when a company secures practically a complete monopoly of manufacturing any article it has the producer of the raw material absolutely in its power, and will leave him little margin of profit. This is illustrated by the Standard Oil Company. (279.)

2. *Effect on individual initiative.*—Mr. DOWE, president of the Commercial Travellers' National League, believes that under combination opportunities for advancement from the laboring to the middle class or from the middle class to the highest positions no longer exist. The great superiority of our country hitherto has been its equal opportunities, securing the possibility of rising by ability. The middle class is fast disappearing, and we shall be left with the extremely rich over against the extremely poor. The individuality of citizens is worth more than lowering of prices. The saving, if any, from combination is at the expense of the intellect, strength, and moral character of the great mass of the people. (84, 86.)

Mr. LOCKWOOD also believes that the tendency of combinations is to put power into the hands of a few, making the mass of the people dependent and hence subservient. (391.)

Mr. CLARKE, an independent distiller, considers the effect of combinations on individual enterprise and character their chief evil. (186, 191.)

Mr. MOORE, who has organized several combinations, testifies that so far as the previous officers and managers of establishments entering the combination prove themselves efficient, they are retained, practically in charge of the same plants as before. There are not enough good men to go around in positions of responsibility. On the other hand, there are many older men who have invested in banks and in other permanent investments, and who are glad to retire from active life. Younger men are now running these great industries. (967.)

Mr. THURBER believes that it is undoubtedly difficult or impossible for small manufacturers or dealers to compete independently against great combinations. But when thrown out of separate business, though there may be some cases of hardship, most can find opportunities for proper use of their abilities and for promotion as employees or officers of great companies. Individual capacity is no more prevented from expressing itself by industrial organization than by military organization. The ablest naturally become leaders. (7, 8, 13, 18.)

3. *Relations of combinations and labor.*—Mr. THURBER expresses the opinion that the general effect of combination on the laboring classes is beneficial. During the past decade organization of labor has proceeded more rapidly than that of capital, and wages have increased while profits have decreased. Generally speaking, trusts are likely temporarily to reduce the number of employees if not to reduce wages, but ultimately they widen the markets for products and increase employment. The oil and sugar trusts have never had trouble with their labor. (5, 23, 24.)

Mr. SMITH, president of the Wholesale Grocers' Association of New York City, believes combinations are beneficial to labor. The interests of labor and capital are identical. Workmen are the first to be benefited by the creation of great enterprises through the labor which is given them. The witness believes that laborers get two and one-half times as much food, shelter, and clothing as 30 years ago. (69.)

Mr. LEX believes that great combinations undoubtedly tend to displace labor and ultimately will doubtless tend to reduce wages, although at present the trusts find it good policy to keep their men friendly. The witness does not believe, however, that they pay higher wages than independent employers, although they doubtless pay high salaries for their superintendents and department heads. Ultimately the effect of combinations is to give the employers far greater control over labor. The man who is skilled in one business can not, if discharged, find any other employment. A combination can close one or more of its establishments for the purpose of coercing laborers, and can keep up its profits by increasing the price of its products. In this way workmen will be made more dependent and subservient. Their only help is thorough organization. The witness cites one instance with which he is familiar, of a man discharged by the manager of one plant in a combination, as to whom notice was given to other managers that he should not be employed. He was out of work for one year. Trusts have not been long enough in existence to fully demonstrate their influence on stability of employment or on the conditions of labor. (288-290.)

Mr. DOWE, president of the Commercial Travelers' National League, admits that some trusts have advanced wages, but thinks this has not been due to generosity but to policy through fear of public disapproval. When one organization controls practically all establishments throughout the country, it can close any one in order to resist demands of laborers in it, supplying the market from its other plants. Thus the American Linseed Oil Company, having 35 mills, could easily close down one or more. (83, 85.)

The effect of combinations in displacing commercial travelers is referred to by several witnesses. Mr. DOWE believes the number of commercial travelers in the country to be 350,000, although the census figures of 1890 are only 30,000.

More than 67,000 are members of organizations. There are 368,000 manufacturing and wholesale concerns, and many employ large numbers of salesmen. The witness estimates that 35,000 salesmen have been thrown out of employment by the organization of trusts and 25,000 reduced to two-thirds their previous salaries. This would represent a loss of \$60,000,000 in salaries on a basis of \$1,200 each. The witness cited instances of the baking-powder, bicycle, chair, paper-bag, rubber, tin-plate, steel and rod, sugar, coffee, leather, thread, and type-founders' combinations. Under competition salesmen are necessary to push goods, but under combination dealers must buy from the trust, and goods can be sold without salesmen, or at least by unskilled men at low salaries. Thus the baking-powder trust has replaced men at \$4,000 or \$5,000 a year by others at \$18 per week. In a few instances salesmen may have been taken into the central offices at higher salaries as a matter of policy, but usually, if taken at all, it is at a lower salary. Men thrown out, especially the older ones, find great difficulty in securing other employment, since they are specialists in particular lines. The displacement of traveling men represents also large loss to railways, amounting, on the estimate that each traveler spends \$2.50 per day for 240 days each year, to \$27,000,000; while the loss to hotels would be at least as much as to railways. Many hotels are likely to become bankrupt if more travelers are taken off. (27-36.)

Mr. ALLEN, a lawyer of St. Louis, considers trades unions as frequently coming strictly under his definition of trusts, as combinations of financial interests formed with the intention of creating a monopoly. There can be no doubt that some of these seek to control the supply of particular classes of labor, and thereby interfere with individual liberty of workmen and others. The mere attempt to increase wages or to secure other advantages for labor is not reprehensible but praiseworthy, and the trade union becomes injurious only when it seeks monopoly. Many unions have been conducted with great discretion, and have done no substantial injury to others. The witness concurs in the attitude taken by the courts in England and the United States, recognizing the necessity of combinations of labor under existing conditions, and especially in view of the centralization of capital. (1198, 1199.)

Mr. HAVEMEYER at first stated that "trade organizations and strikes" tend "to reduce all labor to a low level;" that they "take the independence out of a man," and are not an advantage to the working class. He admits, however, under questioning, that a similar effect in destroying independence may come from combinations of capital, and also that if laborers did not consolidate "these corporations would run them out of existence;" and that they have increased their earnings under combinations, though it is not clear here whether he refers to labor or capitalistic combinations. (104, 119.)

4. *Effect of combinations on prices and cost of production. General advantages and disadvantages.*—Few specific statements regarding the effect of combinations on prices are made by the witnesses, aside from the statements relating to individual combinations investigated, although statements of the latter class often imply the belief that effects similar to those met with in individual cases are likely to be found generally. A few witnesses do express general opinions to the effect that combinations raise prices, while others reply that the economy of production under combinations permits the reduction of prices. See also evidence summarized above as to the relation of combinations to competition (p. 219).

Mr. DOWE, as president of the Commercial Travelers' National League, has investigated the attitude of traveling salesmen, having received the opinions of about 8,000 in answer to circular letters or by conversation or through agents. Only two of these have defended trusts. The great body believe that they are not only detrimental to commercial travelers, but dangerous and demoralizing to the community, tending to increase prices, prevent competition, drive out middle men and smaller producers, and increase speculation. Resolutions to this effect proposed before the Travelers' Protective Association, however, were tabled through fear of offending employers. They were not discussed fully on their merits. This organization, moreover, includes only 13,000 members, and does not represent all travelers.

Mr. Dowe further testifies that he has ascertained through correspondence with travelers for numerous trusts the precise increases in prices due to combination. Among others the following are noted: Iron pipe, increase over 100 per cent; tin-ware and enameled ware, about 33 per cent; brass goods, 60 per cent; rubber overshoes, 14 per cent; tin plate, about 30 per cent; clocks, 60 per cent; pipes and brushes, 12½ per cent; combs, 7½ per cent; while other trusts are about to increase prices. The trust in news paper advanced the prices from 1½ to 2½ cents per pound, at first on the pretense of increased demand owing to the news of the Spanish war, but it has not been reduced since.

Mr. Dowe admits, however, that combination undoubtedly makes savings in the cost of the production of some particular products; for instance, through reduction in salaries of traveling men and of officials. But these savings are at the expense of general welfare. (25-40.)

Mr. ROCKEFELLER, president of the Standard Oil Company, testifies that modern industrial combinations secure "all the advantages which would be derived from the cooperation of persons and aggregation of capital." If cooperation, or, what is the same thing, combination, is necessary on a small scale, the limit depends solely upon the necessities of business. As the business grows in size more persons and more capital must be taken in, the partnership must give way to the corporation, and, owing to the division of this country into numerous States, separate corporations must be organized in different States under united control.

The chief advantages of combination are summarized by Mr. Rockefeller as follows:

- (1) Command of necessary capital.
- (2) Extension of limits of business.
- (3) Increase of number of persons interested in the business.
- (4) Economy in the business.
- (5) Improvements and economies which are derived from knowledge of many interested persons of wide experience.
- (6) Power to give the public improved products at less prices and still make a profit for the stockholders.
- (7) Permanent work and good wages for laborers.

The disadvantages or dangers to the public which may arise from combinations are stated by Mr. Rockefeller as follows: "That the power conferred by the combination may be abused; that combinations may be formed for speculation in stocks rather than for conducting business, and that for this purpose prices may be temporarily raised instead of lowered." But the possibility of abuse is no more an argument against combination than the fact that steam may explode is an argument against steam. The abuses can be minimized, the witness believes, by proper legislation. (796, 797.)

Mr. SMITH, president of the Wholesale Grocers' Association of New York City, believes that great aggregations of capital, whether railways or manufacturing corporations, can produce much more cheaply than small ones. They have in fact cheapened everything greatly, thereby increasing the wants of the people and increasing employment. (68, 71, 72.)

Mr. GARY, president of the Federal Steel Company, believes that combinations and aggregation of capital, if certain possibilities of abuse be checked, are beneficial in cheapening production, increasing employment, and extending foreign trade. (1001.)

Mr. THURBER states that he was formerly prejudiced against trusts, but after thorough study became convinced that they are a natural and necessary economic development, and beneficial to the general public. They reduce prices to consumers, excessive prices and profits defeating themselves by inviting competition. For the time being, competing manufacturers and dealers and some employees may be injured. In the long run more wealth is produced, and it is more widely distributed. (4, 6, 18.)

Mr. ARCHBOLD, vice-president of the Standard Oil Company, believes that great aggregations of capital are a natural outgrowth of modern industrial conditions, that they are beneficial to all classes, investors, consumers, and laborers, and that they are especially efficient in extending foreign markets. (562, 565.)

Mr. HAVEMEYER, president of the American Sugar Refining Company, declares that corporations are under no obligations to the States, but the reverse. Hostility to capital drives it out of State, increasing tax rates and injuring business. Trusts are "not in the business for their health," but if all were conducted on the same principles as the sugar trust, the people would profit by having all articles controlled by trusts. The trust means the survival of the fittest, controlling the best brains and management. The day of the individual has passed; if the mass of the people profit at the expense of the individual, the individual should and must go. (108-106, 134, 135.)

Mr. MOORE, who has organized several combinations, believes that they are advantageous generally. Laboring men are coming to favor them since the combination can afford to pay larger wages. The cost of production is reduced and prices thus reduced to the consumer. The witness cites as an example of this latter result the Diamond Match Company, whose output is constantly being reduced in price. (965.)

Mr. CLARKE, an independent whisky distiller, believes that the people are less

injured by the effect of combinations on prices than by speculation in stocks and by loss of individuality of former owners of plants. Combinations of capital render possible enterprises which no individual or small company could undertake. They make experiments and improvements. We are not likely to have competition entirely crushed. (186, 191.)

Mr. DOS PASSOS, a lawyer of New York, believes that large aggregations of capital in the form of great combinations are highly beneficial. If a combination, through skillful management, without the violation of moral or civil law, is able to become successful in business, no envy or prejudice should be allowed to destroy it. The destruction of corporations means the destruction of the present commercial system. Until the opponents of combinations and corporations show affirmatively that they have struck an indisputable blow at our liberties and institutions, it is futile and unnecessary to legislate.

Mr. Dos Passos believes that any mischiefs which may arise from combination of capital are incidental questions of detail. In face of the extraordinary commercial development of this country, and in face of the present prosperity, it is impossible to say honestly that the recent development of these industrial combinations has been an evil, nor does the witness believe that specific evidence to show this has been produced.

It is true that individuals have suffered, especially those who find themselves unable to compete with the larger production and improved methods of combinations. But the "greatest good for the greatest number" must be the test of the justice of any institution.

Mr. Dos Passos quotes the conclusions stated by the chairman of the Chicago Trust Conference to show that the evils which that gentleman believed to be proved were chiefly incidental and open to remedy. The specific proposals which were made are for the most part approved by Mr. Dos Passos. (1152, 1155, 1156-1158.)

5. *Distribution of wealth.*—Mr. THURBER considers it advantageous to have large masses of capital concentrated in able hands. Equality in distribution of wealth is impossible, and if once established would endure but a moment. But in fact the tendency of trusts is to distribute wealth more widely. Previous to combination the number of partners in manufacturing firms was much smaller than the number of stockholders at present. The companies which entered the Sugar Refining Company contained only 27 members; now there are thousands of sugar stockholders. (7, 18, 24.)

Mr. Dos Passos also maintains that the organization of large corporations tends to distribute the ownership of enterprises among numerous stockholders. (1143, 1164.)

6. *Influence of combinations on legislatures, courts, etc.*—Mr. EMERY, an independent oil refiner, believes that the great combinations have practical control of State legislatures in many cases, and that public officers and courts are more or less under their influence. Were it possible to enforce existing antitrust and antidiscrimination acts effectively, further efforts against combinations would scarcely be necessary, but such enforcement can not be secured. The independent refiners have applied to the Attorney-General of the United States at different times for prosecution of the Standard Oil Company, but their letters have been pigeonholed. They have had the same experience in applying to the governor of Pennsylvania to prosecute the monopoly. Even when the corporations are sued before the courts, their officers refuse to give testimony on the ground that they will be incriminated, and in various ways they indefinitely prolong litigation. (670, 671.)

Mr. LOCKWOOD, independent oil producer, also thinks that great corporations have become the political dictators of the country. They control bosses, parties, and through them legislatures and officers. (391.)

Mr. DOS PASSOS admits that there is great danger of corruption of judicial and legislative authorities by great combinations of capital. But he believes that no other remedy than existing statutes against direct bribery and corruption is feasible. It should be remembered also that corruption is often provoked by demagogical attacks on corporations. It is generally believed that no corporation can get even proper and necessary privileges from a legislature without lobbying. (1150.)

Mr. GARY testifies that the Federal Steel Company has not sought in any way to influence politics or elections, that it has declined to contribute campaign funds, and that no influence is exercised on the vote of the employees. All of these practices Mr. Gary thinks should be discountenanced. (996, 997.)

7. *Effect in fostering speculation.*—Mr. THURBER believes that the tendency of combinations is undoubtedly to bring a large proportion of industries under speculative influence. Speculation is inevitable. Speculators will have to educate

themselves as to a variety of industries, and meantime industrial stocks are likely to have a checkered career and to suffer many crashes, but bankers and brokers are acting cautiously in loans and marginal accounts on these new stocks. (7, 19, 20.)

Mr. DOWE, president of the Commercial Travelers' National League, declares that the promoters of trusts usually come from Wall street. The speculative mania leads to the floating of trust stocks, often largely watered, at inflated prices. Sudden increases in prices of commodities are partly intended to manipulate stock markets. Speculation is likely to cause the downfall of many trusts. (26-28, 38.)

D. Rebate system.—The impression prevails among some persons, as was shown by the evidence, that a common device of combinations for maintaining prices and controlling industry is to sell goods to wholesale dealers, granting them, after a certain period, a rebate, provided such wholesalers have not sold the goods at less than fixed prices. Sometimes, it is thought, a further requirement is made that the wholesaler must handle exclusively the goods of the combination, as was shown to be the case in the rebate system adopted by the whisky combination.

Mr. SMITH, president of the Wholesale Grocers' Association of New York City, testified on the other hand that the rebate system is usually intended to protect wholesale dealers from excessive competition among themselves, and not to enable the manufacturer to maintain high prices or exclude competition. The witness considers the system just, since otherwise wholesale dealers, under modern conditions, are forced to handle a large proportion of their business entirely without profit on account of excessive competition. This difficulty arises chiefly in regard to goods of standard quality, where the wholesalers do not seek to push special brands.

The rebate or factor system was, Mr. Smith believes, originated by Proctor & Gamble in the sale of soaps more than 20 years ago. That company has maintained it effectively, thus preventing the cutting of prices by wholesalers. The baking powder companies have adopted the system, and it is likewise employed by the manufacturers of Babbitt's soap, although in the latter case the provision that soap shall not be sold at less than fixed prices has not been effectively enforced.

Mr. Smith further states that it was the excessive competition among wholesale grocers in handling certain standard goods, resulting in absence of profit or absolute loss, which led to the formation of the Wholesale Grocers' Association of New York City. This association was established 11 years ago.

In 1898 the Wholesale Grocers' Association, on motion of its president, adopted resolutions stating the impossibility of securing profits on goods of uniform quality, contending that manufacturers would distribute products most economically through jobbers, and appointing a committee to propose a system of rebates, otherwise known as a factor system, and to attempt to secure its adoption by all manufacturers of such goods. This committee found wholesale grocers unanimous in support of the plan, while many large manufacturers said such a system had been used satisfactorily by them. The committee recommended three different forms of arrangement, all of which met approval from numerous jobbers and manufacturers. In circulars issued in October, 1898, the Wholesale Grocers' Association urged that no one of these arrangements is illegal, but that the third especially, involving no contract and being purely voluntary, is impregnable to legislative attacks. The system is declared to be just and reasonable, and wholesale grocers are urged to influence manufacturers to adopt it. (55-65.)

III. STATE LEGISLATION AS A REMEDY FOR GENERAL EVILS.

A. Justification of State interference.—1. *Legislation and natural liberty.*—Mr. DOS PASSOS, an attorney at law, believes legislation on complex and difficult questions, such as those of economics, should be framed only after careful study by trained commissioners, and not, as so often happens, by hasty and thoughtless action of legislators under the influence of unthinking public opinion. He believes that it would be an advantage to the country if the great mass of State laws enacted during the past half century could be abolished and replaced by condensed statutes, carefully framed. There has been a constant cry for more legislation on the part of the people and of political parties.

Mr. Dos Passos thinks that the State is to be considered as existing by reason of a compact with the individual citizens. The citizen grants allegiance in exchange for protection to himself and his property, and there is a clear contract on the part of the Government not to intrude upon the liberty of the individual except in the case of plain and paramount necessity. (1139-1141.)

In another connection, discussing the demand for greater publicity of the affairs of corporations, Mr. Dos Passos declares that, generally speaking, the corporation

has the same right to privacy and noninterference in its own business as the individual. Unless some obvious and serious mischief will result from failure to do so, the State has no right to regulate individual conduct. It has no right to dictate what religion one shall follow, what he shall eat, or what he shall wear, unless there is some overwhelming necessity to do so. (1162, 1163.)

2. *Power of the State over corporations.*—Mr. DOS PASSOS, while deprecating undue interference with combinations of capital and corporations, admits that they differ from individuals in being creatures of the law, having no natural rights which the law is bound to respect. Moreover, the fact that a great aggregation of wealth in the hands of a corporation gives it advantages in competition and otherwise which the individual can not possess, justifies State regulation. The State should not relax its grip on corporations. It has the absolute right to examine into their conditions, and, under the present constitutions of most States, to extinguish their charters. The State has constant visitatorial powers for the purposes of taxation and of protection to the public. (1164, 1172.)

Mr. ALLEN, a lawyer, expresses the opinion that, aside from the fact that a corporation frequently controls products or services which are so necessary that the company becomes quasi-public in character, the fact that all corporations are creatures of the State gives it the absolute right to control and regulate them. It is a mistake to speak of the rights of corporations as if they were entitled to that same liberty of action and of contract which is guaranteed by our statutes to natural persons. As a matter of fact, our corporation laws have become too loose, enabling members and officers of corporations to elude responsibility, and giving them a dangerous power over the public welfare. The right of a State to interfere is, of course, still stronger in the case of quasi-public corporations. (1189.)

3. *Natural laws superior to legislation.*—Mr. DOS PASSOS believes that natural laws of industry are sufficient to remedy any evils which may arise from combinations, and especially insists that legislation, so far as it goes against these natural laws, is either entirely inoperative or works injurious results not calculated upon by the framer. It is not within the power of the Government at this stage of the development of capital to put down or impede aggregation. Legal and judicial history show that the natural laws of commerce and industry have always defied legislation. This has been especially true regarding the legislation directed against combinations. Thus, the laws against forestalling, regrating, and engrossing, passed in England as early as Edward VI, failed of their purposes and were repealed in 1772, as having a tendency to discourage agriculture and increase prices. The so-called "bubble act" and "Sir John Barnard's act," passed in the eighteenth century to restrict speculation and fraudulent prospectuses, had absolutely no effect.

Similarly the act of Congress of 1864, by which it was made a crime for any person to sell or deal in gold, unless he was the owner thereof, failed entirely to prevent speculation in gold, but had the effect of raising its price, so that the act was repealed in 15 days. The existing antitrust acts, Federal and State, have so far mostly proved ineffective. They have attacked the form and not the substance of aggregated capital; if they had attacked the substance they would have been most injurious. The Sherman antitrust law has been in practice applied chiefly, and in the opinion of the witness injuriously, to railways, although it was not the intention of its framer that it should be so applied. (1152-1155, 1158.)

B. *Existing law and its working.*—1. *Are existing laws sufficient?*—Mr. MONNETT, attorney-general of Ohio, says that Lord Coke fully two centuries ago defined monopoly and its effects in raising the prices and depreciating the quality of products, and driving out labor and competitors, in terms which accurately describe modern conditions. During Queen Elizabeth's time and that of her successors franchises or privileges to maintain monopolies had been granted by the Crown, and the courts, without any parliamentary act, came to hold this illegal. Similar decisions have been made down to this day. The witness nevertheless favors further statute legislation. (813, 814.)

Mr. DOS PASSOS maintains that the existing antitrust and penal laws, together with the common law, afford amply sufficient remedies for all possible evils connected with combinations. They offer protection to the consumer, the investor, and the stockholder. Although decisions of the courts have frequently been made under the statutes recently enacted, Mr. Dos Passos believes that the principles of the common law alone would support every decision. There have, in fact, been a number of decisions holding industrial combinations of different sorts illegal, as being in restraint of trade. Even partial restraint of trade is thus condemned. Mr. Dos Passos believes that the recent decision in the Addyston pipe

case was essentially made under the common law. The decision turns on an agreement to share business in certain territories in a way offensive to the common law, as well as to the Sherman act. (1154, 1163, 1175, 1176.)

Mr. ALLEN, replying to this argument, admits that the principles of the common law can, if properly interpreted so as to apply to changed conditions, reach practically all the evils of monopoly. In the absence of statute the courts can effectively apply the common law. But the great changes in the methods of industry, the complexity of modern civilization, make it wise to define concretely the offenses which are to be condemned rather than to render it necessary to go back to antiquated conditions and forms of procedure. Statutes, moreover, have an educative influence on the people and on the courts. They define clearly the best public opinion in relation to concrete conditions. (1193, 1204.)

See also under National legislation, pp. 232, 233; and under How far are monopoly and consequent abuses possible, p. 219.

2. *Effect of antitrust laws.*—Mr. MOORE does not think that combinations need fear unjust interference with their business by adverse legislation. Various antitrust laws exist, but the products of the great combinations are sold in the States where these laws have been passed. The people want the products and must have them. The Government is never going to pass laws that will drive manufacturers out of business.

Mr. MONNETT, attorney-general of Ohio, states that Michigan has recently adopted an antitrust act with the provision that witnesses testifying concerning trusts shall not be held to incriminate themselves by any testimony. This will prevent the present common practice of refusing to answer questions on the ground that answers will incriminate, and the witness believes that this should be the regular custom. (315.)

3. *Antitrust law of Illinois.*—Mr. PAM, general counsel of the American Steel and Wire Company, does not consider that the present anti trust law of Illinois is an unwise or an unjust law, although the manner of enforcing it might become abusive. He does not believe that the law can possibly apply to such a corporation as the American Steel and Wire Company. It has been interpreted, as regards the Chicago Gas Trust, to apply to the control of the stocks of separate corporations, supposed by the public to be competing with one another, by a syndicate or another corporation, and would doubtless be so held again. The witness does not believe that the law would apply to a corporation which bought up outright all of its competitors, so long as the motive was simply to exercise a man's prerogative of doing that with his money which will produce the most good, without entering into any arrangement in advance to oppress the consumer.

The decision of the Illinois courts regarding the Glucose Company did not strictly come under the provisions of the antitrust act. In the case of the Distilling and Cattle Feeding Company, it was proved that agreements and contracts for the control of output and prices had been made, and the court was compelled to hold this contrary to the law. (1038, 1039.)

Mr. McNULTA, receiver of the Distilling and Cattle Feeding Company, refers to the decision of the Illinois courts that that company was a combination attempting to control trade, and therefore illegal under the Illinois antitrust law. He believes that such corporations as are now being formed in New Jersey would also be held illegal if final decision were reached. He believes they would even be illegal at common law. (216, 217.)

4. *Control over foreign corporations.*—One of the chief difficulties in the application of State laws restricting combinations has been the absence of power to exclude interstate business carried on by foreign corporations. This subject is chiefly discussed below by Mr. Allen and Mr. Huffcut. (223, 232-236.)

Mr. PAM states that the right to do business, so far as it is lawfully conducted, is granted to foreign corporations under the interstate-commerce clause of the national Constitution. Nevertheless, if a foreign corporation undertook any act contrary to the law of the State, that law not being in contravention of the constitution of the State or of the United States, it could be legally restrained from such act. Thus, the American Steel and Wire Company, being incorporated in New Jersey, could not build railroads in Illinois, although, of course, individuals belonging to that company could organize a separate company to carry on the railway business. (1035, 1038.)

The laws of New Jersey provide that when the laws of any other State or nation prescribe greater taxes, penalties, fees, or other obligations and requirements upon corporations organized in New Jersey, and doing business in such other State or nation, than the laws of New Jersey impose upon foreign corporations, the State of New Jersey shall impose additional taxes and other requirements of the same amount and character on corporations organized in other States.

Mr. DILL explains that provisions of this sort, so-called retaliatory laws, have been passed in numerous States. They are intended to secure to foreign corporations the same rights as to domestic corporations. If a similar law were passed in every State, there would be an end to the discussion as to powers of a corporation organized in one State doing business in another State. The witness cited as an instance of abuse from the present state of the law that certain Italian bankers who had been refused the right to incorporate in New Jersey, organized in New York a so-called trust company, which opened a place of business in New Jersey. This has been closed as a result of the act above referred to. (1085, 1086.)

Suggestions for State legislation.—1. *General antimonopoly laws.*—Mr. ALLEN, in view of his discussion of the existing evils connected with combinations and monopolies, makes certain definite suggestions as to State and Federal legislation. As to State laws he recommends the following:

1. Each State should make a stricter classification of corporations, and enforce very rigidly the doctrine of ultra vires. This the State legislatures and courts have the power to do.

2. Each State should require corporate functions to be exercised under such official inspection as will make corporations fairly answerable to the public and prevent them from exceeding their power. Corporations being creatures of the State, it has unlimited power in this direction, and the inspection of banks and similar institutions furnishes a precedent.

3. Each State may provide that no foreign corporation shall do business within its borders without conforming to its laws. The power of the State thus to impose conditions upon foreign corporations doing business in its territory is practically undisputed. The courts have held that corporations are not natural persons, guaranteed by the Federal Constitution equal rights and privileges in the States.

Mr. Allen admits, however, that the question of the power of the State in regard to interstate commerce carried on by foreign corporations is a difficult and unsettled one, and recommends, as pointed out below, that Congress pass laws to aid in defining the rights of corporations and States. He conceives that foreign corporations should be restricted only on the ground of general restraint of trade. It would be possible, perhaps, for laws against combinations organized in other States to be evaded by the device of selling goods to individuals in such States, who should thereupon sell them to persons in the prohibiting State. Mr. Allen believes, however, that by strict interpretation of existing statutes or by additional statutes, it will be possible to prevent such evasions. In any case it will continue to be necessary to prove the intent of restraint of trade. (1187, 1193-1195, 1207, 1208.)

4. Each State can provide that the stockholders of a local corporation shall not combine, by agreement with the stockholders of any other corporation of the same or any other State, or sell or exchange shares, with the effect of restraining trade and tending to produce a virtual monopoly. The courts have always held that a combination for the purpose of boycotting is essentially conspiracy, and a combination of capitalists is just as truly a conspiracy. (1194, 1195.)

Mr. ALLEN admits that it is exceedingly difficult to prove the intent or the effect of creating a monopoly, which is essential to a court decision. Apparently, in the opinion of the witness, the mere control by an individual or a single corporation of a large percentage, or possibly even the whole, of the output of any class of products, would not in itself give evidence of the existence of an intention to restrain trade and enhance prices. The element of an agreement between different producers is apparently essential, but the form of that agreement does not matter, if the intent to restrain trade can be shown in any way. Thus the corporate form of organization would not be evidence that there was no combination, if it could be shown that the single corporation was made by the coming together of different individuals or establishments. The witness admits that the evidence as to the intent might not always be readily available, either from the articles of incorporation or by other written documents. But where plants from widely separated localities are brought together into one management, he believes that some clue to the intent, which could be made the subject of judicial proof, would almost necessarily exist. The mere general opinion and belief that a combination was formed for the purpose of restraining trade would not, apparently, in Mr. Allen's opinion, justify interference by the courts. (1182, 1187, 1197, 1201, 1205.)

Mr. MONNETT, attorney-general of Ohio, believes that it is entirely possible to attack the evil of trusts by stringent laws, provided a sufficient number of States adopt uniform and properly drawn laws. The State can control the business of a foreign corporation within its borders even more effectively than that of a domestic corporation. A provision for prosecution by persons injured is not very effect-

ive, because small dealers and consumers are not damaged in large sums and the expense of litigation is great. (330.)

2. *Prohibition of destructive competition.*—Mr. LEE, an officer of the independent oil organizations, believes that the real evil of combinations is not the mere aggregation of capital, but the use of unfair means to drive competitors out of business. Destructive competition should be made a criminal offense. The courts and juries would have to decide what constitutes destructive competition, judging the intent. If prices be kept far below the cost of production for a long period, whether in all markets or, as is more common, in local markets reached by competitors, that would be sufficient evidence. Penalties in the way of fines against the corporation, and fines and imprisonment of officers, could be effectively enforced. (294, 296.)

Mr. WESTGATE, an independent oil refiner, expresses a similar opinion to that of Mr. Lee. (383.)

Mr. LOCKWOOD, an independent oil producer, favors the enactment of a law requiring great trusts and combinations to fix a price upon their goods which, freights being considered, will be the same in every place throughout the country. This would prevent the increase of prices at noncompetitive points while they are being cut to destroy competition at other places. (394.)

3. *Regulation of charges.*—Mr. LEE thinks that quasi-public corporations, such as telegraph, electric and street railway companies should have strict regulation and their charges should be limited. This, however, is scarcely possible with ordinary business corporations. (294.)

4. *Limitation of capital.*—Mr. LEE believes that the capital of manufacturing and business corporations should be limited to \$1,000,000, which is sufficient to secure perfect division of labor, and which would prevent any company from engaging in destructive competition. If a dozen States should thus limit the amount of capital of corporations which could do business within their limits, there would be room for smaller competitors. A company with \$100,000,000 or \$500,000,000 capital can drive everyone out of business. (294, 295.)

5. *Uniform State legislation.*—Mr. ALLEN believes that it would be highly desirable that State laws regulating corporations and combinations should be uniform. Complete uniformity, however, is entirely impossible to obtain, although partial and approximate uniformity may doubtless be secured. It is certainly an anomaly and a danger that one State can create a corporation which can control the entire national market. Even where uniform laws are passed, court decisions and interpretations are likely to lack uniformity in the practical application of the statutes, or to throw out some of the statutes as unconstitutional.

Mr. STIMSON, in this connection, points out that considerable progress has been made in securing uniformity in certain kinds of laws. For example, 21 States have adopted a uniform law regarding bills and notes, and later proposals in the separate States for the modification of these laws have usually been defeated for the sake of retaining uniformity. (1209, 1210.)

6. *Special taxation.* (See also under National legislation.)—Mr. DOS PASSOS is not clear in his statements as to the amount of taxation which can properly be laid upon large corporations. He admits the desirability of improvements upon present methods, and apparently would be willing to have special methods for the taxation of corporations, although he considers that the average rate or burden of taxation upon corporations should not be proportionally higher than that upon individuals. It is just to investigate carefully the affairs of corporations for the sake of securing a fair levying of taxes, but present statutes already grant ample authority in this direction. (1172, 1173.)

Mr. LEE, an officer of the independent oil organizations, suggests that an income tax of 50 per cent on the profits of combinations would be a satisfactory remedy, except for the great difficulty of enforcing it. An inheritance tax would be largely evaded by gifts during life, and if graded would be objected to as unjust. (296.)

Mr. THURBER does not favor a proposal to take as a tax all profits of combinations above a certain dividend. They should be taxed as other individuals or corporations. Monopoly profits can not exist because of inflow of fresh capital. Combinations have given the public great benefit by their economies. The witness does not see how taxation of the income of trusts would tend to check overcapitalization. It would be unjust as a tax on good management. Taxation on stock is fairer. A tax on organization proportional to capital would check overcapitalization somewhat. (17, 21.)

7. *State control of railway rates.*—Mr. MONNETT, attorney-general of Ohio, believes that, the chief cause of the growth of trusts being discrimination in transportation charges, it is the duty of the attorneys-general of the different States to bring suit against transportation companies for violating their charters and to

secure their forfeiture. This may be made an absolute remedy. State regulation of local charges should be more strict than at present. In Ohio 400 per cent more per ton per mile is charged from Columbus to Cardington than from Columbus to Cleveland. A bill introduced in that State to require that the State rate conform to the interstate rate was defeated by the opposition of the railways. It was proposed also to introduce the long and short haul provision requiring the same tonnage rate, with a variation of only 10 per cent for different distances. Where railways are in competition with water transportation or with the Canadian Pacific, as at Chicago and Duluth, lower rates than to noncompeting points are claimed to be necessary. (324-326.)

8. *Public ownership of public utilities.*—Mr. MYERS, chairman of the judiciary committee of the Massachusetts house of representatives, expresses himself in favor of municipal ownership of natural monopolies so far as it is possible to secure honest and efficient service, avoiding political corruption. Under present conditions it will be well for most cities to hesitate before undertaking actual ownership, especially in case careful supervision is exercised over the private companies controlling these monopolies. The cities and towns in Massachusetts have been, in the opinion of the witness, very successful in their ownership and operation of water plants. They have had very little experience with public ownership of gas and electric-light plants. (1136, 1137.)

Mr. MONNETT, attorney-general of Ohio, states that the socialists believe that the trusts are showing us the possibility of public ownership on a large scale, and, therefore, should not be discouraged. He fears that Government ownership of railways and other large enterprises would be dangerous under the present conditions of the civil service, but believes that municipalities should be given the right to determine for themselves what public utilities they will own or operate. (326, 327.)

D. *Publicity through examinations, reports, etc.*—Numerous witnesses, including officers of combinations themselves, are disposed to favor a greater degree of publicity of the affairs of large corporations. This publicity is intended in part as a protection for stockholders and investors, and so far as this is the case the evidence of the witnesses is summarized under another head. (See p. 248.) Publicity is also advocated, however, as a protection to consumers, in order that the true costs of production and profits may be known.

Mr. LEE, an officer of the independent oil organizations, believes that combinations ought to be subject to Government inspection, which is undoubtedly justified under common law. But they do not appear to care much for publicity, since they are already defying public opinion. To put the combinations under the control of the Interstate Commerce Commission would be a difficult problem. (296.)

Mr. LUYTIES, an independent distiller, believes that the Government should look more carefully into the affairs of trusts, requiring them to submit to examinations and publish clear and truthful statements. (258.)

Mr. THURBER believes attempts to exterminate or largely to interfere with trusts unwise. He favors public regulation, involving public reports and inspection of accounts after the fashion of the national banking system. Such regulation may aim to prevent excessive prices, but its main purpose is protection of stockholders and investors against manipulation of stock. To prohibit interstate commerce or use of checks, drafts, etc., to corporations violating the law as to reports would be perhaps not the best penalty. Cumulative fines would be more satisfactory. (15, 16, 20.)

Mr. HAVEMEYER, president of the American Sugar Refining Company, at first stated that the Government ought not to interfere with trusts or regulate them in any way, shape, or manner. Competition is a sufficient regulator of prices; State regulation is unconstitutional. Buyers of stock should take their own risks, and the community has no right to know the earning power of corporations. The great argument against examination of books and publicity is the advantage given to competitors. The witness finally admitted that the supply of necessary articles, food-products, etc., by great corporations, takes on a quasi-public character which justifies regulation; that this might be accomplished without injury to industry, and would be especially advantageous in furnishing more accurate data for legislation. The leading answers of the witness on this point are given below. (128, 129-138.)

"A. There is always an aversion on the part of business men to expose their business to the advantage of competitors, and it is most probable that in case they did give the Government an opportunity to examine their books their condition and methods would leak out to the injury of themselves and the advantage of their competitors.

"Q. Would they be likely to be injured any more than the railroads are?—A. Yes; railroads run in certain districts. It is difficult to get a competing charter. Refineries can be built anywhere at any time.

"Q. Simply because railroads are more of a natural monopoly than refineries?—A. Yes; that is the way to put it.

"Q. Not, you think, that the people as a whole have any less interest in a sugar refinery as a consumer than they have in a railroad?—A. I think people as a whole have more interest in articles that are a matter of food than they have in matters of transportation.

"Q. So that, from the standpoint of the general public interest, if that can count for anything, there is more reason why the Government should get reports from the American Sugar Refining Company than from the railroads?—A. I think it possibly follows that where a corporation like the Sugar Company, or any other large food producer, takes on a quasi-public character, there is more reason why the public should know in reference to it."

"Q. Your own deliberate judgment is that if the inspection could be made fairly and honorably of the books of all corporations that are of this general nature, and if reports should be made regularly, it would be for the benefit of the people and presumably for that of the corporations concerned?—A. It would be the means of giving those who had the legislation in charge some more accurate data upon which to base their judgment and votes, and I really believe that until some such course is adopted industries in this country are in very great danger of very radical changes. If the Republican party, while it is in power, would gradually reduce this inordinate protection that prevails, it would be a very wise thing."

"Q. One word further with reference to the question of publicity. If I understood you correctly, you would yourself favor any bill that should be introduced that would provide for public reports of all corporations if you thought the law would be administered fairly and honestly?—A. Well, that requires more thought than I am able to give it at the moment. I can see no real harm in exposing the affairs of a corporation to governmental inspection, providing some means can be provided to protect that exposure from the advantage of the competitors. *

* * I will state broadly that where a corporation is dealing particularly in things that are essential to the benefit of mankind—clothing, fuel, oil, sugar, rice, food—anything which is peculiarly, as I have described it, of a quasi public character, it would be beneficial to the public to have them all under governmental superintendence."

Mr. ROCKEFELLER, president of the Standard Oil Company, believes in legislation "encouraging combinations of persons and capital for the purpose of carrying on industries, but permitting State supervision, not of a character to hamper industries, but sufficient to prevent frauds upon the public." (797.)

Mr. GARY, president of the Federal Steel Company, declares that it is desirable that all classes of the people should have the fullest possible knowledge of the actual facts concerning great industrial combinations. The ascertaining of such facts will be the chief benefit of the work of the Industrial Commission. Sometimes the people are inclined unduly to restrict corporations, while at other times the laws are too liberal. The great body of the people are desirous of doing the fair thing. They should be given an opportunity to hear both sides and to know the facts, avoiding misunderstandings, which are the chief cause of difficulty. The witness believes that the enforced publicity of the affairs of corporations, under State laws, is one of the best remedies for monopoly and abuses. With plenty of investigation and discussion, the corporation doing an illegitimate business will not succeed in the long run. Aside from the opposition of public opinion, competition will grow up and prove effective. Aggregation of capital, which is not the same as monopoly, is desirable, in order to produce at the lowest cost and in the largest quantity, to furnish employment to labor, and to bring to this country the largest amount of foreign money, without hurting the consumer in the meantime. (996, 1001, 1002.)

As regards the general public, considered as investors and consumers, Mr. Dos Passos denies the justice or the necessity of such extreme publicity of the affairs of corporations as is frequently demanded. No man who is not interested in a corporation has the right to know anything about it. He is entitled to protection only in his contractual relations with the corporation. The State has no more right to interfere with a corporation for the benefit of outsiders than to interfere with a private individual. It is not possible for the Government to undertake to protect all investors or to furnish them brains.

Nevertheless, Mr. Dos Passos believes that it would be just to require certain reports of corporations to be published. He distinctly favors such reports to

stockholders, and thinks that it might be desirable to make them public. Each company should have an auditor, who should make a monthly or a quarterly examination, and report the amount of business that has been done, the money on hand, the general assets and liabilities. Such detailed reports as are required from banks and other quasi-public institutions are superfluous as regards ordinary corporations. (1162, 1168, 1176, 1177.)

Mr. STETSON, a corporation lawyer of New York, expresses the opinion that aside from corporations engaged in public work, like insurance and railway companies, no requirements as to publicity, aside from the right of the stockholders to examine the books and receive published reports, should be imposed on corporations. The chief reason for this is that information thus published might be advantageously used by rivals in trade, and that it is unjust to discriminate by requiring such publicity from corporations when it can not be required from individuals and firms who compete with them. Such combinations as the American Sugar Refining Company are not to be considered as public corporations. They can not escape competition, present or prospective, and if they do not keep the prices of their products reasonable their business will be taken away from them. (975, 980.)

Mr. MOORE, who has organized various combinations, does not consider that greater publicity concerning the business of corporations is necessary than that secured by the presentation of statements of their affairs at the annual meetings. Whatever requirements be made by statutes, deception is possible. (966.)

IV. NATIONAL LEGISLATION AS A REMEDY FOR GENERAL EVILS.

A. General discussion.—Powers of Congress.—Mr. ALLEN, a lawyer of St. Louis, believes that national laws are necessary as a supplement to State legislation for the prevention of monopolies. He is inclined to favor an amendment to the United States Constitution by which corporations doing business throughout the country, and becoming thus of truly national importance, may be controlled entirely by national legislation. In the meantime, however, Congress should attempt to exercise more carefully its power under the interstate-commerce clause of the Constitution, especially defining more accurately the meaning of interstate commerce. The witness makes three definite suggestions:

(1) As aiding these several States in their endeavor to exclude foreign corporations from doing a monopolistic business within their borders, Mr. Allen suggests that Congress should enact a statute prohibiting corporations organized in one State under conditions which violate the laws of another State from engaging in interstate commerce with such prohibiting state. Mr. Allen holds that the interstate-commerce clause of the Constitution does not guarantee unrestricted commerce between the States. It simply assures the right to carry on such commerce with no other restrictions than those imposed by Congress itself. In the *Original Package* case Chief Justice Fuller held that the failure of Congress to impose restrictions under that clause must be construed to have been intentional; but later, when Congress passed an act making liquors transported into a State subject to the laws of that State, the same Justice held that Congress had the right thus to authorize States to impose restrictions. The doctrine of Chief Justice Marshall in *McCulloch v. Maryland*, as to the implied powers of Congress to adopt necessary means to carry out specified powers, would justify far-reaching action by Congress along the line suggested. This opinion has been upheld also in the *Addyston Pipe Company* case.

A definition of interstate commerce is, Mr. Allen admits, difficult to frame. The power of Congress is absolute, however, as regards all transactions which can be brought under that name. Mr. Allen suggests as a desirable method of procedure that Congress should begin by defining certain specific actions as being interstate commerce, and proceed further from time to time in making broader and more accurate definitions, as experience should suggest.

As the law is now interpreted, Mr. Allen believes that it is held that where goods are shipped, for example, from New York to Pennsylvania, the payment being made in New York, the transaction is interstate commerce, but where the goods are paid for in Pennsylvania, the title passing there, it is not so considered. The control of a State over goods, in the opinion of the witness, is held to cease as as soon as the goods are put in the possession of a common carrier for transportation to another State. (1194-1196, 1202, 1203, 1208.)

(2) Let Congress provide that no State shall be allowed to incorporate any company which is formed for the purpose of restraining interstate commerce or establishing a monopoly in any commodity to be sold to the citizens of the several States, and give to the Attorney-General power to enjoin any such corporation from doing business. (1194.)

(3) Mr. Allen quotes from Hon. Francis G. Newlands the suggestion that Congress exercise the power of taxation, a more far-reaching power than that under the interstate-commerce clause. A bureau of industry should be established, to which reports showing the condition and transactions of all corporations should be made.

In connection with this latter suggestion, Mr. Allen believes that the Government has power to require detailed reports of business as a basis for taxation, although the power of taxation has generally been construed to exist for the purpose of raising revenue primarily.

The witness also expresses the opinion that a Federal tax on corporations could be made progressive, increasing with the amount of capitalization or earnings, although the constitutionality of this is more doubtful as regards corporations already formed than as regards those hereafter to be organized, a condition of whose incorporation could be made a submission to any form of taxation. (1194, 1207, 1208.)

Mr. THURBER believes that where business is of interstate nature regulation should be by the Federal Government. There is, however, great legal difficulty in defining interstate business. Such regulations should consist primarily in requiring publicity. (16, 17.)

Mr. GARY, president of the Federal Steel Company, expresses the opinion that the only remedy needed for unlawful restraint of trade by combinations is to enforce the existing common and statute law. There is no need for Congress to pass an act as regards business carried on within the States, nor has Congress the power to do so. All that Congress could do would be to adopt a law which would be practically the present State law and common law. The witness admits, however, that the Federal courts are, on the whole, more satisfactory in their enforcement of laws than the State courts.

Congress has the right to pass a law so far as interstate commerce is concerned, but the Sherman Act is sufficient, and no one doubts the efficacy of the Federal courts in enforcing it. The witness does not believe, however, that the fact that a corporation is engaged in interstate commerce gives Federal authority any jurisdiction over that part of its business which is not interstate. It is limited to interstate business, and could examine the books of the corporation only in so far as they have to do with such business. The line between interstate and intrastate business is indeed difficult to define.

Mr. Gary doubts whether an attempt to amend the Constitution in order to give Congress jurisdiction over corporations would be successful, in view of the intrenchment upon the rights which the States consider their own. (1000, 1003.)

Mr. RICE, an independent oil refiner, declares that the present Sherman Anti-Trust Act is strong enough in its terms to protect the people from combinations if it were enforced. But he declares that the Attorney-General and the various district attorneys under his direction have not tried to enforce the law thoroughly. He states that he has had correspondence with the Attorney-General with regard to proceedings against the Standard Oil Trust, but that that officer has postponed and delayed action. Mr. Rice does not think that fines constitute an effective penalty for violations of the law, but believes that imprisonment would have a beneficial effect. (728.)

Mr. DOS PASSOS, a lawyer of New York, deprecates action by the National Government in regulating corporations and combinations beyond the strict limits of the interstate-commerce clause of the Constitution. The clause giving Congress power to regulate commerce between the several States was adopted in order to prevent the States from hampering one another and practically preventing the existence of a common country. To regulate commerce therefore does not mean to restrain commerce but to prevent it from being restrained. While the witness admits the difficulty of defining precisely the content of interstate commerce, and declares that the decisions of the courts as to its meaning are more or less inconsistent, he believes that Congress has no right under the Constitution to pass at all beyond the field of strict interstate commerce in its legislation.

Further encroachment of the Federal Government on the sphere of the States is to be deprecated by all classes and parties alike, as attacking the very foundation and theory of our institutions. It is essential to our liberties that the various local governments, such as cities, villages, etc., should have recognized rights, not to be invaded by State legislation, and likewise that the States should have proper freedom from Federal interference.

To leave out from the Sherman act the phrase "between the States," so as to make it apply to all commerce, would be unconstitutional. Mr. Dos Passos does not believe that a contract made between a man in one State and a man in

another State is to be considered interstate commerce. Nor does it affect the power of Congress as regards interstate commerce carried on by corporations that the individual States have the right to exclude corporations organized in other States. (1159-1161.)

Professor HUFFCUT, of the Cornell University Law School, submitted a discussion as to the powers of the States and Congress regarding corporations doing business within the States or between the States. (1211-1219.)

Corporations doing an interstate business as well as those doing business within individual States are practically all created by State legislation. If the corporation is not engaged in interstate commerce the State creating it has entire control over it. If it goes into other States to do business it becomes subject to the laws of those States, and they may regulate its operations to the extent of prohibiting it from doing business in their territory. If, on the other hand, it be engaged in interstate commerce, then the Constitution gives sole control over the interstate feature of its business to Congress, and denies all power to the States.

The result of this distribution of powers has been to leave the States largely helpless to remedy the evils which are believed to exist at present. Owing to the largely interstate character of modern business, any remedy for existing evils must come, at least indirectly, through Federal legislation. There are three possible solutions of the difficulty: (1) to retain the present system of dual control, and seek increased harmony of action among the States, and between the States and the National Government; (2) to give to the States, through Congressional action, larger control; (3) to exercise larger control by the National Government.

(1) In discussing the first proposition it is necessary to understand the existing powers of the States and of Congress as interpreted by the courts.

The States have very slight power as regards interstate commerce, and as regards corporations engaged in such commerce. In the matter of interstate commerce the United States are but one country. The reasons which have caused the framers of the Constitution to repose the power to regulate commerce in Congress do not affect the limit or the extent of the power. When Congress has not acted, this is to be taken as indicating its will that commerce shall be free from restrictions. State laws passed to regulate interstate commerce are invalid; although, if used in the exercise of the police power, they are held valid if local in operation and reasonable in their incidental effect upon interstate commerce. A State can not exclude a foreign corporation engaged in interstate commerce. A State can not tax a corporation, even though created under its own laws, upon interstate commerce; nor can it fix rates for carrying interstate commerce.

The United States, on the other hand, are equally circumscribed in their control of nontrading enterprises and of corporations not engaged in interstate commerce. Thus, in the Knight case, it was held that the antitrust law does not extend to a combination for the manufacture of sugar, because manufacture is not trade.

The result of these restrictions is great difficulty in reaching monopolistic corporations. The States could not exclude a trading corporation, while the United States could not attack a manufacturing corporation.

Two acts of Congress have been passed, calculated to aid the States in control of monopolistic enterprises:

(a) The interstate-commerce act has practically had little effect, the powers of the Interstate Commerce Commission not being extensive, and being largely circumscribed by judicial interpretation.

(b) The antitrust act has been the subject of several decisions by the Supreme Court. Its effect may be stated as follows: (1) A restraint of business not included under interstate commerce is not within the prohibitions of the act. (2) A combination which, although affecting interstate commerce, does not restrain it, is not within the act. (3) Any combination which does restrain interstate commerce, whether such restraint be illegal at common law or not, is illegal under the act.

The recent decision in the case of *Addyston Pipe and Steel Company v. United States* is especially referred to by Professor Huffcut as showing the broad interpretation placed by the court upon the antitrust act.

In spite of this liberal interpretation of the Federal antitrust act, it still remains difficult to adjust the balance between the powers of the States and of Congress so as to reach all the evils which arise. There are too many States which are bidding to secure the formation of corporations within their borders to make it likely that harmonious legislation by all the States can be secured, to refuse charters for corporate monopolies.

(3) The second proposed solution is that the National Government shall give to the States a larger, perhaps an exclusive control of corporations engaged in interstate commerce. The question arises whether Congress has the power to delegate such control to the States.

There is no direct authority, Professor Huffcut believes, upon this point. But various decisions cast an indirect light upon it and apparently indicate that Congress has such power. A corporation has no inherent right to go into another State than that of its origin. The only corporations that escape this rule are those engaged in interstate commerce. Congress may remove the impediment to the operation of State laws upon commerce. This has been especially decided in the cases affecting the rights of the States to prevent the sale of intoxicating liquors brought from other States. In this connection Professor Huffcut believes that Congress could also enact a law permitting the statutes of the several States to operate upon convict-made goods brought from other States. Congress may in the same way remove the impediment to the operation of State laws upon corporations engaged in interstate commerce or international commerce. A corporation is not a citizen having the right of equal privileges in the several States guaranteed by the Constitution.

(8) The third proposition is that Congress itself shall take a larger, perhaps exclusive control of corporations engaged in interstate commerce. The question arises how far Congress has the power to limit the right of corporations to engage in interstate commerce to corporations created by Congress itself. In order to force this result Congress might resort to one of three different methods.

(a) It might forbid to such corporations as fall within the definition of monopoly all use of the mails. As an exercise of the police power Congress has already excluded from the mails circulars concerning lotteries and various other publications. The police power extends, not merely to morals and safety, but to the protection of the reasonable and convenient exercise of private rights.

(b) Congress may tax State corporations upon their interstate commerce. This power has already been exercised in the case of the tax imposed on State bank issues, which is intended to suppress the evils arising from lack of uniformity as to circulating notes and to practically drive banks desiring circulation to incorporate under national law. The court in its decision as to this act recognized that the same method might be employed with regard to any other class of corporations. A national act for incorporation of companies doing interstate business, supplemented by a tax on interstate business of State corporations, would therefore be feasible.

In further support of this contention Professor Huffcut cites decisions to show that the power of Congress to regulate interstate commerce is exclusive and is restricted, if at all, only by acquiescence in the exercise of a concurrent power by the States, so far as it has merely a local effect; that Congress has the supplementary power to make all laws which are necessary and proper for carrying into execution the powers expressly granted to it, and under this provision has already created banking and numerous other corporations; that the tax upon operations of corporations engaged in interstate commerce is not a direct tax, and therefore not objectionable for want of uniformity. The privilege to engage in interstate commerce is within the control of Congress, and may therefore be taxed by the power which confers it. Some practical difficulties might arise in determining when an article sold by a corporation has become a part of interstate commerce, but this difficulty is no greater than that experienced in determining the question where the right of a State to tax interstate commerce is raised.

(c.) Congress might, if it saw fit, act directly by prohibiting State corporations from engaging in interstate commerce. Since the States are denied all power to regulate interstate commerce, the National Government has absolute power left to it. It is not possible that in the division of powers anything has been lost. If this were the case, a single State might create an artificial being which is not a citizen of any State or of the United States, and which no other State, nor the United States, could control when it passes outside of the State of its origin.

Conclusion: "Whether, finally, we are to go on under the present system of dual control, or whether we are to have a system of exclusive State control, or whether we are to have a system of exclusive Federal control, seems to be within the province of Congress to decide. The present system rests upon a long development and commends itself to the conservative and the cautious. Whether it is satisfactory or can be made so is for the economists and statesmen to determine. The system of exclusive State control would doubtless lead to different results in different States, and while it might create some confusion and inconvenience, and even hardship, it would eventually furnish a basis for a comparative study of the differing experiments. Whether this loss in uniformity would overbalance the gain from diversity I do not pretend to say. I merely point out that such diversity would furnish the data for a later movement looking toward uniformity in case such a movement should later seem desirable. The system of exclusive Federal control would seem, perhaps, the logical outcome of the constitutional provisions giving to Congress the power to regulate interstate commerce. I am even

disposed to think that it will be the ultimate solution of the present problems. Whether the time is now ripe for it, or whether we need rather to proceed first with tentative experiments under one of the other two methods, is a question upon which we may well hear more before we make haste to decide." (1211-1219.)

B. National incorporation laws.—The organization of national corporations is favored by several witnesses. Some advocate considerable regulation in connection with these laws. Others oppose all such propositions. (See also above, pp. 232-236.)

1. *Advocated.*—Mr. ARCHBOLD, vice-president of the Standard Oil Company, declares that the lack of uniformity in the laws of the various States affecting business corporations is one of the most vexatious features attending the existence of such corporations, and is likewise vexatious to the authorities of the States themselves. He considers that the next step in progress will be the establishment of Federal corporations.

"If such corporations should be made possible, under such fair restrictions and provisions as should rightfully attach to them, any branch of business could be freely entered upon by all comers, and the talk of monopoly would be forever done away with." (580.)

Mr. ROGERS, president of the National Transit Company, agrees with Mr. Archbold in favoring a Federal incorporation law, and declares that the Standard Oil Company would be willing to abandon its organization under State laws for the sake of incorporating under the United States. He does not believe that under the present Constitution such national incorporation laws could be passed, but would favor an amendment for that purpose. Such a system would be of advantage in enabling corporations to do business in the several States subject only to laws of those States as regards taxation and police regulations; it would lessen litigation regarding corporations. (585.)

Mr. ARCHBOLD further declares himself in favor of proper regulation of accounts and publicity of business under such a national corporation law as he advocates. Mr. Rogers confirms the recommendations of Mr. Archbold in this regard. Extracts from Mr. Archbold's testimony follow:

"Q. Would you consider it advantageous to the country as a whole to have greater publicity regarding the business of all the great corporations that now exist? For example, with reference to the amounts of stock that are represented by plant, the amounts represented by patents, by good will, the amounts that are water, and so on. In other words, would you consider it an advantageous thing for the country to have substantially the English corporation law apply in this country?—A. If it could be put into Federal hands, yes.

"Q. And you would favor, then, the publicity of accounts, the making of report to the Federal Government quite in detail?—A. Oh, unquestionably.

"Q. Somewhat the same system as is applied to our national banks?—A. Unquestionably."

"Q. (By Mr. KENNEDY.) Favoring national charters and national supervision, as you say, would you go to the extent of favoring inspection of the books and affairs of each concern, as the national banks are inspected by Government officials?—A. I have not made a study of the subject so as to make a statement in detail as to what the supervision and restriction should be. I should say that is a question that ought to be very carefully considered before expression is made, and I could hardly answer it to-day. On general principles, I favor all fair supervision and making of statements that would enlighten the public." (578, 580.)

Mr. ROCKEFELLER, president of the Standard Oil Company, expresses himself in favor of "federal legislation under which corporations may be created and regulated, if that be possible." (797.)

Mr. GATES, chairman of the American Steel and Wire Company, is much in favor of the granting of national charters, chiefly for the sake of legalizing the business of corporations throughout the country, and preventing undue interference by State laws. He would require a considerable payment to the National Government for charters, and a substantial annual payment thereafter, say \$1,000,000 a year for a charter of \$100,000,000. This payment would be capitalized at the beginning, but would result in preventing overcapitalization. If necessary, such a corporation should be put under the control of a national manufacturing commission, similar to the Interstate Commerce Commission. (1022.)

Mr. DILL, a corporation lawyer of New York, believes that Federal corporation laws are desirable and that they are within the powers of Congress under the clauses of the Constitution referring to the public welfare. The question of corporations has become one of national importance, and either the statutes of each State must provide that foreign corporations shall be on the same level as domestic, or Federal charters are desirable. The witness believes that the Supreme

Court, following the Marshall case, would hold that Congress had power to decide whether or not a national corporation law was a proper measure. Trusts and industrial corporations are as much a matter of public welfare as the incorporation of the Pacific railroads. The President formerly vetoed as unconstitutional appropriations for internal improvements, but river and harbor bills are now considered perfectly constitutional and normal. (1087, 1088.)

Mr. PAM, general counsel of the American Steel and Wire Company, believes that it would be advantageous to corporations doing a business more or less over the entire country if they could be incorporated by national law. It would avoid the exercise by each State of its separate right to construe the powers and duties of each corporation. There would be some question as to the taxing power in case a corporation were organized under national law, and there is some doubt as to the constitutionality of such an incorporation law, except as regards strictly interstate business. The witness is inclined to believe, however, that the general power of Congress to give charters and grants is sufficient to permit special corporation acts, except so far as the rights of individuals to control their own property are interfered with. Congress has already issued special charters to the Nicaragua Canal Company, and to railway corporations designed to operate in the Territories, but also extending beyond the borders of the Territories. (1087, 1088.)

2. *Deprecated.*—Mr. DOS PASSOS, a lawyer of New York, believes that it was a wise stretching of the Constitution to incorporate the Nicaragua Canal Company, but for Congress to incorporate other companies would, in his opinion, be unconstitutional. (1159-1161, 1174.)

Mr. STETSON, a corporation lawyer, believes that a national incorporation law would be unnecessary and therefore harmful. Under the present Constitution Congress has no power to pass such a law except as to interstate commerce; the definition which the courts will give to that term he does not know. The general welfare clause of the Constitution does not, he believes, confer an independent grant of power. (981.)

C. *Freer rights under patents.*—Mr. DOS PASSOS sees no reason for taking away the incentive to invention by withdrawing the right of exclusive manufacture of invented articles secured by the present laws, nor does he favor the suggestion that manufacture be made open to all upon the payment of a royalty to the inventor. He admits that the actual inventor of any device seldom makes much money out of it. The advantage is gained by some corporation usually. (1170, 1171.)

D. *Removal of tariff* (see also above, p. 214).—Mr. BUYNITSKY, assistant chief of the customs division of the Treasury Department, has suggested a bill authorizing the President of the United States, whenever he shall be satisfied that any article subject to customs duty is monopolized and the price controlled by a combination in such a way as to lower the wages of operatives or to secure more than a reasonable profit, to reduce by proclamation the duties on the article to the extent of not less than 5 per cent nor more than 20 per cent thereof. (50.)

Mr. GARY, president of the Federal Steel Company, states that to remove the tariff on articles largely produced by great corporations, provided protection is essential, would of course kill the corporations, but he does not believe that this is the best remedy for monopoly. There might be individuals occupied in producing the same classes of goods, and it would be impossible to withdraw the tariff as regards the corporation and not as regards the individual. The only grounds on which discriminations in the tariff could be justified would be that a corporation was doing an illegal business, and if that is once ascertained there is no need of a change in the tariff in order to suppress the corporation, since combinations in restraint of trade are illegal under common law and statute. (999, 1000.)

Mr. RICE, an independent oil refiner, believes that the tariff should be repealed so far as it applies to articles controlled by trusts and combinations. (780.)

E. *Federal regulation of railways; prevention of discriminations.*—1. *Working of present laws.*—Mr. LOCKWOOD declares that the interstate-commerce act was the result of a movement by the independent refiners of Pennsylvania, but the great railways and trusts seem to pay no attention to the law. The commission is practically powerless, and the trusts constantly threaten to still further embarrass it by testing particular powers and orders in the courts. Thus it was shown 4 or 5 years ago that the Atchison, Topeka and Santa Fe Railroad had paid out more than \$7,000,000 in rebates to favored shippers long after the act was in operation. There is practically no remedy for railway discriminations in the courts. They have been packed with men who will do the bidding of the railways, and the process in any case is too long and expensive. Thus a suit

for conspiracy brought against the Standard Oil Company and the Pennsylvania Railroad in 1879 was removed from the local court to the supreme court of Pennsylvania, which took original jurisdiction, practically stretching the constitution to do so, and the case was hung up. (388-390, 398.)

Mr. ARCHBOLD characterizes this last statement of Mr. Lockwood as outrageous, and calling for no answer. (553.)

Mr. RICE declares that the Interstate Commerce Commission has failed to enforce the law, even where it had power to do so, and where evidence of violation was amply shown. He does not consider that the complaint on the part of the commission of lack of power is altogether justified. He refers to cases which he himself has brought before the commission, where either no decisions have been reached or the decisions have been only partial. (729, 733.)

2. *Combinations among railways.*—Mr. THURBER says that combination among railways was the first prominent form of combination. By forming trunk lines rates were greatly reduced, falling from an average of 3.08 cents in 1865 to 0.72 cent in 1895. While competition of lake transportation and other causes have contributed to this reduction, it is chiefly due to mechanical improvement made possible by aggregation of capital. Rates of water transportation themselves have been greatly reduced by increased size of vessels, brought about by large capital—e. g., Rockefeller whalebacks. Pooling of railways under the supervision of the Interstate Commerce Commission is desirable. (4, 18, 19.)

Mr. RICE, an independent oil refiner, testifies that, although the United States Supreme Court has decided that the Sherman antitrust act applies to combinations of railways, such combinations still exist. Whenever there is a new decision against one of the traffic associations all the others change their names and form of organization, so as to escape liability for past offenses. Mr. Rice quoted from the Official Railway Guide for September, 1899, to show that there are at present 44 traffic associations, which he characterizes as unlawful. Many of the traffic associations include water lines, thus preventing competition from this source. The leading steamship lines on the Great Lakes are also organized into an association by themselves, and, moreover, the majority of them are owned by railroads. Mr. Rice cites the agreement between the Transcontinental Association of Railways and the Pacific Mail Company, dated October 1, 1889, by which \$800,000 per annum was paid to the steamship company for granting the railways the privilege of fixing all passenger and freight rates, both by vessel and rail, between New York and San Francisco.

Mr. Rice also points out the rapid movement toward actual consolidation of railways during the past decade, quoting from Mr. Vreeland, president of the Metropolitan Railway Company of New York, that, since 1890, 946 railroads, aggregating 68,000 miles, have been consolidated.

The witness further declares that these combinations and associations of railways work in entire harmony with the great industrial combinations. The joint capitalization of the railways and the trusts is nearly \$19,000,000,000, fully half of which is fictitious. Mr. Rice estimates that the gross receipts of the railroads are \$800,000,000 annually, and that fully \$100,000,000 annually is taken from the people by unjust discriminations, going to a privileged class of "cold and calculating men, who, by open bribery and naked rascality, secure the favor of the railroad officials." This system of favoritism has been the source of the unequal distribution of wealth in this country. It has enabled men to accumulate fortunes of \$400,000,000 to \$500,000,000, while their fellow-creatures are suffering for the bare necessities of life. (741-746.)

Mr. MONNETT states that the Central Passenger Association has been formed since the Joint Traffic Association was broken up by the decision of the United States Supreme Court. It has issued thousand-mile books, which may be used upon all the roads; they are sold for \$80, and \$10 is returned when it is shown that the tickets have not been transferred. This association is now being brought before the Ohio courts. (829.)

3. *Pooling contracts.*—Mr. STETSON, a railway and corporation lawyer, believes that railways should be allowed to make any corporate contract they choose with one another, subject to annulment by the Interstate Commerce Commission. The contract should continue in force until disapproved by the Interstate Commerce Commission, and, in case of appeal from its decision, until the reasonableness of the rates has been tested by the courts. It would be preferable that the Interstate Commerce Commission should be made a judicial body, with life tenure, and with final power to decide promptly as to railway rates. (978-980.)

Mr. DOS PASSOS, a corporation lawyer of New York, believes that by granting the railways the right to pool and operate their roads in a reasonable way the incentive to freight discriminations will be removed. (1175.)

4. *Increase of powers of the Interstate Commerce Commission.*—Mr. STETSON expresses the opinion that the power of the Interstate Commerce Commission to declare whether a rate is reasonable or unreasonable should be retained, but he sees no reason why rates fixed by railways should not remain in force until held unreasonable, and in case of appeal until the Interstate Commerce Commission has been upheld by the courts. He does not believe there are any unreasonable rates now existing. He does not consider it best to give the final decision as to matters affecting the greatest body of property in the country to a board subject to political influences and to a change in membership every 4 years. If the commission could be changed into a court and its officers given life tenure, final decision might properly be left to it, and the present injurious delays from appeals would be avoided. It is desirable that unreasonable rates, if they exist, should be immediately abolished. (978, 980.)

5. *Publicity of railways.*—Mr. STETSON, who has been employed as counsel in the reorganization of various railways, is strongly in favor of thorough publicity in their management, on account of the public nature of their services, and because of the comparative monopoly which they enjoy in particular places. (978.)

Mr. WESTGATE, an independent oil refiner, advocates the establishment of railroad examiners, who should examine the books and accounts of railroads, especially where complaint is made by persons injured, to discover whether discriminations have been made or whether charges are unjust. (382, 383.)

6. *Government ownership of railways.*—Several witnesses advocate government ownership as the only effective remedy for railway discriminations.

Mr. EMERY, an independent refiner of oil, believes that if it were possible to enforce effectively the existing laws prohibiting discriminations, making some prominent railway men examples by putting them behind prison bars, further action might be unnecessary. But such effective enforcement of law is impracticable.

The experience of Germany and of Norway and Sweden, the witness believes, shows the practicability of government ownership. In the latter case especially the motive of government ownership, which has all been worked out during the past 18 years, was to prevent railway discrimination. The independent refiners have shipped oil in Germany and Norway and Sweden and find they are able to get fair rates. (670, 671.)

Mr. LOCKWOOD, an independent oil producer, states that the independent oil refiners have found in Germany, where the railways are owned by the Government, equal conditions of shipment, and they are able to make a profit. The railways are recognized by the courts and by economists as the people's highways, which can not justly be made private property. The United States could borrow money for acquiring railways at from 1½ to 3 per cent less interest than the railways are now paying on their bonded debts. The danger of partisan abuse of the appointments to the railway service is not especially to be feared. It can be checked by proper civil-service laws, and at any rate the evils could not equal the present political corruption caused by the railways under private ownership. (392, 393.)

Mr. RICE, an independent oil refiner, believes that the influence of railways is so great, especially through their political power, that it is impossible to enforce the existing laws, and hence advocates government ownership. (730.)

7. *Control of railways in Canada.*—Mr. GALL states that there is a law in Canada against railway discriminations, and a railway committee of the privy council with certain powers of investigation. He does not think, however, that this committee has effective power to enforce its decisions. (685.)

V. CORPORATION LAWS IN THEIR GENERAL ASPECT.

Much testimony was presented as to the characteristics and effects of existing corporation laws and as to the desirability of changes in them. Most of the evidence has to do with the question of the relation between stockholders and the corporation, and as to the protection of the public as investors against frauds in capitalization. The testimony on the two latter specific topics is summarized separately.

A. *General features of corporation laws.*—1. *Liberality desirable.*—Mr. MOORE, who has organized several large corporations, expresses the belief that corporation laws should be made more liberal, and that at the same time efforts should be made to make corporate investments more secure. He thinks that the English corporation law has points of advantage, and should be copied in certain respects. The New Jersey law is somewhat along the line of the English one. In England, just

before the annual meeting, a printed copy of a statement of the condition of the company is sent to each stockholder. At the same time the directors, or at least part of them, retire and offer themselves for reelection. The former restrictions on the powers of corporations have been repealed in England, and corporations can now do anything which is legitimate. One result is that their securities can be sold on the exchange on the basis of 3 or 4 per cent interest, whereas the preferred stocks of American companies, with an interest of 7 per cent, barely sell at par. The witness thinks it should be possible for these more profitable investments to be made secure enough to enable people of smaller means to invest in them, and so obtain a larger income than can be got from Government bonds. (964, 966.)

Liability of stockholders.—Mr. STETSON, a corporation lawyer of New York, advocates the abolition of the liability of stockholders of corporations. The person doing business with a corporation should inquire into its solvency and responsibility as a corporation, just as he would inquire concerning an individual with whom he did business. The law provides adequate remedies if false information is given under such circumstances. (974.)

B. General characteristics of laws of certain States.—1. *New Jersey incorporation laws.*—Mr. MOORE, who has organized several great combinations, states that the chief advantage of incorporation in New Jersey, as compared with New York and other States, is that the taxation of corporations is on the whole more reasonable and that the laws are more liberal and just. Other States which place higher taxes upon companies and thus drive them to organize in New Jersey are working against their own interests. The witness considers that each State ought properly to protect the corporations which have their chief business located in the State. The States are getting more fully to understand the nature of corporations and are likely to make their laws more liberal.

The laws of some of the other States are already practically as liberal as those in New Jersey, but New York capitalists who invest largely in these great combinations prefer to have the corporation in New Jersey, which is near at hand. There is some question as to what would be the result upon the location of existing corporations if other States should adopt more liberal laws.

Mr. Moore does not consider that the New Jersey laws are unduly liberal. They guarantee protection to the stockholders, who are allowed to see the books, as they justly should be. The witness does not consider that greater publicity of the affairs of corporations is necessary than that obtained through the statement presented to the stockholders at the annual meeting, as is required in New Jersey. (964, 966.)

Mr. PAM, general counsel of the American Steel and Wire Company, testifies that the reason for the incorporation of that company in New Jersey was that the broad scope of its business, covering production in several different States, and including mining of iron and coal as well as manufacture of steel products, required exceedingly broad powers. The laws of New Jersey are more liberal in their scope than those of most of the other States. They give the corporation power to carry on any legitimate business in any State, and no question can be raised by any other State as to the power of the corporation, so far as its own charter is concerned. The Pennsylvania statute, for example, provides that no nonresident corporation can own more than 100 acres of land. The Illinois laws do not permit a corporation of that State to own stock in other corporations. Under the New Jersey act a corporation can own stock in a Pennsylvania corporation, which may acquire land in excess of 100 acres. This could not be accomplished by an Illinois corporation.

The Illinois law, moreover, exempts from taxation the capital stock of purely manufacturing corporations, but the courts construe the law so that if the company exercises any other power, such as the operation of mines, it is not exempt from taxation. An independent wire company in Illinois which did not engage in other branches of industry would have an advantage over the American Steel and Wire Company in the matter of taxation if the latter were incorporated in that State.

The witness considers that, under modern conditions of industry, where State lines are practically disregarded so far as economic relations are concerned, corporation laws must be liberal in order that business may be properly conducted.

Mr. Pam does not believe that the New Jersey law is unduly lax in its protection of stockholders. If anything the statute there requires greater publicity as regards stockholders than the Illinois law. (1085, 1087.)

Mr. GARY, president of the Federal Steel Company, gave similar reasons why it was incorporated in New Jersey. The witness knows of no provision in the New Jersey law especially to the disadvantage of stockholders. (996.)

Mr. BRADLEY, vice-president of the Distilling Company of America, states essentially the same grounds for the incorporation of that company in New Jersey. (823.)

Mr. STETSON, a corporation lawyer of New York, testifies that, in addition to the wide grant of powers, the advantages of incorporation in New Jersey are: (1) Taxation lower than in New York and in some other States; (2) that the liabilities of stockholders and directors are less than in certain other States, there being no personal liability of stockholders in addition to the amount of capital paid in; (3) that the law permits property to be taken in exchange for stock in accordance with a value determined by the directors in good faith, although it is not true that the stock does not have to be paid for fully in cash or property; (4) that there is no limitation on the amount of indebtedness which a corporation can incur. (971, 975.)

Mr. KING, secretary of the New Jersey Corporations Agency, enumerates essentially the same advantages of New Jersey laws as Mr. Stetson. Mr. King does not believe, however, that the New Jersey laws are the most liberal of those of any State, West Virginia especially having freer laws. He believes, on the whole, that the public are well protected under the New Jersey laws. (1108-1110.)

2. *West Virginia corporation laws.*—Mr. DILL states that a tramp corporation is understood to be one which does all its business outside of the State by which it is incorporated. The laws of West Virginia, in his opinion, permit the formation of such corporations, practically the only restriction laid upon corporations formed there being that the capital is limited to \$5,000,000. The stockholders may meet and the principal office may be located anywhere. There is nothing which must be done within the State. Since it is a recognized principle of law that the courts of one State have no power to compel the books of a corporation organized in another State to be brought to the first State for examination, the stockholders of a tramp corporation have no guarantee of access to its books whatever. (1077-1079.)

3. *Delaware corporation laws.*—The Delaware law, according to Mr. DILL, stands between those of West Virginia and New Jersey in its requirements. It does not demand that the stock and transfer books be kept in the State, but requires duplicates to be kept there, although it is not necessary that the list of stockholders be continually posted to date. (1077-1079.)

Mr. SMITH, an attorney at law, of Wilmington, Del., testifies concerning the adoption and character of the Delaware corporation laws.

Formerly the practice in this State was for the legislature to grant special charters in each case. The new constitution of 1897 authorized the legislature to establish a general corporation law. Such a law was drawn up by a joint committee of the legislature, aided by counsel, and adopted in March, 1899. Its general features were largely modeled on those of the New Jersey statute, but in certain regards the law was made more liberal, confessedly with the purpose of influencing corporations to organize in the State. The main purpose, according to Mr. Smith, was to secure the actual location of business in Delaware, a subsidiary object being to increase the State revenues by the taxes on the corporations formed there. The witness believes that several large corporations, especially some engaged in iron manufacture, have actually settled in the State, largely under the influence of this liberal statute.

The Delaware law fixes no limit to the capitalization or duration of a corporation, further than that the term of its duration must be mentioned in the articles of incorporation. A charter once granted can not be repealed or modified by the legislature, unless by a general act. (1119, 1121, 1123.)

C. *Taxation of corporations in different States.*—1. *New Jersey.*—The relatively low and fixed taxation on corporations in this State is referred to by several witnesses as a reason for incorporating there. (See p. 240.)

Mr. DILL, a lawyer of New York City, testifies that one of the chief advantages which lead corporations to organize in New Jersey in preference to other States is the certainty regarding the amount of taxation. He quotes the statement of a prominent banker of New York that it is advantageous to organize in New Jersey because that State has a surplus in its treasury and will not be driven, as is apt to occur in New York, to squeeze more money out of corporations to make up a deficiency. The taxes are fixed upon a perfectly definite basis, the amount of capital actually paid in, the rate of tax being one-tenth of 1 per cent on capital up to \$3,000,000; one-twentieth of 1 per cent in excess of \$3,000,000, but not over \$5,000,000, and \$50 for each additional \$1,000,000. In some other States there are several boards, with a number of individuals on each, who have power to fix the valuation of corporations for taxation on various bases. The witness believes that an arrangement of this kind leads to great corruption.

As to the reason for the decrease in the rate of taxation as the amount of capital increases, Mr. Dill states that when the statute levying the tax was passed corporations of the present immense capitalization were never dreamed of. The legislature has not yet had time to pass on the new question as to the just taxation of these large corporations. Mr. Dill does not consider that the present arrangement constitutes in itself a special attraction for corporations to go to New Jersey. He implies that strictly proportional taxation would be, in his opinion, more just than the present arrangement. (1081, 1086.)

2. *Delaware*.—The rate of taxation upon corporations is less in Delaware than in New Jersey, but the method is identical. The incorporation fee in Delaware is 15 cents per \$1,000 of capital, as compared with 20 cents in New Jersey. The annual franchise tax is one-twentieth of 1 per cent on the first \$3,000,000 of capital stock actually issued, as compared with one-tenth of 1 per cent in New Jersey. On the excess above \$3,000,000 the tax in Delaware is one-fortieth of 1 per cent, and on the excess above \$5,000,000 \$30 for each \$1,000,000.

Owing to the fact that the State of Delaware has comparatively light expenses, it is not likely that this franchise tax will be increased, but on the contrary it is apt to be decreased, if new corporations come to the State in large numbers. (SMITH, 1119-1123.)

3. *West Virginia*.—This State, unlike most others, requires a fixed annual license fee from all corporations, irrespective of capitalization. The first payment is required before the charter is issued. The amount of the tax is \$10 per year in case the principal place of business is in West Virginia, and \$50 in case the office is outside the State. A sworn statement must be made as to the actual location of the principal place of business, to avoid evasion of the higher fee. (NEVINS, 1113, 1117, 1118.)

4. *Ohio*.—Mr. MONNETT, attorney-general of Ohio, believes that the Ohio franchise tax law is setting the example for various other States. It values the property of the corporation according to the market value of its stock. Railways pay instead a tax of one-half of 1 per cent on gross receipts, under which \$450,000 has been collected. (327.)

VI. RIGHTS OF STOCKHOLDERS AND THEIR PROTECTION.

The belief is implied, even where it is not directly stated, by various witnesses, that corporation laws as now existing often leave stockholders largely at the mercy of the officers of the corporation, and especially that the minority stockholders are not sufficiently protected. This is denied by other witnesses. Testimony was presented especially as to the working of the laws of New Jersey, Delaware, and West Virginia in this regard.

A. *General discussion*.—1. *What should be the powers of directors and the protection of stockholders?*—The question being raised by the exceedingly great powers conferred upon the directors by the charter of the Federal Steel Company, Mr. STERSON, who drafted the charter, states that in his opinion the law should not interfere to limit the powers of the directors or to protect stockholders. There is no such thing as due or undue among competent persons of mature mind. Nothing is so destruable as liberty of compact. If the parties are willing to form a corporation with such powers, let them do so. Most of the evils which are connected with corporations have been due to paternalism, which has made investors believe that they would receive some kind of protection which they do not receive in their dealings with individuals. The investor should ascertain the character of the business into which he enters. Legislation can not make the weak and ignorant strong and competent; they can learn most by experience.

As to the obligation of directors toward stockholders, although directors are trustees, they are held only by the terms of the instrument establishing the trust. The question is simply, what are those terms.

As a matter of fact, the directors themselves usually own a large majority of the stocks of corporations, and are interested in their prosperity. The idea that there is a large body of outside stockholders who are shut out and injured by the action of the directors is a mistake. In case of financial stress, not the stockholders but the directors have to sign notes and incur the burden.

It may sometimes happen that a few stockholders or directors, although owning a majority of the stock, may have interests contrary to those of the small stockholders, who are a majority in numbers. But in the opinion of the witness directors are usually faithful to their trusts, and any gain by increased protection to the minority would be offset by decreased efficiency. (972-974.)

2. *Protection of stockholders under existing laws*.—Mr. DOS PASSOS, a lawyer of New York, believes that the common law, even aside from existing statutes,

secures the stockholder sufficient right of investigation of the affairs of corporations and sufficient protection. Through the instrumentality of a court of equity he may at any time obtain access to the books, although sometimes persons attempting to see the books for fraudulent purposes are refused that privilege. If he be reasonably persistent, an individual stockholder may obtain necessary information despite opposition from officers or large stockholders. The common law also affords ample remedies for fraud or misrepresentation.

The witness admits that frequently a minority of stockholders control the affairs of a corporation, but attributes this altogether to the indifference of the other stockholders. If, however, the majority discover abuse on the part of the minority, it is easy for them to get together and control the corporation.

Mr. Dos Passos advocates, however, full reports of corporate affairs to stockholders. Each company should have an auditor, who should make a monthly or quarterly financial statement showing the general condition and business of the corporation. (1154, 1164, 1167, 1168, 1175.)

3. *Corporation stock trusts.*—Mr. Dos Passos testifies that it has been quite a frequent occurrence lately that the holders of a majority of the shares of a corporation have placed them in the hands of trustees. These trustees have the entire voting power of the stocks, but issue certificates representing a beneficiary right to their earnings. This practice Mr. Dos Passos considers advantageous by establishing a permanent management or policy and by transferring the control from stockholders who take little interest to a few individuals who are interested and familiar with the corporation affairs. It would be possible for one company to be formed within another over and over again in a similar fashion, so that a small fraction of the original shareholders might ultimately control the entire management, but the witness does not consider any restriction of the practice necessary or desirable. (1174, 1175.)

B. *Protection of stockholders under New Jersey laws.*—1. *Summary of law.*—Mr. DILL, a corporation lawyer of New York City, testifies that the distinguishing features of the New Jersey law are:

(1) Stockholders are forbidden by law to hold meetings outside of the State, any act done at such meetings outside the State being void. Meetings must be held at the registered office of the company.

(2) The corporation is required to maintain a principal office in the State of New Jersey, the laws as to this office being perhaps more stringent than in any other State, especially since the amendments of the past 3 years.

Each corporation must state in every paper it files in the office of the secretary of state, and in every statement it publishes, the location of its office in the State and the name of the person in charge as its agent upon whom process may be served. This agent may be an individual or a domestic corporation, but by statute of 1899 no corporation hereafter organized, except a trust company, can act as such agent. A sign giving the name of the corporation must be conspicuously displayed on the outside of the principal office.

At the principal office there must be a person who is authorized to transfer stock, and he is required also, under penalty of \$200 per day, to keep a book which shall contain the name, address, and holdings of every stockholder, posted to date, and a book containing the name and address of every officer of the corporation. Ten days before the annual meeting there must be posted an alphabetical list of stockholders, with their addresses and holdings.

Each corporation must make an annual report, giving the names of its officers, agent, place of business, and other facts, to the secretary of state, and must keep it on file in the principal office.

All these records are open to inspection of all stockholders of the company at all times during business hours.

Corporations are compelled to file in the office of the secretary of state, and inferentially to keep on file in their principal office within the State, a statement under oath of every additional issue of or payment on the capital stock of the company, showing how much was paid in cash and how much in property.

Mr. Dill points out that these provisions of the statute guarantee greater publicity and assure to the stockholders more certain opportunities to ascertain the names of their fellow-stockholders and the condition of the business than the laws of most other States. In New York there is no statute requiring stock and transfer books to be open to stockholders, and although the courts have held that this is a common-law right, the stockholder desiring to enforce the right is compelled to bring suit at heavy expense. In New Jersey, if he is refused access to the books, the chancellor of the State may, without any notice to the other parties, compel the books to be brought to a designated place and kept there.

Most large corporations, according to Mr. Dill, keep sets of stock and transfer

books in New York or other cities as well as in New Jersey, but it is the books in New Jersey which are consulted by the stockholders. Every transfer made in any other office is either wired or mailed to the New Jersey office on the same day, and in the large companies with which the witness has to do the transfers are balanced in both sets of books every day at 3 o'clock. In the case of these large companies stockholders actually make frequent inquiries concerning the holdings of other individuals. There were 77 inquiries made in 3 hours just before a dividend was declared by one of the companies.

In case, however, a person buys a few shares of stock with the fraudulent intent of acquiring information concerning the corporation to its injury, he could be prevented from obtaining access to the books by an injunction. (1077-1080, 1088, 1084.)

Mr. KING, secretary of the New Jersey Corporations Agency, states that the New Jersey laws require the articles of incorporation, and later the annual reports of each corporation, to state who the agent or representative in the State is. If the agent should resign it would be the duty of the corporation to file the appointment of a new agent. The witness believes that it is possible in every case to learn the name of the resident agent at the time from the office of the secretary of state. (1111.)

2. *Evidence as to failure to comply with laws.*—Mr. DILL declares that these strict laws of New Jersey are violated by many corporations, and that there is no effective method of enforcement. The attorney-general is authorized to bring suit against corporations for failure to file their annual reports, and the law prescribes a penalty of \$200 per day, but the witness has seen a statement in the newspapers that of 10,000 corporations taken at random not 2,000 have filed these required statements. Personal investigations made by Mr. Dill on the basis of records in the office of the secretary of state incline him to believe that the statements thus made are well founded. (1079, 1080.)

Mr. EDGERTON, who has visited various companies and attorneys, registered agents of corporations in New Jersey, testifies that as regards large concerns representing numerous and important companies he believes the requirements of the New Jersey statute are generally fulfilled. The names of the corporations represented are posted, usually in the public hallway of the building, although, of course, it is impossible that so many names should be made very conspicuous.

In the case of attorneys and individuals who represent a small number of companies, from 1 or 2 up to 40 or 50, usually less important concerns, the law is seldom observed strictly.

One man stated to Mr. Edgerton that he had never had the names of the corporations represented by him posted. In at least two other instances no names were posted, but it was alleged that the signs had been temporarily removed for the purpose of having new ones painted.

These attorneys and individuals make little attempt to keep up stock and transfer books for the corporations represented. In many cases they spoke with entire frankness to the effect that this provision was entirely unnecessary and unreasonable as regards small companies having few stockholders and scarcely any transfers. One attorney stated that he advises his clients regularly that the law is sufficiently complied with if the books are brought into the State at any time when desired or requested. More often attorneys said that they advised their clients as to what the law required, and allowed them to take their own risks if they saw fit not to comply with it. All the agents maintained that inquiries from stockholders for information were very rarely or never received. The treasurer of one company representing 54 corporations declared that, so far as he knew, no such inquiries had ever been made by the stockholders.

Mr. Edgerton believes that the smaller agencies of corporations also make little attempt to require the companies represented to comply with the law in regard to filing the annual reports in the office of the secretary of state and of the agency. (1128-1125.)

Mr. RYAN, an attorney who acts as registered agent for corporations at Jersey City, testifies that stockholders and officers of corporations frequently appoint him as their agent and hold their first meetings at his office, and that he is then immediately asked to resign, or does so voluntarily, and thereafter has no further connection with the company. He has been especially in the habit of receiving corporations organized by Mr. Whitney and Mr. Noblett, New York promoters, and practically had an arrangement by which his name could be inserted in the certificate filed with the secretary of state as agent of the corporation without consultation with himself. The witness is frequently absent from his office when these stockholders' meetings are held there, and when present often does nothing whatever but stand around. He has no office help.

Mr. Ryan explains, further, that he does not mean that he always formally resigns his position as agent of the corporations thus organized, but that he simply drops their business. The corporations have offices elsewhere, often in the State, and he pays no further attention to them. It may be that his name remains upon the records as the registered agent of the company. Although it is the duty of the company to appoint another agent in case he has resigned, that is the business of the company.

The witness admits that some of the companies which are organized in this way at his office are scarcely sound organizations. They are mostly comparatively small companies—manufacturing companies—with a capital, perhaps, at the outside, of \$200,000. The witness has no knowledge, however, as to the character of their business or their officers. He does not inquire deeply into them.

No records of these companies which do business with Mr. Ryan are usually retained in his office, although there are 6 or 7 of which he is the permanent agent, with possession of certain records. In the other cases he makes a note of the name of the corporation, but keeps no list of the officers or stockholders. He simply knows the incorporators. As to the companies which retain books at Mr. Ryan's office, he believes that he has a full list of the stockholders, prepared annually by the secretary of state or by the officers of the corporations in connection with the annual meeting. Only one of the companies, however, has ever held an annual meeting. The witness is not aware that the law requires a list of stockholders to be kept up to date continually.

Mr. Ryan has several stock-certificate books in his office, and has occasionally made a few transfers of stocks, although he does not mention the names of any companies now existing as to which transfers have been recently made. The class of companies with which the witness is connected do not ordinarily transfer stock to any considerable extent. If a stockholder should ask the witness for information he would tell him all he knew, but often this would be less than the stockholder himself knew.

Mr. Ryan believes that he has been attorney, in the manner above described, for perhaps 75 different companies. As far as he knows he has complied with the New Jersey laws. He charges a fee for his services, usually only \$5 or \$10. The witness denies that any books have been sent to his office recently in order to avoid punishment for noncompliance with the law. He has kept signs on the outside of his office giving the names of the corporations represented, but recently the separate tin signs have been taken down and a new sign covering all the different companies is being painted. The witness does not consider that this neglect amounts to a violation of the law. (1099-1105.)

3. *Registration and trust companies.*—It appears that a large proportion of the more important corporations organized in New Jersey have as their authorized agents for the service of process and as the transfer agents and custodians of the stock books certain corporations specially organized for that purpose, each of which represents a large number of companies. The methods of business of these corporations were described by several witnesses, these being officers of the Corporation Trust Company of New Jersey, Jersey City; the New Jersey Corporation Guarantee and Trust Company, Camden; and the New Jersey Registration and Trust Company, East Orange. According to these witnesses it is the purpose of these companies to facilitate compliance with the New Jersey law by the corporations which they represent.

(a) *Written authority required.*—These trust companies require from each corporation registering with them a written authorization, in the form of a resolution adopted by the corporation. A uniform form is used for this purpose, of which the following is a sample:

"Ordered, (1) That, in compliance with the laws of the State of New Jersey, this corporation have and continuously maintain a principal office and place of business within the State of New Jersey, have an agent at all times in charge thereof, and upon which agent process against this corporation may be served, and in said office keep the stock and transfer books for the inspection of all who are authorized to see the same and for the transfer of stock. That the books in which the transfers of stock shall be registered and the books containing the names of the shareholders shall be at all times, during the usual hours of business, open to the examination of every stockholder at said principal office.

That the name of this corporation be at all times conspicuously displayed at the entrance of its principal office in this State.

"And be it further ordered, until this resolution be duly rescinded.

"(2) That such office and place of business be in and at the Corporation Trust Company building, 80 Grand street, Jersey City, N. J., and that this company be registered with the said trust company.

"(3) That the Corporation Trust Company of New Jersey be, and hereby is, appointed the agent of this corporation for all of the aforesaid purposes, and the agent of this company upon whom legal process against this corporation may be served within the State of New Jersey, and also the transfer agent of the stock of this company." (WOOD, 1089, 1090; HANSELL, 1095; GARVIN, 1098.)

(b) Number of companies represented.—Mr. WOOD testified that the Corporation Trust Company of New Jersey is agent of between 600 and 700 corporations, with a total capital of between \$1,000,000,000 and \$2,000,000,000. Mr. HANSELL stated that the New Jersey Corporation Guarantee and Trust Company represented about 500 companies, with at least \$500,000,000 capital. The New Jersey Registration and Trust Company, according to Mr. GARVIN, is the agent of between 275 and 300 corporations, with a total capitalization of from \$300,000,000 to \$400,000,000. Lists of the corporations thus represented by these trust companies were filed with the Commission in each case. Signs stating the names of each company represented are displayed on the outside of the buildings of these trust corporations. (1090, 1094, 1098.)

(c) Transfer of stock.—The trust companies are authorized themselves to make transfers of the stock of any of the corporations. In such a case the stock certificates are handed in, showing the transfer on the back, the entry is then made in the transfer book, posted in the stock ledger, the new certificate is countersigned, the old one canceled, and the new certificate sent to the registrar of the corporation concerned (a different individual or company), from whom it goes to the new holder. If the trust company is the custodian of the stock certificate book, the old certificate is filed with it, but the trust company is not required to keep the latter book.

As a matter of fact, the trust companies do make some such transfers, but the majority of the transfers are made at offices in New York, Chicago, and elsewhere, this being permitted by the New Jersey statute.

Some, at least, of these trust companies, such as the Corporation Trust Company of New Jersey, themselves have an office in New York, especially for making transfers in accordance with sales on the Stock Exchange. The method of business in that case is as follows: Brokers send to this New York office certificates of stock which are to be transferred, properly signed and stamped, and in exchange receive a small slip or receipt entitling them to the new certificate. The transfer is then made on the books, and a new certificate made out, recorded, and signed in the certificate book. The following morning the certificate is delivered to the registrar of the stock, usually some bank or separate authority, and the registrar delivers it to the broker. The old certificate is sent with the new certificate to the registrar for cancellation, and by him returned and filed in the New York office of the trust company or of the corporation itself.

A transfer book is kept at the New York office practically identical with that kept at the New Jersey office. A record of the transfer is made on a slip at the New York office and sent immediately to New Jersey for entry there. The record at each office is kept complete to date, the form of the book being such that the name, address, and holdings of each stockholder are shown, together with the date of the transfer of all shares to him and from him, and the persons to or from whom transferred. This book is arranged alphabetically, and is known as the stock ledger.

When stocks of any corporation represented by such a trust company are loaned or deposited as collateral, no record appears on the books of the agency, nor would the agency know anything about it. It is a private matter. If the loan is not paid, the stock would be assigned by the holder to the creditor. The stocks can not be transferred except by written authority or assignment of the stockholder. (WOOD, 1090-1098; MARWICK, 1096, 1097; HANSELL, 1095.)

(d) Accessibility to stockholders.—The stock books thus kept by registration and trust companies, so their officers state, are always available to give information to bona fide stockholders. The entire list may be shown to a stockholder in person, but requests for the entire list are not common. Usually the inquiry is as to the holdings of some individual stockholder. The information is furnished by correspondence whenever the trust company knows the signature of the stockholder or a telegram is received from his known place of business. Inquiries are more frequently from out-of-town stockholders than from Wall street. (Ibid.)

(e) Annual reports.—The trust companies, according to the statements of their officers, see that the corporations represented file their annual reports as required by law, and keep these annual reports open to the inspection of stockholders. If a company fails to file a report, the trust company goes after it personally or by letter, and if it absolutely refuses to comply with the law the trust company terminates its contract. Companies usually give no reason in case they fail to file the reports required. (1092, 1096, 1098.)

(f) *Compensation and character of work.*—Mr. WOOD testifies that the corporations contracting with these trust companies to act as their agents pay them by the month or year, in proportion to the amount of work required. Mr. MARWICK states that he could not undertake to do the work for a single large company, such as the Federal Steel Company (capital stock issued about \$100,000,000), with less than six clerks. He has been called upon to issue in one night \$9,000,000 of securities. The new certificates must be ready for use at 10 o'clock in the morning. (1094, 1097.)

4. *New Jersey Corporations Agency.*—Mr. KING, secretary and general manager of the New Jersey Corporations Agency, describes the work of that institution. While it is not formally organized as a trust company, its business, as stated by Mr. King, is carried on in essentially the same manner as that of the companies above described. The agency represents several hundred corporations with a total capital of several hundred millions. Among these are the Amalgamated Copper Company and the American Car and Foundry Company. The name of the agency is in each case on file with the secretary of state as the representative of the corporation, in accordance with law. The witness says that his agency does not in any way neglect or violate the statute. A sign giving the names of the corporations represented is regularly displayed in each case.

Stock and transfer books.—In every case the New Jersey Corporations Agency keeps transfer books of the corporations represented and sees to it that transfers are recorded. The transfers are made at the offices in other States, but lists of them are furnished to the agency. It would be possible for a stockholder to ascertain at any time who the stockholders of the company are and what their holdings are. The slips, however, are not posted in the stock ledgers daily, but in some cases weekly or monthly.

Mr. King explains the desirability of having lists of the stockholders thus open to all stockholders. Otherwise a part or a majority of the stockholders might be able to control the affairs of the company and the others might not even know who their associates were.

The statute of New Jersey also requires an alphabetical list of the stockholders to be posted in the principal office 10 days before each annual meeting. The witness states that his agency regularly insists upon obtaining such a list from the corporations which it represents and on keeping it posted.

Annual reports.—Notices are sent from the secretary of state to the agency, as the principal office of each corporation, that annual reports are due. The agency sees to it that these notices are sent to the corporations, and the reports are then sent to the agency and by it forwarded to Trenton. In case there is any delay the corporation is notified. Mr. King does not think it desirable that such an annual report should be required to contain a balance sheet or financial statement, since it would be disclosing the business of the corporation to competitors. (1106-1109.)

C. *West Virginia law.*—Mr. NEVINS, counsel for the Corporation Trust Company of West Virginia, describes the West Virginia corporation laws and the working of his company.

1. *Situs of companies.*—The State of West Virginia grants charters for corporations to do business at any place whatever. The place of the principal office must be stated in the articles of incorporation, but there is no provision requiring that the record of any change in the situs shall be made in the office of the secretary of state. It is not even necessary that the principal office, in the first place, should be the place where the actual business of the company is carried on. No meeting of the stockholders, not even the first, need be held within the State.

2. *Representation within the State.*—The statutes require that within 30 days after the articles of incorporation are filed the company must file with the secretary of state a sworn power of attorney, designating some person within the State as its legal representative or agent, whose chief function is to accept process in case of suit against the company. There is a provision that a list of the stockholders shall be kept in the office of this agent, but no penalty is attached. The witness believes that a list of the officers of the corporation is practically always kept by such agents in order that they may communicate with the corporation. There is no requirement as to reports to the secretary of state or to the stockholders.

As a matter of fact, the secretary of state acts as the representative of a great many corporations, receiving a personal fee for doing so.

If a stockholder should desire to ascertain the names of other stockholders or other information, his procedure would be to consult the certificate of incorporation to learn what the legal situs of the corporation is, and to ascertain the legal representative within the State. He would then get his information, as far as

possible, from this agent or representative, and also from correspondence with the principal office of the company. (1112-1115.)

8. *The Corporation Trust Company of West Virginia.*—This company, as stated by Mr. NEVINS, has been formed in order to facilitate the organization of corporations under the laws of West Virginia. The company has an agency in New York, and a principal office in Charleston, W. Va. Persons desiring to incorporate will come, for example, to the New York office, secure information concerning the statutes, and the charter and articles of agreement are drawn up on blank forms secured from the secretary of state of West Virginia. These are sent to the Charleston office, and filed in the office of the secretary of state. The charter, being duly signed by the secretary of state, is forwarded to New York and handed over to the corporation. It can then hold its first meeting, not necessarily in the office of the agency, but wherever it pleases. The Charleston office usually appears as the representative of the corporation in West Virginia. (1114.)

D. *Delaware law.*—1. *Summary of law.*—The Delaware law, as stated by Mr. SMITH, an attorney of Wilmington, allows meetings of stockholders, after the first, to be held wherever the charter may provide, thus differing from the New Jersey statute, which requires them to be held within the State.

Original or duplicate stock and transfer books must be kept in the principal office of the company within the State, the law differing from that of New Jersey, which requires the original books to be kept within the State. It is apparently not absolutely required to keep these books posted to date. The law prescribes that an alphabetical list of the stockholders shall be posted in the principal office and furnished to stockholders at least 10 days before their annual meeting.

The Delaware law further requires that, during January of each year, the officers of every corporation organized under the law must make a return to the secretary of state, giving the names of the officers and their residences, the location of the principal office, and the name of the agent within the State on whom process may be served; also an absolute statement of the amount of stock issued by the corporation and outstanding at the time of the report. This report is intended largely for the purposes of taxation, and in the case of companies subject to special forms of taxation, additional details are required. The first reports under this statute were not yet due at the time of Mr. Smith's testimony. (1119-1123.)

2. *Representation of Delaware corporations.*—Several corporations have been formed for the purpose of facilitating compliance with the law, in the manner already described in the case of the New Jersey registration and trust companies.

Mr. SAWYER, secretary of the Corporation Trust Company of Delaware, testifies concerning the methods of that company. He states that he understands two or three other companies have been formed of the same nature, but whereas his company represents from 150 to 175 corporations, he believes that the highest number represented by any other trust company is 15. The Delaware statute has been in force only since March and the methods of business are not as thoroughly perfected as they will be later.

The Corporation Trust Company of Delaware has an office in New York and one in Dover. At the Dover office it has a person to act as representative for the various corporations, and a corporate sign is exhibited for each.

It is the practice of this company to keep the duplicates, rather than the originals, of the stock and transfer books at the Delaware office. The attempt is made to keep the duplicates as nearly up to date as possible, although daily reports of transfers are not apparently customary. Some of the larger companies represented make quite frequent transfers.

There are a number of companies among those represented by the Corporation Trust Company which have not yet issued any stock or filed duplicate books in the office of the trust company. In fact comparatively few of the entire number have done so, but the witness believes that by January 1, 1900, practically all will have complied with the law. The company has been urging the various corporations to attend to the matter.

The first annual report required under the Delaware law is not due until January, 1900, but it is the purpose of the Corporation Trust Company to require each corporation represented to comply with the law. (1125-1127.)

VII. ABUSES AS TO CAPITALIZATION. PROTECTION OF INVESTORS.

It is held by many witnesses, as has been brought out in the testimony concerning specific combinations investigated, that many recently formed corporations are largely overcapitalized. Stocks are issued, it is claimed, for property and services in excess of their value. This constitutes a danger to the general

public, in that prices may be raised to secure dividends on inflated capital, and especially to investors, who are likely to be deceived in the purchase of stocks as to their true value. The regulation of capitalization is advocated by some witnesses and deprecated by others. See also the testimony as to publicity of corporate affairs, summarized above, p. —.

A. What constitutes overcapitalization?—Mr. DOS PASSOS, a lawyer of New York, points out that one class of persons believe that corporations should be capitalized strictly on the basis of actual cost or value of the property, while others would base the capitalization on earning power. The witness believes that under certain circumstances one basis may be just and under other circumstances the other. It is going too far to lay down an arbitrary rule that capitalization shall be based in every case on actual value, regardless of "good will," trade-marks, individual skill, and opportunity.

Mr. DOS PASSOS believes especially that the overcapitalization of railroads, against which complaint is often made, has been almost absolutely necessary in many cases in order to induce capitalists to take the risk of investment in a practically untried enterprise, the profits of which could not be accurately estimated in advance. Thus in the case of the Pacific railroads, capital had to be secured on the basis of engineers' maps and rough estimates, bonds had to be sold much below par, or common stocks had to be given as a bonus to secure capital. The development of the country has been so great that large fortunes have often been made from the increased value of these securities. (1149, 1150.)

Mr. MOORE, the promoter of various combinations, testifies that in the companies which he has formed the preferred stock practically represents the cash value of the various plants at the time of the organization. The preferred and common stock taken together have, in most cases, soon risen to a price greater than par: that is, the selling price of \$100 of preferred stock plus \$100 of common stock has been considerably above \$100. When asked as to the basis of this surplus value above the cost of the properties, the witness states that he can not tell further than that practical men believe in the success of these combinations and subscribe to their stock. The effective management of the plants will turn out to be of more value than the plants themselves. (967.)

Mr. THURBER believes that capitalization should not be based simply on actual cost of the plant. Good will is often the principal value, e. g., newspapers. Earning power is a fair measure by which to regulate capital, even though thereby the percentage of earnings to actual cost is concealed. It is difficult to judge where capitalization becomes excessive, because of variations in earning power. The preferred stock of trusts usually covers the actual cost of plants and common stock is a bonus. Restriction on capitalization in excess of present or immediately probable earning power is perhaps desirable, chiefly for the protection of investors, who may buy under favorable conditions or speculative advances and later fail to receive dividends. A tax on organization, proportional to the amount of capital, would check overcapitalization. (6, 17, 21.)

Mr. GATES, chairman of the American Steel and Wire Company, thinks that capitalization should be based on earning power rather than on cost of plants. The English have a more correct appreciation of this principle and recognize more fully the value of good will than Americans do. (1021.)

Mr. HAVEMEYER, president of the American Sugar Refining Company, expresses somewhat similar opinions to those of Mr. Gates. (111, 116.)

B. Dangers of overcapitalization and fraudulent issues of stock.—Mr. DILL, a corporation lawyer of New York City, believes that, while many corporations with very large capital are not overcapitalized, there are many others which either have a fraudulent purpose originally or may become the cause of fraudulent action. Any corporation which is grossly overcapitalized is presumably organized for the purpose of getting the stock into the hands of the public, and in order to do this there must be either misrepresentation or concealment of material facts. The witness knows of one corporation which he was asked to organize, the value of whose assets was believed, after careful examination by his office, not to exceed \$500,000. The proposed capitalization was \$8,000,000, and the company has since been organized for that sum. The prospectus of this company may not contain directly false representations, but it lacks greatly in the statement of material facts.

Aside from the possible injury to investors from overcapitalization, a fraudulently capitalized company seeks usually to make a show of earnings, and this must result either in robbing the capital or in increasing the prices of its product or reducing the wages of labor.

Mr. Dill knows of at least one large corporation recently formed in which the preferred stock consisted simply of the working capital contributed by outside

parties, and the common stock represented the actual value of the plants put in, without any element of good will. This he has always considered the safest method of capitalization. Nevertheless good will is, in the majority of instances, worth more than the bare plant. One house in New York which failed 3 years ago has disposed of all of its assets except its good will, but was offered \$1,000,000 in cash for that alone recently. (1080, 1084.)

Mr. SMITH, president of Wholesale Grocers' Association, thinks that there is likely to come a time of trade depression when overcapitalized corporations will not be able to pay dividends. Overcapitalization would not harm the original owners of stock, but would injure investors who have bought it at inflated prices. (69.)

Mr. MYERS, chairman of the committee on judiciary of the Massachusetts house of representatives, believes that, while combination often reduces the cost of production and is advantageous, one of the chief motives for the organization of combinations in recent years has been the desire to issue overcapitalized securities, and to dispose of them to the public at a profit. If two shares of stock, one of preferred and one of common, are issued for each unit of actual value, a profit is often gained by unloading this on the community, but the community suffers the consequences. Accordingly, if all States would pass statutes similar to those of Massachusetts to prevent overcapitalization, there would be much less tendency toward combination than at present.

The witness admits, however, that it is very doubtful whether all or even a large proportion of the States can be led to pass such laws. Moreover, in the case of companies doing business in different parts of the country, but securing charters from some particular State, it would be extremely difficult if not impossible for the authorities of that State to know the actual value of property taken in exchange for stock or to decide what constituted a fair capitalization. Mr. Myers implies, therefore, that Federal legislation on this subject would be desirable, but states that he does not know precisely the constitutional power of Congress regarding corporations. (1133, 1138.)

C. How far should laws regulate capitalization and stock issues?—Mr. MYERS describes in detail the provisions made in Massachusetts to prevent overcapitalization of corporations. (See below.) He points out, however, that the main purpose sought in that State has been to protect the consuming public from overcharge and not to protect investors from fraud or abuse. So far as Massachusetts corporations are concerned, the investor is, to be sure, quite thoroughly protected, but it is impossible for the State to prevent its citizens, if they see fit to do so, from investing in the shares of corporations organized in other States which are overcapitalized and fraudulent. It is perhaps best that people should learn by experience to care for themselves in regard to their investments. Nevertheless, the witness believes that if it were possible for all the States to adopt laws similar to those of Massachusetts for the prevention of overcapitalization, or if Federal laws on the subject could constitutionally be adopted, investors would be benefited and the result would be a desirable one. (1137, 1138.)

Mr. LUYTJES, an independent distiller, believes that the Government should look more carefully into the affairs of trusts, requiring them to submit to examination and publish clear and truthful statements. Speculation by officers and unwarranted statements in prospectuses and reports of great corporations are among their chief evils. They should make some return to the public in the way of information for the privilege of incorporation and listing on the stock exchanges. (258.)

Mr. Dos Passos believes that undue interference by legislation for the protection of investors is undesirable, although he is willing to concede the advantage of a certain degree of protection. It is true that some corporations are formed largely for speculative purposes and are overcapitalized, but the witness does not consider this true in any of the recent combinations. Overcapitalization will largely remedy itself by the evident failure of corporations to pay reasonable dividends.

The witness believes that wherever common stock is given as a bonus, without charge, to persons taking preferred stock at par, this may be considered, in a sense, overcapitalization, although the bonus may be based upon what may fairly be anticipated as the profits from the combination, through cheaper production and otherwise.

Mr. Dos Passos believes that it would be advantageous in most cases to require the articles of incorporation of companies to state how much stock is issued for patents, trade-marks, and good will. He does not believe that such an act would in any degree diminish the formation of speculative companies, as is shown by the experience of England, where the laws are strict. It is impossible to guarantee

to the investor that he will make money, especially if he is foolish in his investments. (1166, 1167, 1170.)

The common law also, Mr. Dos Passos declares, offers ample protection to investors and stockholders. If a person is damaged or defrauded by any act of a corporation, or by its promoters or officers, as, for example, by any false or fraudulent statement or suppression of truth in a prospectus, he has the common-law remedy for fraud, both civilly and criminally. For a corporation to declare a dividend which it has not earned is a misdemeanor in certain States. (1154, 1163, 1175, 1176.)

Mr. KING does not consider it desirable that the statutes should require that the precise value of all properties, in detail, which are taken as payment for stock, should be stated in the articles of incorporation. The value of patents, for example, often can not be even roughly estimated in advance. (1108-1110.)

D. Existing provisions as to payment of capital.—*New Jersey law.*—Mr. DILL states that the law of New Jersey is more stringent than that of most States in regard to the payment of capital. It does not permit stock to be issued, as in New York, Delaware, and West Virginia, for that exceedingly indefinite quantity—services. The promoter's idea of the value of his services is largely dependent on how much water he wants to put into the stock. The New Jersey law does permit stock to be issued in exchange for property, but the valuation of the property must be a fair one, and the proportion of property taken for stock must be shown by the records. In case of fraudulent overvaluation of property all the stockholders are held liable for the difference between the real and the actual value, any creditor or stockholder being entitled to bring suit.

No company in New Jersey can commence business with less than \$1,000 of capital actually paid in. As soon as any additional stock is issued or paid in, a sworn certificate must be filed by the officers of the corporation, stating the amount, and the proportion of property and of cash paid. (1080-1082.)

2. West Virginia law.—Mr. NEVINS, secretary of the Corporation Trust Company of West Virginia, describes the provisions of the West Virginia laws.

The maximum limit of capital for any corporation is \$5,000,000. The witness believes that few corporations need a larger capital than this, and that the restriction prevents the formation of consolidated corporations in the nature of trusts.

The articles of incorporation must state—what is not required by the laws of some other States—the amount of capital subscribed by each incorporator and the total amount subscribed, as distinguished from the authorized capital, which is also named. The proportion of the subscription which has been paid in must also be stated, and this must be at least 10 per cent of the amount subscribed. This, according to Mr. Nevins, prevents reckless subscription. There is no requirement as to the time when the remaining stock must be paid in, but naturally the company can not carry on a large business unless enough money is actually paid in.

There is no specific provision in the law requiring that stock shall be paid for in cash, and the courts hold that property or services may be taken. Their value would be determined by the board of directors, but the common law rule that the transaction must be in good faith must be observed.

The liability of stockholders is merely for stock which they own, except in the case of money corporations. (1115-1118.)

3. Delaware law.—No charter may be granted in Delaware to a company with a capital less than \$2,000, and at least \$1,000 must be subscribed, although there is no requirement as to the actual paying in of capital. The constitution authorizes labor and property to be accepted in payment for stock, but prescribes that they shall not be taken for more than the actual value at the time. The legislature has undertaken to say that the judgment of the directors as to the value of property or services, in the absence of fraud, shall be final. The witness does not know whether the courts will consider this latter provision in conformity with the constitution. The law does not require that the certificate of incorporation shall show the number of shares subscribed by the incorporators. (SMITH, 1121.)

E. Regulation of capitalization in Massachusetts.—Mr. MYERS, for the past 5 years chairman of the committee on judiciary in the Massachusetts house of representatives, testifies concerning the provisions of the Massachusetts laws for preventing overcapitalization.

1. General requirements as to capitalization and payment of capital.—The Massachusetts laws have always been stricter than those of most States as to the organization of all classes of corporations. Up to 1899 no company could be created with a capital of over \$1,000,000 without a special act of the legislature, and as a matter of fact only a small number of companies have been formed with over \$1,000,000 capital.

The State has established a commissioner of corporations, who must certify to the correctness of the form of organization. The first statement or form filed must give the amount of capital and the names of the incorporators. Within 30 days, on penalty of liability of every stockholder for the debts of the company, a sworn certificate must be filed that the entire amount of capital stock has actually been paid up, either in cash or in property, the value of which has been duly approved by the commissioner of corporations.

The statute has made no provision for a distinction between preferred and common stock, and the commissioner of corporations has never permitted the issue of these separate classes. There is a provision for the issue of "special stock," but the common stockholders are held liable for every debt of the corporation so long as such special stock is outstanding, so that it is practically never issued.

Mr. Myers believes that a certain number of corporations which would be organized in Massachusetts if the statutes were more liberal go out of the State to incorporate, while the custom of interstate comity allows them thereupon to conduct their business within the State of Massachusetts. The result is some loss of income to the State in taxation, although the tangible property of such corporations within the State is reached by the general property tax. But the witness believes that the advantage of having the entire corporate business of the State done upon a sound basis more than offsets any disadvantage in the way of driving corporations out of the State. (1128, 1129, 1133.)

2. *Capitalization of quasi-public corporations.*—During 1893 and 1894 a strong agitation arose among business men in Massachusetts concerning the possible overcapitalization of quasi-public companies. These companies, which include railway, street railway, gas, electric-light, telephone, and water companies, were conceived by the people to be doing an essentially monopolistic business. It is to the interest of the community that any particular service of this sort should be performed exclusively by a single concern. These lines of business are, in the phrase of economic writers, "natural monopolies." (Owing to this fact they are able to exact excessive charges for their services, unless regulated.)

The State of Massachusetts, for the sake of protecting the consuming public, had already, before this agitation of 1894, sought to control the charges of quasi-public companies to a degree scarcely reached in any other State. These various corporations are required to report to the commissioner of gas companies, railway commissioners, etc., as to the dividends they pay, and as to the details of their earnings. These officers have power to fix rates, or at least to recommend changes in rates, which the force of public opinion practically compels the companies to make.

The belief of those who desired statutes to prevent overcapitalization was that public opinion and State officials might be deceived as to the reasonableness of rates by inflating the capital of companies, so that the rate of dividend, while moderate upon the nominal capital, would be excessive as compared with the actual capital invested. The fundamental idea of the legislation attempted was to supervise the issue of stocks and bonds in such a way as to insure the full payment of the value. The laws are popularly known as the "anti-stock-watering laws."

The first of these statutes provides that no telegraph, telephone, gas, electric-light, steam or street railway, or water company shall declare any stock or scrip dividend, or divide the proceeds of the sale of any stock or scrip among its stockholders, or create any additional stock unless the par value is paid in cash to the treasurer. Three other acts provide for supervision by different State authorities as to issues of stock. Thus, in the case of gas and electric companies, it is provided that only such amounts of stock and bonds may be issued as the board of gas and electric-light commissioners shall, by formal vote, declare to be requisite. The specific amounts authorized for each purpose must be set forth in this vote of the board, and no company shall apply the proceeds of such stocks or bonds to any purpose not thus specified. (1128-1130, 1135.)

3. *Foreign corporations.*—It was feared that the provisions of the above statutes might be evaded by arrangement with foreign corporations. Thus, a foreign corporation might secure possession of the stocks and bonds of local companies, and issue its own obligations on the basis of these underlying stocks and bonds. It was accordingly enacted that if any foreign corporation owning or controlling a majority of the capital of any domestic corporation should thereafter issue stocks or bonds, based upon the property or stock of such domestic corporation, the supreme judicial court might, in its discretion, dissolve the domestic corporation. (1131.)

4. *Evasion of law by means of trusts.*—Mr. MYERS states that these restrictions to prevent overcapitalization have been of late, to some extent, evaded by the device of putting the majority or all of the shares of a company into the hands of

trustees, who issue certificates. There is no provision of the law to prevent the issue of such certificates in excess of the amount of securities held, nor does the witness know of any satisfactory method by which such an arrangement can be prevented. The evil may, perhaps, be reached by a public uprising similar to that which brought about the present laws. (1131, 1135.)

5. *Consolidation of railways and street railways.*—Another form of overcapitalization, which is especially likely to occur in the case of railways and street railways, is in connection with consolidations of different lines by purchase or lease. Thus, a street railway company may be leased to another company, the latter agreeing to pay 10 per cent upon its capital as a rental. This becomes a fixed charge, and the lessee company may plead it as such in defense of higher fares. To avoid this abuse, a provision of the Massachusetts laws requires that all consolidations of railways and street railways, in whatever form, must receive the approval of the board of railroad commissioners, after public hearing. An expert values the property of each company and the commissioners restrict the rates of rental, or the number of shares of the consolidated company which may be issued. (1131, 1132.)

6. *New stock not to be sold under market value.*—Still a further provision of the Massachusetts laws is that, when the shares of any company are worth more than par, new shares are not to be issued simply at par, but must be sold at auction at the market price. If the shares should be issued at par to the stockholders, this would amount to a capitalization of accumulated earnings. Accordingly, when such new shares are issued, the various boards having control of the different classes of corporations are authorized to ascertain what the market value is, and to prevent the issue of shares at less than that value. In this way the corporation secures an amount of money upon its shares equal to the fair value of the stock issued. (1132.)

F. *English and German regulations as to promotion and capitalization.*—Mr. DILL, a lawyer of New York, testifies that the English laws concerning corporations are considerably in advance of any in this country, although those of New Jersey follow some of the most important provisions of the foreign statutes. The English law requires that all stock, into whosever hands it may come, shall be deemed subject to be paid in full in cash unless, before the stock is issued, a contract, open to the public, has been filed, showing which part of the stock has been issued for cash, which for property, and the character and value of the property thus taken. The witness believes that some such provision should be made in all corporation laws. The degree of publicity thus required, however, is still insufficient, and bills are now pending before the British Parliament providing, first, that every statement contained in every prospectus or promotion scheme shall be deemed to refer to money unless otherwise stated; second, that every director and officer of the company shall be held personally liable for all statements or prospectuses issued, this responsibility extending to the failure to state material facts, as well as to direct misrepresentation. The effect of such restrictions as these in the United States, Mr. Dill believes, would be to drive out many illegitimate companies. (1082, 1083.)

Mr. LUTYIES states that in Germany the law makes every promoter of a corporation responsible for the truth of the statements he makes in advertising. The minority of corporation stockholders are also given much greater power than in this country. Speculation by officers and other mismanagement is carefully restricted. (257.)

G. *Corporate shares without nominal value.*—Mr. STETSON, a corporation lawyer of New York, advocates a proposal made by a committee of the Bar Association of New York in 1892, although it was never acted upon by that association. This was to permit the formation of a class of business corporations, "whose capital stock may be issued as representing proportional parts of the whole capital without any nominal or money value." The interests or shares of the members would thus be represented by a statement of the proportion of the total property, and not by an arbitrary assignment of money value, which is delusive wherever capital stock has a market value either more or less than par.

One of the chief purposes of corporations in establishing a very large capital is to get a large common divisor, so that many persons may be interested in the enterprise, and the nominal value of each share is of very slight consequence. No one deals in shares with reference to par, although sometimes the facts in the case are obscured by this assignment of nominal value. (976.)

TESTIMONY.

INDUSTRIAL COMMISSION.

TRUSTS AND INDUSTRIAL COMBINATIONS.

WASHINGTON, D. C., April 7, 1899.

TESTIMONY OF MR. F. B. THURBER,

President United States Export Association.

The commission met at 10.45 a. m., Vice-Chairman Phillips presiding. Mr. F. B. Thurber, President of the United States Export Association, appeared and testified on the subject of industrial combinations.

Mr. THURBER. Mr. Chairman and members of the Industrial Commission: In the first place I wish to thank you for hearing me to-day, because it will not be possible for me to be here next month. That was the reason I requested to be heard to-day, if possible. In order that I might be reasonably brief and not take up more of your time than necessary, I have put on paper substantially what I have to say. It may suggest some questions concerning the subject in hand. With your permission I will read it to you.

I thought that my remarks would come within that department which Mr. Jenks has been working up for you in regard to the organization of industries into trusts, etc. I might say incidentally that I met Mr. Jenks at Albany, N. Y., some weeks ago, and he told me you had employed him to work up this question of the organization of industries into trusts and its effects upon commerce and the public interest, and expressed the wish that I put together the ideas which I had expressed from time to time upon the subject. (Reading:)

THE ORGANIZATION OF INDUSTRY—ITS EFFECT UPON LABOR, CAPITAL, AND THE PUBLIC INTEREST.

For many years as a merchant, and more recently as President of the United States Export Association, I have studied the effect of aggregations of capital commonly known as "trusts" upon our commercial, industrial, and political system. I may say that when I began it was with a strong prejudice against them. I believed that they would tend to oppress the public with high prices and also that their political influence was to be feared. I had no conception that they were a natural economic development consequent on the development of the great forces which now control the world—steam, electricity, and machinery—or that there was any rational basis for their existence. But a careful study of their effect, ranging over a period of years, has materially modified my opinion.

The best horse will shy at an umbrella if it is opened in his face too suddenly, and the economic results of these great forces have been so sudden and startling that it is perhaps natural that even intelligent men should "shy" at them until, like the horse, they can smell of them and see that they are not dangerous. The "trust" is a result of these forces.

TRANSPORT BEFORE THE INDUSTRIAL COMMISSION.

COMBINATIONS AMONG RAILROADS THE FIRST TRUST.

The first prominent development of the trust organization in this country was in the consolidation of numerous lines of railroad into trunk lines, and there was a fear in the public mind (in which I shared) that these combinations and consolidations would result in exorbitant rates for transportation and to the detriment of the public interest. What the result has been is shown by the following extract from a report adopted by the National Board of Trade at its annual convention in 1896:

"The average charge for sending a ton of freight 1 mile on 13 of the most important railroads in the United States during 1865 was 3.08 cents; in 1870, 1.90 cents; in 1875, 1.36 cents; in 1880, 1.01 cents; in 1885, 0.83 cent; in 1890, 0.77 cent; in 1893, 0.76 cent; in 1894, 0.746 cent, and in 1895, 0.720 cent. Since 1865 the figures have not varied so largely, but have shown a constant tendency downward."

These railroads performed one-third of the entire transportation of 1895, and from the figures given it appears that 0.72 cent would pay for as much transportation over their lines in 1895 as could have been obtained for 3.08 cents 30 years earlier.

This reduction, amounting to three-quarters of the average rate of 1865, was exceeded by the reduction in price of but few even of those articles in the manufacture of which new inventions have worked the most radical changes. The entire transportation performed by the railroads of the United States during the 12 years ending June 30, 1894, was equivalent to moving 136,790,877,822 passengers and 807,935,882,688 tons of freight 1 mile. Had rates averaging as high as those of 1862 been collected on this traffic, the railroads would have earned \$2,629,043,459 more than they actually received.

THE STANDARD OIL TRUST.

The next most prominent aggregation of capital in the commercial world is known as the Standard Oil Company, and the effect upon the price of oil is illustrated by the following statistics, compiled by the United States Government, showing the wholesale export price for refined petroleum for the period extending from 1871 to 1898:

Prices of refined illuminating oils per gallon exported from the United States, 1871 to 1898. (The prices represent the market value of article at time of exportation.)

This great decline in the price of oil is attributable partly to the increase in production, but more largely to improvements in manufacture and transportation, which were only attainable through the aggregation of capital in this industry.

THE SUGAR TRUST.

Among the more prominent of the recent so-called trusts is that of the American Sugar Refining Company, which is a corporation formed under the laws of the State of New Jersey for the purpose of consolidating the sugar-refining interests of the country, and until recently, when additional capital flowed into this channel, it did about 85 per cent of the sugar-refining business in the United States. The effect of this is shown by the following table, giving the price of both raw and refined sugar, with the different margins during the 9 years prior to the consolidation and 9 years since.

Average price.

Year.	Centrifugals, raw, per pound.	Granulated, refined, per pound.	Difference, per pound.	Year.	Centrifugals, raw, per pound.	Granulated, refined, per pound.	Difference, per pound.
	<i>Cents.</i>	<i>Cents.</i>	<i>Cents.</i>		<i>Cents.</i>	<i>Cents.</i>	<i>Cents.</i>
1879	7.423	8.735	1.312	1888	5.749	7.007	1.258
1880	8.206	9.602	1.396	1889	6.493	7.640	1.207
1881	8.251	9.687	1.416	1890	5.451	6.171	0.720
1882	7.797	9.294	1.437	1891	3.863	4.661	0.823
1883	7.423	8.506	1.083	1892	3.311	4.346	1.035
1884	5.857	6.780	0.923	1893	3.689	4.842	1.153
1885	5.729	6.441	0.712	1894	3.235	4.119	0.884
1886	5.336	6.117	0.781	1895	3.256	4.140	0.882
1887 a	5.245	6.013	0.768	1896	3.631	4.539	0.908
Average, 9 years	6.807	7.905	1.098	Average, 9 years	4.291	5.272	0.981

a The trust was formed in 1887.

Since 1896 prices have been affected by changes in the tariff, and during the past few months by increased competition consequent upon the construction of new refineries, which have reduced margins to an absolutely unremunerative point. The figures for 1897 and 1898 are as follows:

Year.	Centrifugals, raw, per pound.	Granulated, refined, per pound.	Difference, per pound.
	<i>Cents.</i>	<i>Cents.</i>	<i>Cents.</i>
1897	3.550	4.500	0.950
1898	4.240	4.970	0.730
March 30, 1899	4.370	4.940	0.570

This reduction in price has been effected partly by increased production and largely through buying the raw material cheaper than when a large number of separate refiners were competing for the product. Large economies were also effected by closing inferior plants and enlarging and extending superior ones. The American Sugar Refining Company has bought its raw material cheap, but it has given the public the benefit of such purchases, merely retaining as its profit about one-third of a cent per pound, which, considering the nature of the business, is a reasonable one. It employs more labor and pays higher wages than was employed and paid before the organization of this industry.

EFFECTS OF THIS INDUSTRIAL REVOLUTION ON LABOR AND PROFITS.

These illustrations are but types of many in the evolution of industries, which is the result of the great forces before mentioned, and which have revolutionized the entire economic situation. That there have been instances of hardship and injustice attending this revolution can not be doubted, but it is equally certain that the total results have been beneficial to the public at large and to the interests of the laboring classes especially, who constitute the majority. At some stages of this evolution this remark was, perhaps, not true. The action of these forces was so rapid that men were thrown out of employment faster than wants were created and industries widened. Labor, however, soon followed the example of organization which capital had set, and during the last decade the organization of labor has progressed faster than that of capital, and has forced a division of a larger share of the profits of industry for labor than at any previous period of history. In other words, the profits of capital have been steadily decreasing, while those of labor, and especially of organized labor, have steadily increased. At no previous period would a dollar buy so much of the necessities and comforts of life as at present. While this is admitted by intelligent laboring men, many of them contend that opportunities for earning a dollar have constantly diminished; and they are now seeking, by the advocacy of shorter hours for labor, to make employment for a larger number of persons. I believe that this is a worthy

and beneficent aim. It is better to have a larger number of persons employed for 8 hours than a smaller number of persons 10 or 12 hours. Unrest of labor in a free country is not a dangerous phenomenon, but rather a safety valve, and one which capital can afford to encourage. At the same time it must not be forgotten that education of the masses has created new wants, and that these wants have grown faster than the means of gratifying them. The problem should be viewed from both sides, and only what is reasonable should prevail. Wherever unlimited power exists it is usually accompanied by tyranny, whether of labor or capital. There are labor trusts as well as capital trusts, and in all the annals of combination there are no greater illustrations of tyranny than the attitude of some of the labor organizations toward laborers. This, however, was the inevitable outcome of organization and of the evolution which is now going on throughout the world under the operation of the great forces that now control the world—steam, electricity, and machinery. Under the operation of these forces the world has been growing richer. All the resources of nature are being developed. Capital has increased faster than the opportunities for its profitable employment, as is evidenced by the steadily decreasing rate of interest. I used to think that combinations of capital would abrogate competition, but experience has shown that, instead of abrogating competition, it has elevated that force to a higher plane. If a combination of capital in any line temporarily exacts a liberal profit, immediately capital flows into that channel, another combination is formed, and competition ensues on a scale and operates with an intensity far beyond anything that is possible on a smaller scale, resulting in the breaking down of the combination and the decline of profits to a minimum.

TENDENCY OF PROFITS TO A MINIMUM ILLUSTRATED BY THE SUGAR AND COFFEE INDUSTRIES.

A striking illustration of this is found in the sugar and coffee industries to-day. Arbuckle Brothers had attained a commanding position as roasters and sellers of coffee, and they also sold but did not refine sugars. Because the American Sugar Refining Company would not sell to them cheaper than to other buyers of sugar, they decided to go into the sugar-refining business, whereupon leading spirits in the American Sugar Refining Company, seeing that the margin of profit in the coffee business was good, decided to go into roasting and selling coffee. The result has been that this contest of giants has reduced the profits in both industries to a minimum, if not to a positive loss, making it hard for smaller manufacturers and dealers to live, but saving millions of dollars for consumers that would otherwise have inured to manufacturers and dealers.

COMPETITION AND PUBLICITY SAFEGUARDS TO CONSUMERS AND STOCKHOLDERS.

The only trusts which have succeeded for any length of time have been those which have been conducted on a far-sighted basis of moderate margins of profit, relying upon a large turn over and the economies resulting from the command of large capital intelligently administered. The truth of this is illustrated by innumerable failures in trust organizations to control prices, recent illustrations of which are the strawboard trust, the starch trust, the wire-nail trust, and the old steel trust. There are trusts, so called, in nearly every branch of business, and there is good and bad in all, but the good so far predominates that such aggregations of capital should be encouraged, accompanied by safeguards against abuses. The only additional safeguards needed are for stockholders and investors, whose interests are often sacrificed through lack of publicity. The average investor is the chief sufferer. So far as the interest of consumers is concerned, it is amply protected now—first, by competition, as I have shown, and second, by the common law, which, if invoked, will nullify any contract in restraint of trade and subject any unreasonable combination to indictment for conspiracy. Special "trust" statutes are not necessary, although many have been enacted.

OVERCAPITALIZATION.

The evil of overcapitalization is often condemned, and no doubt it is an evil, but it hurts its authors as often as it does investors, although, perhaps, not to the same extent. It is very difficult to estimate actual values where earning power is such a large factor, and this, as is well known, varies greatly with the changing conditions of trade. At present trade is good, money is easy, and we see great activity in the formation of "trusts" with enormous capitalizations, whose

value only time can prove; but it is safe to say that there will come periods of business depression when it will not be possible to earn dividends, and these securities will find their level.

A large capitalization can not increase earning power, but it may serve to conceal the percentage of earnings on the actual cost of some properties and furnish counters with which to juggle in the stock market. In many industrial properties the "good will," which is a property created by brains, industry, time, and population, is the principal value. Unlike a railroad or gas company this can not be reproduced, and the sole measure of capitalization is its earning power. What other measure can there be to the capitalization of a newspaper or ordinary industrial company? Never before has there been so much necessity for caution and investigation on the part of investors. This is illustrated by the following from a recent circular of Messrs. Watson & Gibson, a leading firm of bankers and brokers in New York:

OPINION CONCERNING INDUSTRIAL STOCKS.

"The manufacture of securities goes on so rapidly now that 'the Street,' literally the street, is full of them, as the stock exchange can not list them as fast as they come out. There never has been such a 'curb' market before. The list is a long and growing one. Wall street has got to educate itself in a variety of industries. It used to study railroading and transportation only, paying but little attention to the methods, details, and statistics of individual industries. In the near future we must inform ourselves in a general way, at least, as to steel billets, barbed wire, freight cars, paper bags, baking powder, electric and air power cars, passenger and freight elevators, hard-rubber goods, typewriting machines, smelters, cigars, cigarettes, beet-root sugar, pumps, potteries, etc. Our horizon is widening; we are getting expansion in Wall street, and getting it all at once. Bankers and brokers are looking over these new candidates for loans and marginal accounts, and are proceeding with great caution. They are not so enthusiastic as the promoters of these various consolidations, and therein lies the safety of the situation. If bankers and brokers had joined promoters in their mad craze to overcapitalize, and had aided and abetted them in enticing the public in on easy terms of marginal purchases, the situation would by this time have become dangerous. The industrial stocks will have a checkered career. Some will be admitted into the inner circles of credit among bankers, some will stay outside in the cold, many will appeal sooner or later to speculative favor, and finally the test of time will separate the sheep from the goats. It will be difficult to find skilled managers who can successfully conduct the new combinations, and great crashes will come within a year or so that will wreck the whole market. There will be as many Cordages as Standard Oils, and probably more, but we are not yet in their shadow."

STOCK COMPANIES PROMOTE A WIDER DISTRIBUTION OF WEALTH.

The fact remains, however, that stock companies are industrial partnerships, usually composed of a large number of small partners as stockholders, and that both profits and losses are much more widely distributed under this organization of industry than under former conditions.

I will give you an example of that. There were 9 sugar-refining firms consolidated into the American Sugar Refining Company. There was an average of 8 partners to the firm, making 72 persons interested. As soon as it was put into an industrial corporation the number of stockholders began to increase until now they are numbered by the thousands.

INDIVIDUALITY NOT IMPAIRED BY TRUSTS.

The theory has been advanced that the organization of industry into "trusts" dwarfs individual effort and diminishes individual opportunity. I do not think this is true any more than the enlistment of bushwhackers in the Regular Army dwarfs effort and diminishes opportunity. The bravest, wisest, and strongest naturally become officers in the organization of industry, and those less capable become the rank and file, with opportunity for promotion based on merit. Look and opportunity, doubtless, have something to do with leadership, but the fact remains that steam, electricity, and machinery have forced the organization of industry, and it is now a contest of nations for the trade of the world. We can not all be generals or admirals in industrial organization, but we can try for it, and it is better to be a good private than to be an eminent bushwhacker.

Q. (By Representative GARDNER.) That is a matter upon which one hears comments frequently—the opportunities which exist for going into business. It is a common thing to hear men say, "I can not put my son into business. Combines, department stores, trusts, etc., absorb everything." Now, do I understand you to mean that, in the evolution of the world's industry, natural conditions have grown up in all countries which will operate without regard to particular local institutions—in other words, that the evolution is an irresistible one?—A. That is my idea; and I think there is a place for everybody in this new organization of industry, as much so as when it was entirely in the hands of individuals. A man may not be able to put his son into business in a small way on his own account, but he can find a place for him in some large institution which will enable him to have as much scope for his energies and efforts as he would have if working on his own individual account.

Q. It shifts the opportunity, but does not destroy it; that is your theory?—A. That is my theory. (Continues reading.)

The popular hostility to trusts is due principally to lack of knowledge of their economic effects, and these are gradually becoming better known. There have been just enough abuses attending them to give an excuse for sensational journalistic denunciation, and this has caused undue prejudice. A great politico-economic question like this should be considered dispassionately, and all sides of it carefully investigated before conclusions are reached. As before stated, the result of my many years of study of it has been to materially modify the views I entertained in the beginning. The editor of the United States consular reports for August, 1898, in discussing industrial centralization in Europe, says:

THE PRESENT A PERIOD OF CENTRALIZATION IN INDUSTRY.

"Our period is distinguished by its tendency to centralization, not only in the State, but likewise in industry and commerce. Large firms are competing with small shops to such an extent that the latter are disappearing one after another. The factory has displaced the workshops. Everything is being done on a large scale. Everything is becoming colossal. That is not all. We see now even the great factories, not finding themselves sufficiently strong alone, and fearing their reciprocal competition, renouncing their own autonomy and combining among themselves, and this tendency is everywhere manifest. The French *chefs d'affaires* at Berlin calls attention to their centralization in Germany; the French consul at Glasgow mentions the same phenomenon at Glasgow. These facts are significant. They certainly indicate one of the tendencies—perhaps, it might be said, one of the necessities—of our epoch. It is certain that production is passing through a serious crisis. Competition has occasioned a considerable decline in prices, and in order to retain markets certain industries have been obliged to work under unprofitable conditions. To avoid final ruin, they have agreed either to limit the production, to maintain prices, or to conclude complete consolidation. Hence the cartels, the syndicates for production, the associations. We neither approve nor blame this new procedure; we simply record it, remarking that sometimes certain laws are developed, whatever may be their consequence."

TRUSTS TEND TOWARD SOCIALISM.

Q. Perhaps this is the right place to ask whether, in your study of combinations and trusts, you have discovered, together with a tendency toward the development of monopolies in all industries, a tendency toward governmental control of such monopolies; or, in a word, is there a direct tendency to ultimate socialism of some kind, or government ownership of all things?—A. The tendency is undoubtedly in that direction. One of the most intelligent socialists in New York, in an article written for the New York "Independent," welcomed the advent of trusts as a step toward ultimate socialism.

Q. (By Representative LIVINGSTON.) Is it the purpose of trusts and combinations to bring about that result?—A. I do not think it is. I do not think they have that intention at all.

Q. (By Mr. NORTH.) Is that the effect, in your judgment?—A. I think it is a step in that direction. That is the tendency, but the end is a long way off.

Q. (By Mr. FARQUHAR.) Do you think that these combinations tend to the destruction of individualism, as we regard it?—A. No; I do not think they destroy individual character, but they may destroy individual occupation.

Q. Do they destroy individual opportunities?—A. No.

Q. How can there be concentration without, at the same time, the destruction of opportunities?—A. It is just like organizing a militia or an army. I touched upon that, I think, a few moments ago.

Q. (By Representative LIVINGSTON.) What you say would be true if all individuals were taken into the organizations; but if the great masses are left out, what is the effect?—A. Judging from the extent of concentration at the present time, I think it must become general. It is certainly proceeding so fast we can hardly keep track of it.

Q. (By Mr. FARQUHAR.) Is it not a fact that the reason given by the unemployed for their condition is that they are shut out from employment? Is not that the particular explanation, both in Europe and America?—A. Oh, yes; I think it is the reason usually given. (Continues reading.)

INDUSTRIAL CONDITIONS IN GREAT BRITAIN.

The London "Contemporary Review" for March, 1899, contains an article on the tendency toward industrial centralization in British industries, a recent illustration of which is the Bradford Dyers' Association, Limited, embracing twenty-two firms, with a capital of \$22,500,000, and controlling 90 per cent of the local dyeing trade. A similar fusion of interests in the Lancashire bleaching trade, with a capital of \$30,000,000, is contemplated. The fine cotton-spinning trade has begun to organize. Thirty-two firms with a capital of \$20,000,000 in stock and \$10,000,000 in debentures have been organized. In the cotton-thread trade, J. & P. Coats and four other firms consolidated with \$28,000,000 of capital and debentures, and fifteen other firms have been organized into a combination with \$18,750,000 of stock and debentures. All the large establishments engaged in making paper for newspapers have consolidated their interests. In the engineering trade, twenty-four firms have consolidated, with a subscribed capital of over \$70,000,000. Armstrong & Co. absorbed Whitworth & Co., and have a capital of \$21,000,000; and similar consolidations have taken place in metallic bedsteads, spring mattresses, cased tubes, spun mounts, rolled metal, brass wire, metal tubes, iron and brass fenders, china furniture, electrical fittings, marl for pottery ware, common building bricks, and coffin hardware.

In most of these organizations the employers and workmen are also confederated, a feature not common in this country. The employers agree to employ only union labor; the men agree to work for no firm outside of the combination, and for none which cuts prices. A minimum wage is agreed upon, and there is a sliding scale for increases.

Q. (By Representative LIVINGSTON.) What is your observation with regard to organizations of capital, are they arbitrary in their action?—A. Just as much so as organizations of labor. I think human nature is the same in both cases.

Q. You say organized labor is arbitrary in its demands, and admit the same of organized capital?—A. Yes.

Q. You do not refer to organization itself, but to the result of organization?—A. Yes. (Continues reading.) Not only is consolidation going on in manufactures, but also with distributive firms. The capitalization of incorporated stores and trading companies in the grocery, provision, oil, and drug trades during 1896-97 was \$90,000,000. One company has a capital of \$5,000,000, and one of \$12,500,000. These establishments have branches all over the country which are driving individual retailers to the wall. Lipton's Company has 72 branches in London and 181 in the provinces. One tobacco company has 100 branches. In the grocery, tobacco, chemical, and drug branches of the shop trades, the traders are grouped in local associations and federated nationally for various purposes of mutual defense. The main purpose being to prevent extensive competition.

The department store has achieved a greater development in England than in this country, and retailers complain of it as much there as here, and the Scotch retailers have been making an effort to find a remedy through tax legislation.

While within the limits of a hearing like this it is impossible to discuss exhaustively all the varying phases of so large a subject, I have endeavored to present the thoughts which have come to me in a somewhat extended observation and study of the phenomena attending the great economic revolution now in process of development, with the hope that they may suggest some points which are worthy of farther consideration, and which may aid in arriving at wise conclusions.

The following lines from some philosophical poet will be appreciated by the leading minds in the so-called "trust" organizations, who have been the mainstay in our churches and have founded most of our hospitals and universities, and.

possibly, by the proprietors of "popular" journals who make a business of denouncing and vilifying them:

"The sign is bad when folks commence
A-hidin' fault with Providence,
And balkin' 'cause the earth don't shake
At ev'ry prancin' step they take.
No man is great 'tel he can see
How less than little he would be
Ef stripped to self, and stark and bare
He hung his sign out anywhere.

"My doctern is to lay aside
Contentions and be satisfied;
Just do your best, and praise or blame
That follers that counts jest the same.
I've allus noticed grate success
Is mixed with troubles, more or less,
And it's the man who does the best
That gits more kicks than all the rest."

INDUSTRIAL CENTRALIZATION A NECESSITY.

I am not interested in trusts, except as a student of their politico-economic features, but I am satisfied that we must have this organization of industry if we would keep up with the procession in the march for the world's trade. There are 1,440,000,000 people in the world, of which we have 75,000,000, possessing a larger purchasing power than any similar number elsewhere and a larger producing power, because we command the great forces of nature and of brain power embodied in machinery to a greater extent than any other nation.

WE MUST EXTEND OUR FOREIGN MARKETS.

With a consuming power of 75,000,000 we have a producing power of 150,000,000. Our problem is to keep our labor and capital continuously and remuneratively employed by preserving our home market and reaching out for a place to dump our surplus among the other 1,365,000,000, each of whom has some wants.

Q. You say our object should be to keep our home markets. Suppose we produce more than we can consume, what then?—A. We then sell it abroad for any price we can get.

Q. Does that hurt anybody?—A. I do not think it does.

Q. Does it not hurt the producer? I want to know your exact opinion on that. Suppose we produce more wheat than we can consume, and throw it on the market anywhere; is the price raised or lowered?—A. Undoubtedly, if we produce too much, i. e., if we produce in excess of the consumptive demand the world over, the price is reduced, because the price of our wheat is made in Liverpool.

Q. If we should limit production at home, would that enable us to extend our markets abroad?—A. My answer to that is, that we should endeavor to preserve our home markets so far as possible and to extend our foreign markets at the same time, in order to relieve the home markets of our surplus. If we produce a surplus, whether of natural or manufactured products, that surplus presses down on the market and reduces prices to an unremunerative point, and in manufactures causes the closing of factories and the discharge of laborers. The great problem is to keep our labor and capital both employed.

Q. In preserving our home markets are we not competing with foreigners and prejudicing them against us? Do we not suffer on that account?—A. Foreign buyers purchase from us when they can do so to better advantage than elsewhere. While trade follows the flag to some extent, it follows the price list to a much greater extent, and we must do all that we can to extend our markets so that our factories can run continuously. As the producing capacity of our factories is greater than the consuming capacity of the United States, we must look abroad for our markets, else our factories can not run and furnish employment.

Q. Do I understand you to say this, that, as we are an overproducing country, not only in the manufacturing line but in the agricultural line, it should be the policy of this country to extend its markets?—A. Yes.

FOREIGN MARKETS TO BE EXTENDED BY BUILDING UP AN AMERICAN MERCHANT MARINE.

Q. Now, how can that be done and at the same time keep up our home markets?—A. Give us an American merchant marine; let our own ships distribute our own goods. A merchant does not hire a competing merchant's wagons to

distribute his goods, and every steamship company works for its own country just as a railroad works for its terminal points. I blew \$75,000 into the Brazil Steamship Line, because I thought it was a shame that an American merchant should have to send his letters to Brazil by way of Liverpool; and I lost every cent of it, because the policy of our Government at that time was to pay only sea postage, which, on a new route, is nothing. That policy applied on land would stop two-thirds of the mail routes of the United States. We had \$96,000 as a mail pay or subsidy from the Brazilian Government, and our Government gave \$3,200. It did not pay the boat hire in landing the mails at the nine points touched at.

Q. Then you think it necessary, in order to extend our trade and benefit our producers, that we have American bottoms?—A. I do.

PRODUCTS ON WHICH PRICES ARE FIXED IN FOREIGN COUNTRIES.

Q. (By Representative GARDNER.) On what products or manufactures of the United States are the prices fixed in any other country? For instance, it is said that Liverpool fixes the price of our wheat; is that true of any other American product or manufacture?—A. It is true of our agricultural products generally, I think, except perhaps cotton, of which we are the chief producers. It is true of most natural products that are produced in all parts of the world, but it is not true to any great extent of our manufactures. We make thousands of articles in this country so much more useful for the purposes of mankind than what is now being used elsewhere, that if we only bring them to the attention of consumers in all parts of the world they will buy them. The peasant who has been plowing with a crooked stick or reaping with a sickle, the implements employed by him and his forefathers for hundreds of years, is entirely satisfied until he sees a moldboard plow or a modern harvester.

Q. (By Representative LIVINGSTON.) If our agricultural products are larger and their prices are fixed abroad, and the prices of our manufactures are not, will you tell me what advantage the manufacturer has in controlling prices that the agriculturist has not, thus enabling the foreigner to fix the prices of the one and not of the other?—A. I will explain that to you. Take, for instance, a moldboard plow—

Q. Take raw cotton and manufactured cotton?—A. I am explaining the difference between a manufactured article, where fashion comes in, or some use, some patent, or something that gives the manufacturer the control of the price, and an agricultural product. I contend that \$1,000,000 of manufactures exported are of more value in actual profit to the country than \$5,000,000 of natural products. As a rule, \$1,000,000 of manufactured products will pay as much profit as \$5,000,000 of natural products, because the margin of profit is fixed by the manufacturer to a great extent, owing to the peculiarities of his goods, the wants of fashion, and all that, which have a very important bearing. (Continues reading.)

SPECIAL EFFORT SHOULD BE MADE TO SPREAD A KNOWLEDGE OF OUR PRODUCTS ABROAD.

There are natural wants and educational wants. The former are principally those of the stomach, and in supplying these we have to compete with the fertile lands and cheap labor of the whole world. The educational wants are those of fashion or convenience. This is illustrated by an incident which happened while I was on a trip around the world some years ago. On the voyage from Bombay to Suez, while going down the Red Sea with an English cotton manufacturer who had moved his plant from Manchester to Bombay, and was manufacturing cheap cotton there for the Eastern market, he told me of the great increase in the number of spindles in Bombay, and said that they would soon supply all the cheap cottons used in the East. I had just come from China, where American manufacturers were taking the market for fine cottons, because our fabrics were not loaded with clay, and I said: "Well, if India supplies the cheap goods and America the better goods, what will the Lancashire manufacturers do for a market?" "Oh," said he, "the mother country will open up Africa and make it the fashion to wear breechcloths." "Well," said I, "that is an educational want."

Mr. Chairman and gentlemen, "there is many a truth spoken in jest," and upon the educational wants depends the prosperity of our country. Paris supplies the wants of fashion in woman's dress, the educational want in that line; England, the fashions in men's apparel. We have thousands of inventions so much more convenient and useful than those now used by the people of the world that all our manufacturers have to do is to show them and they will find a market. But the

peasant who has been plowing with a crooked stick or reaping with a sickle is satisfied until he has seen a moldboard plow or a modern harvester; the student, with the olive-oil lamp or the tallow dip, until he has seen the petroleum, gas, acetylene, or electric light; the wooden-shod cloghopper or the sandal-shod Oriental, with his footwear, until he has seen that artistic and comfortable triumph of machinery, the American shoe.

The same methods which we employ in introducing goods in the United States we must employ abroad. Publicity is the great factor; and this must be reached by the printing press in the language of the various countries, by the personal representation of educated experts able to overcome the barrier of language imposed at the building of the Tower of Babel, by cutting canals and laying cables, by the upbuilding of an American commercial marine which will carry our flag and our goods on every sea, and by the establishing of international banks with a currency which will command the confidence of the great commercial countries of the world. Then will the Star of Empire, first progressing westward, shed its effulgence over the whole world. With it, in time, will come a universal coinage, a universal system of weights and measures, and a universal language; and Tennyson's dream of "the parliament of man, the federation of the world," with the English speaking race, led by the universal Yankee nation, as the evangel, will be realized. But don't let us shy at the boggy of the organization of capital, now called "trusts," which are an evolution of commerce, as natural and irresistible as the tides. Steer them! Don't try to stop them, for they are necessary to economical production and distribution. Regulate them, temper them with the organization of labor, and work out "the greatest good to the greatest number" on a basis of what is reasonable.

THE RELATIONS OF LABOR AND CAPITAL THE GREAT PROBLEM.

The adjustments of the relations of labor and capital under these new conditions is one of the great problems to be solved. Time will not permit discussing them here; but I would recommend every thoughtful man, whether he be an employer or an employee, to read a book recently published on this subject, entitled, *The Laborer and the Capitalist*, by F. O. Willey. It is a powerful argument for harmony, and a prominent clergyman recently said of it that it was capable of doing more good than any other book except the Bible. Our motto should be, "Labor and capital—allies, not enemies; justice for both."

TRUSTS REDUCE THE PRICE OF RAW MATERIALS.

Q. (By Mr. C. J. HARRIS.) Did I understand you to say that the effect of trusts is to reduce the price of raw materials?—A. Yes; as a rule they buy their raw material cheaper than the individual.

Q. In what instances did you say that had been done?—A. The American Sugar Refining Company furnishes a remarkable illustration of that. When a large number of refineries were competing for the raw sugar they naturally bid against one another and paid a much higher price than would have been paid by a smaller number of buyers. With a small number of buyers there is less competition for supplies.

Q. Am I to understand, then, that these corporations eliminate competition in the purchase of raw products and supplies?—A. Yes; they undoubtedly do, to some extent.

Q. What is their effect on the producers of raw material? Is it beneficial or otherwise?—A. It is otherwise.

Q. Then there is one large class you eliminate by trusts, do you not?—A. Yes; but, on the other hand, taking the instance of raw sugar, we find that the price in 1879 was a little over 7 cents, while in 1896 it was a little over 8½ cents. Now that undoubtedly has been to the detriment of the sugar producer—

Q. And the best producers of our country?—A. Yes, and against their interests, too, although they are in a measure free from the dictation of the refineries, because a large part of what they make is suitable for consumption without further refining.

Q. Does not the same condition of affairs exist in regard to the corn producers and the whiskey trust?—A. I do not think the whiskey business is sufficiently concentrated to have that effect; but if it were more concentrated, the effect, then, would unquestionably be the same.

Q. It certainly does in the case of the Standard Oil Company and the oil well producers, does it not? Is not the Standard's control of the industry sufficient to prevent the raw producers, the oil well men, from enjoying any competition to speak of?—A. I think that is true to a great extent, but there has been some com-

position even with the Standard Oil Company, notwithstanding it is such an all-embracing organization.

Q. Would not any capitalistic combination controlling three-fourths of the trade in an industry be able to effect the removal of competition?—A. Undoubtedly, as to the purchase of raw material.

Q. Then we come to the middle class of the country; we will say there are hundred men owning refineries in different parts of the country, living in those communities, having their homes there and their plants here and there—do not all these capitalistic concentrations, or whatever you may call them, remove all these dividends and center them in some large capitalist city like New York?—A. No, I think not. There is a striking illustration of this in the condition of the small coffee roasters in the instance that I cited in this paper where there came a contest between the American Sugar Refining Company, who went into coffee roasting and distribution, and the Arbuckles, who went into sugar refining. It made it very hard for the smaller men. As I said here, "The result has been that this contest of giants has reduced the profits in both industries to a minimum, if not to a positive loss, making it hard for smaller manufacturers and dealers to live, but saving millions of dollars for consumers that would have otherwise inured to manufacturers and dealers."

Q. Are you not looking at these trusts in the light of their money-making capacity rather than of their benefits to the community at large?—A. No, I think not. I am not interested in them pecuniarily. I have tried to look at them from an absolutely impartial point of view. I may not succeed in doing that, but the sum of my feelings is, that the trusts have greatly reduced cost of production and resulted in a benefit to the consumer. They are absolutely in the interest of the consumer, though, as far as the producer is concerned, I think they are antagonistic, because, as was brought out a little while ago, there is a less wide market for the producer.

Q. (By Mr. NORTH.) Are not the producer and consumer one and the same?—A. They are, to a certain extent; all producers are consumers to some extent; but the producers of raw sugar are scattered all over the world. When they could send here and have a dozen buyers, they could get a better price, perhaps, than they can now when there are only two or three buyers, because these two or three can get together and fix the price they will pay. The result is that the raw supplies are bought cheaper than they could be without consolidation.

THE SUGAR TRUST AND THE WHOLESALE GROCERS.

Q. (By Mr. C. J. HARRIS.) Can you, as a wholesale grocer, buy sugar of anyone but the American Sugar Refining Company?—A. Oh, yes; the American Sugar Refining Company is the largest producer; then comes, perhaps, the new refinery of the Arbuckles; and then the Doschers, Mollenhauer, and the Union Refinery. For three years past we have had three sources of supply, now we have five.

Q. Suppose you bought of some other company than the American Sugar Refining Company, would there be any effect on your business as far as they are concerned?—A. Not the slightest. There is no dictation or coercion.

Q. Can you still retain the same rebates, or commissions, or whatever you call them?—A. Yes; precisely. In this respect there has been a misapprehension on the part of the public concerning the American Sugar Refining Company. Competition in the distribution of sugar became sometime ago so intense in the grocery trade that the dealers were distributing it, not only without profit, but for less than the actual cost of doing the work; so the grocers got together—they have always been more or less associated—and asked the American Sugar Refining Company to assist them in securing a fair reward for the work they were doing. It was pointed out that it would be to the interest of the company to have the trade in a solvent, rather than an insolvent, condition and they were asked to make an arrangement, fixing the price at which the grocers should sell, and providing for a commission or rebate to them for doing the business. They hung off for a year or more, and it was only when the margin of profit was absolutely wiped out that the grocers by keeping after them finally succeeded in securing such an arrangement. Immediately some of the newspapers came out with the charge that there had been a great grocers' trust formed in the interest of the American Sugar Refining Company; whereas, the truth is, the grocers had had the hardest possible job to talk them into making the "factor system," as it is called. Even now it costs the average grocer, I think, about 4½ per cent to do business, and he does not get more than about 4 per cent in the distribution of sugar.

Q. As a matter of fact, do you not buy all your sugar from one refining company?—A. I am now out of the grocery business, but I am publishing "The

American Grocer," a newspaper, and I speak from actual knowledge when I say that all of the wholesale grocers buy as they choose from the different concerns. They are not confined to the American Sugar Refining Company. If they buy, for instance, from Dooscher, or Mollenhauer, or Arbuckle, it does not prejudice them in the eyes of the American Sugar Refining Company.

RELATION OF THE AMERICAN SUGAR REFINING COMPANY TO OTHER REFINERS.

Q. Is there any truth in the statement that Mollenhauer and these other refiners have really some connection with the American Sugar Refining Company?—A. I do not think there is the slightest. I will tell you what they all do; they just follow the system of the American Sugar Refining Company as closely as possible, and there has been enough of an outlet, in view of the demand, for the output of all, except the American Sugar Refining Company, which, however, has had sufficient outlet to keep, perhaps two-thirds of their capacity going, and they have been satisfied with that, because it was a great deal better for them to run at two-thirds of their capacity for a margin of profit than it would be to reach out and try to grab all, when they could not succeed.

Q. (By Mr. NORTH.) How is the price of sugar fixed?—A. It is fixed by the refiners. They prepare a regular schedule every day.

Q. In consultation with one another?—A. I do not know whether they have any consultation or not. I know whenever the American Sugar Refining Company puts up a schedule the other refineries will, in most cases, immediately follow suit. Sometimes they will have a little surplus stock they want to work off and will leave their price the same; or, if the American Sugar Refining Company lowers its price, sometimes the other companies will go a little lower still if they have a surplus they want to market.

Q. Notwithstanding what you say, that there are four or five sources of supply, there is still no competition in fixing the price?—A. Yes; I think there is competition to the extent that if one refiner has a surplus stock he will put down his price in order to make it move, and then the others will have to follow suit or else be left with their stocks on hand. To show you how much competition there is at the present time, I would point out that since the Arbuckles got their refinery started, the margin between raw and refined sugars has gone down from 0.95 to 0.57 of a cent.

Q. (By Mr. C. J. HARRIS.) If the Arbuckles and the American Sugar Refining Company carry out your trust principle, they will undoubtedly unite, will they not?—A. They will, if they follow their own interests.

Q. What would be the result, then, on the price of sugar?—A. Immediately you would see the margin go up from 0.57 to 0.95 again.

Q. There would really be no limit to which they could not raise it, would there?—A. Oh, yes. I used to have the idea that where a monopoly was created there would be no competition, and that excessive prices would be charged and the public oppressed; but my observation has been that whenever any combination attempts to get more than a fair, reasonable profit, new capital immediately flows into that line of production, with the result that prices go down. Take, for example, the production of starch, strawboard, and wire nails. The wire-nail manufacturers formed a combination and doubled their price right away. Within six months new factories had been created and were running, and the price was "knocked into a cocked hat." The manufacturers have never been able to get a living profit out of the business since.

METHODS OF THE AMERICAN TOBACCO COMPANY.

Q. In regard to tobacco—you are familiar with that in the grocery line—unless you handle the American Tobacco Company's product exclusively, what is the result?—A. They had a rule that they would give 10 per cent commission or rebate to people who handled their goods exclusively, and only 2½ per cent to those who did not confine themselves exclusively to their manufactures. That was equivalent to making people handle their goods exclusively.

Q. Is that legitimate, according to your ideas of trusts? Is that not in restraint of trade?—A. I think it was within their right to offer an inducement to a dealer to handle and push their goods exclusively. You see it was open to any other dealer to come in.

Q. (By Representative GARDNER.) What is the condition now?—A. I think it is the same now. That is my impression, although having been out of trade for some 8 years, I should not like to speak definitely on that; but I do know this,

TRUSTS AND INDUSTRIAL COMBINATIONS:—THURNER.

11

that they would sell to anybody and offer a premium to a person who would purchase and push their goods and not sell any competing brands, i. e., they would give 10 per cent to him and only 2½ per cent to those dealing also in other brands.

PROFITS AND CAPITAL OF THE SUGAR TRUST.

Q. (By Mr. NORTH.) Are you in position to give the Commission any more definite information than your paper contains regarding the profits of the American Sugar Refining Company?—A. Only as measured by the dividends that they have paid.

Q. Is that the full measure of their profits?—A. No; it is understood they had accumulated a large surplus which they are now using as a fighting fund in the contest with the Arbuckles.

Q. You do not know what that is?—A. No; I think nobody but the directors know.

Q. How many stock dividends have they secured?—A. I think no stock dividends.

Q. (By Mr. SMYTH.) All the dividends are public?—A. Yes; every stockholder of record, of course, participates.

Q. (By Mr. C. J. HARRIS.) What is the capitalization?—A. I think it is now \$75,000,000.

PUBLICITY IN THE BUSINESS OF TRUSTS DESIRABLE.

Q. (By Mr. NORTH.) Do you think that it would be to the public advantage to have a public statement of the security and financial condition of the Sugar Trust and other combinations of the same character?—A. Yes; I think it is a crying need. I think that these great organizations, having the privileges they do, should be put under authority.

Q. Governmental authority?—A. Yes. They are public corporations. They are created by the law, and the law should protect the public against abuses, whether of undue prices or the buncoing of stockholders. You are going to see, within a year or two, a crash in these industrials, in which the resources of thousands and thousands of people who have put their money into these securities will be wiped out; and the only remedy that I can see is such control as will require publicity.

Q. You favor that?—A. Yes.

EFFECT OF TRUSTS AND COMBINATIONS ON LEGISLATION.

Q. (By Representative LIVINGSTON.) What effect have these trusts and combinations had on legislation?—A. Well, I do not know. I am not any more competent to judge of that than any member of this Commission, because I have not given it any special study. There is no doubt about one thing, viz, that there has been a whole lot of "striking" legislation proposed in order to sandbag these trusts, and that whenever they are attacked in that way they will fend off by bribery or anything of that sort. I have not, however, observed that trusts have been active in the way of getting affirmative legislation in their interests.

Q. Do they not always do so when a tax system, financial system, or anything else that affects them is planned?—A. Undoubtedly. For instance, in the formation of the tariff bill you, as well as myself, know that all these large interests employed the very best talent and ability they could to present their side of the question; and we have recently had a discussion in connection with the Canadian reciprocity negotiations in which there has been a great deal of hard talk against the lumbermen for the influence they exerted to prevent the Commission arriving at a conclusion; but I do not think it is wrong for our lumber interests to present, as fully, fairly, and forcibly as possible, the effect of the proposed arrangement on American lumber interests. Certainly the Canadians were not backward in presenting their side, and in former reciprocity treaties there has been nothing reciprocal about Canada.

Q. Are not these combinations, which are being organized and concentrated, able to affect legislation, while the consumers of their products, scattered all over the face of the earth, have no show in that legislation? Do they not in this have an advantage over the majority of the people?—A. I think that all large organizations employ the best talent, and have their cases presented more ably than small ones. But your general question, I think, is answered in the central basic fact that these organizations do reduce the prime cost to the consumer. They have done it, and

CHARACTER OF MANY ANTI-TRUST BILLS.

Q. With reference to do it, and unless there is some instance where they have been so unreasonably and have enforced unreasonable profits I can not say the reason for condemning them. They may have an adverse and striking influence on legislation, but I can not say that I have seen it. When tariff questions have been pending they have undoubtedly presented their interests to the very best of their ability, but I do not see that industries that are in trusts should have any less degree of protection than industries not in trusts.

Q. It was the effect we wanted you to come to, not the facts. We know they lobby, and pay a large amount of money for it. I asked you this question: What effect have they had on these affairs—have they gained anything or lost?—A. I have not noticed any effect against the public interest in that respect.

CHARACTER OF MANY ANTI-TRUST BILLS.

Q. (By Mr. NORTH.) Do I understand you to characterize the anti-trust legislation of the several States as "striking legislation?"—A. I say there have been, undoubtedly, a great many instances where legislative "strikes" were attempted, and where these large organizations have been obliged to fend off.

Q. I would like to have you be a little more particular about that. Do you mean to tell the Commission that you regard the anti-trust legislation of the several States as "striking legislation?"—A. I do not mean to be understood in that way in its particular sense. I do say this: I think it is the experience of every large organization that there are measures introduced for the purpose of being bought off, and that frequently that is done.

Q. Is that the case in our existing legislation, in your judgment?—A. I could not point to any specific case, and it is only a general opinion of mine. Perhaps it may not be well founded, but that is my opinion.

Q. (By Mr. FARQUHAR.) One of the most stubborn fights that has occurred in the New York legislature was against a telephone company, and, as you well recollect, the Board of Trade of New York formed a large committee at its own expense to go to Albany. Was there, so far as you know, a single tinge of the so-called legislative "striking" when that fight was made against the monopoly?—A. No; I think that was an effort of a public body to reduce rates. I can give you some specific illustrations: I was chairman of the gas consumers' organization in New York when the price of gas was very high—\$2.75 a thousand feet—and we felt that the price of gas was too high, and introduced bills to legislate it down, and finally got it down to \$1.25. Then we felt that that was a reasonable price, and stopped. But each year since then there have been bills introduced, by men whose reputation in the legislature was that they were "strikers," to reduce the price of gas further, and the people who were in this association with which I was connected have said that they thought the price of gas was reasonable, and that we ought to do what we could to throw our influence the other way. There were six bills introduced in the legislature of New York this year to reduce the price of gas, some to \$1 and some to 90 cents, and I consider that "striking legislation," from the character of some of the men who introduced it, while others were honest men seeking popularity. I know that the gas companies have been approached with the information that they could stop certain bills if they would say for it.

Q. Do you argue in your own mind that no good can come out of it in that way?—A. I am not too certain of anything.

METHODS OF REGULATING TRUSTS.

Q. (By Mr. NORTH.) You say you think it is necessary that the trusts should be regulated by law. Is it possible, in your judgment, to regulate them by law?—A. I think that you can pass laws requiring reports, which will give sufficient

information to investors to provide against abuses in the manipulation of stocks, which is the chief thing, I think, that is necessary. You will have gathered from my statement that I do not think that the so-called trust statutes which have been introduced are necessary. I think that competition and the common law are sufficient to remedy any real abuses that may be attempted, and that the legislation, both national and State, which is directed against trusts is unnecessary.

Q. But you do believe in the system of publicity and inspection?—A. Yes. See how our banks are supervised and inspected. There is a perfect system. I do not see why that should not be applied to all corporations.

Q. Do you believe that should be applied by the General Government or by the several State Governments?—A. Where the business is an interstate business, it would, perhaps, have to be done by the Federal Government.

Q. Is not every business where the product goes into more than one State an interstate business?—A. Yes, with some qualifications. You know, in the sugar-refining case, a suit was brought against E. C. Knight & Co., of Philadelphia, sugar refiners I think, under the United States trust laws. It was decided in their favor, because they were conducting a business within the State of Pennsylvania. To be sure, their product was shipped all over the United States, but I believe that case was decided on the ground that it was a State institution. I do not know that I am sufficiently familiar with that decision to have in my mind all the varying grounds on which it was decided.

Q. (By Mr. C. J. HARRIS.) I understood it was because it did not come under the interstate clause.—A. That was my understanding.

THE CAPITALIZATION OF TRUSTS.

Q. (By Mr. SMYTH.) Do you think it would be wise to limit by law the capitalization of trusts so that it should not exceed \$5,000,000, \$3,000,000, and so on?—A. I am not clear in my mind what is feasible. You see, the earning power is the thing they capitalize on. They say, how much can this concern earn? Well, it has earned so and so during the last so many years, and will, therefore, stand so much capitalization. If they can figure that it has earned 10 per cent, or is capable of earning 10 per cent, they will capitalize at that. The common stock is, as a rule, a bonus, that is, it is not considered that it represents the actual cost of the thing.

Q. (By Mr. NORTH.) Fictitious?—A. Yes. It may be founded on the earning power, however. The American Sugar Refining Company's common stock has paid 12 per cent right along, and the preferred only 8 per cent, yet I have no doubt that the preferred stock represents about all of the original cost of the plant.

Q. (By Representative GARDNER.) Do you know anything on that point? It is a very ticklish one to assume anything on. You say you have no doubt, but do you know, or have you reasons to know?—A. I have no knowledge on that point. I only know it is a common opinion in the trade that that is the case.

TAXATION OF TRUSTS AND COMBINATIONS.

Q. (By Mr. NORTH.) Would you be willing to subscribe to the proposition that all the profits of a trust or combination, in cases of a certain dividend, should be subject to public taxation?—A. I do not know why you should treat the trust organizations' business any different from others.

Q. Is it because it is quasi-public in so far as it is a monopoly or tends to a monopoly. Is it not different from that of private corporations or individuals doing business in the ordinary, old-fashioned way?—A. In commerce there is no such thing as monopoly in this day and generation. That is one idea that has been exploded. Capital is so plentiful that the moment any institution, no matter how big, begins to exact a liberal profit, immediately fresh capital flows into that channel and competition results on a scale that would not have been possible among smaller organizations.

Q. Then, do I understand you to answer my question in the negative?—A. Yes; I should say that I do not see any reason why business done by corporations should be taxed in any way different from that done by individuals.

Q. Even these quasi-public and quasi-monopolistic corporations?—A. Yes; and if you find that they are oppressive, that they are charging the public more than they should charge it and making enormous profits, that might be a subject for legislation, either through the taxing power or in any other way. But take the American Sugar Refining Company. People say: "Why, they have been paying enormous dividends on an inflated capitalization." So they do; but they do it on an average profit of a third of a cent a pound; but the business is one the machinery of which is not fitted for anything else. If you would subject it to sale—the real estate, machinery, and so on—it would only bring a song; and I think that they are entitled to a good, liberal profit when they give the public the long end of it, as they have done. They have given the public all the benefits of their advantage in buying, and have only retained their average margin right along—about a third of a cent. If they had grabbed the whole thing, why I should feel differently about it; but we must all come down to what is reasonable.

Q. (By Representative GARDNER.) If I understand you, your theory is this: that the elements of competition, viz, capital and individuals with knowledge,

skill, and so on, are practically inexhaustible, and that therefore no monopoly, charging exorbitant prices, can remain without competition for any considerable time?—A. Competition certainly will come.

Q. That is your theory?—A. Yes; and the facts go to show it.

TRUSTS AND COMBINATIONS PROMOTE THE PUBLIC WELFARE.

Q. (By Mr. C. J. HARRIS.) What is going to be the effect of trust organizations on the great middle classes of the community, the men who have formerly been owners of plants, and their sons after them, and what is going to be the effect upon the traveling salesmen?—A. Speaking in a broad way, the effect will be beneficial; although there is a constant displacing and transition in the whole situation. Individuals may be prejudiced as they were in the evolution, for instance, of our transportation system, beginning with the stagecoach and the railroads. It is the old, old story, over and over again, of constant transition and individual hardships; but in the "demnition total" of the whole thing, as Mr. Mantalini said, it is, in my estimation, for the public good, and, what is more, it positively can not be prevented. This state of things has been produced, as I have said, by the forces of steam, electricity, and machinery.

EFFECT OF TRUSTS ON THE DISTRIBUTION OF WEALTH.

Q. Suppose the Standard Oil fortunes, running anywhere from \$10,000,000 to \$200,000,000, which have been showered upon ten or a dozen men, had been divided up among two or three hundred at a million or two apiece, would not the people in general in this country have been a great deal better off, in your estimation?—A. I do not believe they would. You have to have large concentration of wealth in able hands to accomplish results.

Q. Is it not the aim of all sociological writers, who are endeavoring to improve the condition of society, to show that wealth should be as evenly divided as possible? Do not their methods consist in the division of real estate among the thousands, and money and other kinds of property in the same way?—A. You can not have equality in the distribution of wealth. It will inevitably be unequal. If all wealth were equally divided to-day, to-morrow would see a tendency toward inequality again. I saw this thought well expressed in a book by Prof. Isaac F. Russell some time ago: "Equality of wealth would not exist during the period of time required for its distribution. Before midnight some Esau would have sold his birthright for a mess of pottage or some gambler would have staked his last dollar on the throw of a die or the turn of a wheel."

Q. (By Mr. NORTH.) That is your general answer to the socialistic argument, I take it?—A. That equality is impossible.

Q. (By Representative GARDNER.) And is not that the very thing that socialism is aiming at?

Q. (By Mr. FARQUHAR.) Is it not generally said by all historians of this country that the source of our great national prosperity has been our individualistic tendencies; or, in other words, is it not their opinion that the genius of this country is against centralization?—A. No.

Q. Is it not the great freedom of the community in making its own way and its own living the standard that has made American wages?—A. I think you are speaking now in favor of my position—the freedom of opportunity.

Q. I simply would like an answer.—A. I think it is. I think that freedom of opportunity is a most desirable thing, and I think that opportunity is not abridged, as has been suggested by many students, by this new organization of industry. Opportunity appears in a little different way, but opportunity still exists.

REASONS FOR THE REDUCTION OF FREIGHT CHARGES.

Q. You spoke, in what you have read here, about railroad freight going down to 0.72 of a cent in 1895 from 3.08 cents in 1865. Do you credit all that to the controlling of freight rates by trusts and combinations?—A. No; but I credit it to the enormous mechanical improvements that were promoted and made possible by the aggregation of capital in the industry.

Q. What was the increase of railroad capitalization from 1865 to 1895; was it proportional to the decrease in freight charges?—A. No; I do not think there was that amount of increase. There has always been a lot of water, as you know, in our transportation system, but I do not think that the water had anything to do with the decline in rates; it was the mechanical possibilities that were developed by these consolidations.

Q. In other words, you would answer that it was simply the roadbed and the rolling stock and equipment that brought the lower rates? Is it not a fact that

the building of a second lock at Sault Ste. Marie reduced the freight rates on grain from Duluth to Buffalo from 11 cents to 1½ cents?—A. Yes; I think it was; that and mechanical improvements, with the increased tonnage thus made possible.

Q. The extra large tonnage, or carrying power, of all the craft that were built as soon as the great lock was completed?—A. Yes, undoubtedly.

Q. So these trusts and combinations had nothing to do with it, and the cause lay entirely outside of any centralization of capital?—A. It had nothing to do with it in that particular instance, I think, but look at the prices of transportation on the Great Lakes since the Rockefeller capital went into the whaleback transportation. Of course, those whalebacks could not have passed through the old locks, and the enlargement of the locks gave an opportunity for the further employment of this capital. The economies that have been realized in transportation on the lakes through the increased size of vessels and all that have been something enormous.

Q. Is not the development of the lake channels of trade, through river and harbor improvements and better terminal facilities for handling grain and ore and everything of that kind with the resulting competition between water and rail, the reason that rates have come down?—A. Water competition has undoubtedly had a great deal to do with it. At the same time you will admit, I think, that great mechanical improvements, such as the manufacture of Bessemer steel, and the consolidation of railroads, making possible through freights and through lines, as compared with the fragmentary lines we used to have, have had an equally great influence.

Q. Do you think a consolidated pool in the matter of railroad rates sanctioned and regulated by law would be a benefit to the producers of this country as compared with the open competition we have now?—A. I think that a pooling law under supervision of the Interstate Commerce Commission is extremely desirable.

Q. So you believe in State regulation?—A. I do, of all these public agencies.

Q. And do you believe that trusts or combinations are unsafe unless regulated by the State?—A. I think state regulation would be better for the trusts and better for the public.

INDUSTRIAL STOCKS AND SPECULATION.

Q. Another question that you have left quite open suggests itself here. In England, as you know, 10 years ago and throughout the past decade, limited companies have sprung into existence like mushrooms. Is it not a fact that, to-day, the intention of the promoters of trusts, the main part of those formed within the last 3 or 4 months, has been to get their stocks into the New York exchange in order to give them an opportunity to gamble on unknown profits and unknown capitalization?—A. I have no knowledge of that.

Q. Do you not think that Wall street will ultimately reap the benefits instead of the consumer or producer in the speculation on these stocks of the great trusts?—A. Wall street is a very interesting community by itself. It contains the gambling spirit of this country, and whether stocks go up or stocks go down, as among the really active professional stocks, it does not matter a great deal. It is simply one of them skinning another. The real evil in this overcapitalization consists in inducing outside small investors, people who are not speculators, to buy, under such favorable conditions as now exist, securities upon which, when bad times come, dividends can not be earned. Then these smaller investors are practically wiped out unless they can hold over. Indeed, he who buys on a margin is pretty sure to be wiped out.

Q. (By Representative GARDNER.) Does not that result from imprudence just the same as the wasting of money in any other direction? Would that happen if the countryman, or other man, who has a little money and knows enough to know that he does not know anything about it, and ought not to gamble, would stay out of Wall street?—A. Speculation, I suppose, is inevitable; I do not know how to regulate that.

TRUSTS AND PANICS.

Q. (By Mr. FARQUHAR.) I should like to ask whether, in your opinion, these trusts or industrial combinations are for good or evil, as you see them to-day?—A. I believe they are powerful agencies for good, but there is much that is bad which we should try to eliminate; there is "good in all, but none all good."

Q. Is there not a question lying back of this, viz, that, as a result of this overcapitalization and control of natural monopolies as well as of manufactures in general, a crisis may come upon us, such as we have had three or four times in this country?—A. Oh, we are sure to have these periods of panic and reaction, but

how far this overcapitalization, this excessive capitalization, may enhance them or make them come more frequently, I do not know.

Q. (By Mr. NORTH.) But have you not already gone on record on that point in having stated that you believe a panic to be inevitable from these things?—A. What I mean to say is, that I do not know how much a panic would be influenced by this overcapitalization, but I do believe this, that we are likely to have these periods of commercial depression, with all the resulting phenomena of idle mills, etc., more frequently in the future than we have had them in the past unless we can widen our markets and keep up activity in our industries.

Q. But did not I understand you to say before that they would be intensified by this form of industrial combination?—A. As regards panics, do you mean to say?

Q. Business crises, depressions, and prostrations.—A. I do not wish to be understood as thinking that the cause, for the reason that I am not clear that excessive capitalizations are the cause of commercial panics. The real cause is our ability to produce more than we can consume, resulting in the shutting down of our factories and the throwing of labor out of employment, and accompanied by all the phenomena of a commercial crisis which sometimes runs into panic, causing the withdrawal of money from banks, and all that.

Q. In your judgment is it advantageous to the industries of the country to be so capitalized and put upon the New York stock market that they will be subject to all the speculative tendencies which influence that market?—A. I think that excessive capitalization is unfortunate. I believe in having things as near actual values as possible, but I do not see exactly how you are going to prevent overcapitalization.

Q. That is not quite my point; I may not have made it clear. What I mean is this: Does not, in your judgment, the tendency to consolidation bring all the industries of the country affected thereby within a speculative and gambling field?—A. Yes, undoubtedly.

Q. That was the point I was after.—A. Yes, undoubtedly.

Q. That is, it is an economic disadvantage to the country in your judgment?—A. Yes, I think it is.

Q. (By Representative LIVINGSTON.) As an illustration of what you have just said, what produced the recent wonderful change in the Wall street rate of interest, from 3 per cent to 13?—A. Simply demand and supply.

Q. Is it not a fact that bankers in Wall street got frightened, that they were not willing to advance money on the kind of stocks that were being dealt in, and that this fear ran money up to 13 per cent? Was not that the cause of it?—A. I do not know that it was; it may have been. I really do not know that I am competent to answer that question.

THE REGULATION OF TRUSTS RESUMED.

Q. (By Mr. CONGER.) Am I to understand that you believe the general effect of these trusts or industrial combinations is the public good, but that you would favor their regulation by law?—A. Yes.

Q. Would you favor the enactment of a Federal law which would prohibit interstate commerce and the use of interstate commerce instruments, such as checks and drafts, to those corporations not complying with prescribed rules for filing reports or for inspection by the Government, the theory being that publicity will do more to right abuses than anti-trust laws which would annihilate the trust or combination of capital itself?—A. That is a pretty long question. I think a man would have to study on it a long while before he could give an intelligent answer to it.

Q. Take the first part of it; would you favor a Federal law that would prohibit interstate commerce or the use of interstate commerce instruments to those trusts that do not comply with a law requiring the filing of reports—in other words, that regulation which you seem to favor?—A. I do not know whether that would be a proper penalty or not. I think that you can make penalties that perhaps would not interfere with the movement of commerce and at the same time would accomplish the object of giving the necessary publicity. You can make cumulative fines, for instance, for first, second, and third offenses, and make them so heavy that it would be impossible to disregard them.

RESTRICTION OF CAPITALIZATION RESUMED.

Q. Would you favor the enactment of laws prohibiting the capitalization of corporations beyond the amount of money or actual value of property invested?—A. I would not. That brings us to the great difficulty again. Take, for instance, a newspaper that has an earning capacity of \$50,000 a year, and its whole plant is

not worth \$10,000. You would not capitalize that, if you were putting it into a corporation, on any basis of the actual value of the plant. Take almost any private business that is put into a corporation, and its actual tangible merchandise assets with its real estate, etc., is not a fair measure for its capitalization. A fair measure for its capitalization is the earning power of the property. Can it earn 10 per cent on a capital of \$100,000? If so, \$100,000 would be a fair capital for it.

Q. Would you favor a law which would prohibit the capitalization of that property for more than its present value, on your basis of figuring the value? In other words, do you think that it is right and in the interest of the public good to allow the property which is to-day worth \$100,000 to be capitalized for \$200,000 or \$250,000?—A. I think you may base your capital on your earning power. I think that excessive capitalization is an evil, but I do not see how you are going to prevent it, unless you can pass some general law, based on the earning power of the property, that the capitalization shall not exceed so much on its earning power. Perhaps it might be reached in that way, but I have not thought enough upon it to be an authority on that.

Q. Would you favor that law if it could be enforced?—A. I am in favor of any reasonable—

Q. Restriction on capitalization?—A. Restriction on overcapitalization.

TAXATION OF STOCK V. TAXATION OF INCOME.

Q. (By Representative LIVINGSTON.) If the gross income of all organizations of the kind were at first taxed liberally, would not that have a tendency to lessen such organization, make men careful about organizing capital, and do away with the evil of watered stock?—A. A liberal tax on the amount of the stock might have that effect, but I do not think one on the income would. New Jersey has become the home of most of these great organizations, because her organization tax on the big companies is much less than on the smaller ones. In New York State the organization tax is pro rata, and so New Jersey has secured all the big companies.

Q. What, then, do you think a tax should be based on—on the gross income or on the net income?—A. No; I should think that an income—

Q. You think on the stock?—A. I think this overcapitalization might be remedied if you would put the organization tax as high upon large companies as it is upon smaller; make it pro rata; that would tend to keep down capitalization.

Q. If there were a tax on the gross receipts or the net income of the capitalization of these companies, would not that help also to keep it down?—A. On the income? I do not think so; I do not think it would.

Q. I do not want to commit you to an income-tax policy.—A. What I can not see is how an income tax would affect capitalization.

Q. Would it not suppress wild schemes whose success is very improbable? You wish to tax both ways, do you not—to tax the stock and then the gross business?—A. I think a tax on income would be a wrong principle, because it would be a tax on good management, etc. But if you are seeking to remedy overcapitalization, I can see how, if you will put your organization tax so much per thousand, it would kill overcapitalization.

EXPLANATION OF VARIATION IN THE PRICE OF SUGAR.

Q. (By Mr. A. L. HARRIS.) I wish you would return to page 4 of your address just for a moment. I see that in 1881 refined granulated sugar was selling at about 9.66 cents. It then decreased to about 6.01 cents in 1887, when the trust was formed. Immediately after the formation of the trust, in 1888, 1889, and 1890, there was an increase.—A. Yes.

Q. In the price of refined sugar?—A. Yes.

Q. In 1891 it began to decrease, which, as I understand, you have said was on account of these new competing companies coming in. I would like you to explain how it is that there was a constant decrease until the time of the formation of the trust and an increase from the formation of the trust until competing companies came in.—A. Precisely; I will explain that to you. During the period from 1884 to 1887 the sugar-refining industry had gotten down to an unremunerative point. If you will look at the difference between raw and refined during those years you will see it was down to 0.71, 0.78, 0.76, and so on, whereas it had been much higher in the previous years; and you will notice that after the formation of the trust the difference ran up from 0.768 to 1.256 in 1888. Now, the sugar-refining industry had gotten down to the point where 14 refineries had failed, and it was owing to this demoralized state of the industry, making it absolutely

necessary that something be done, that the sugar trust was formed. Then, as you see, for 2 or 3 years they did exact a larger margin of profit, and the price advanced as you have pointed out. But when they got the business into working order, had improved their buying arrangements, and closed up old and inferior plants and enlarged and improved others, you will notice that not only the price goes down steadily, but also the margin between raw and refined sugars.

Q. (By Mr. FARQUHAR.) Were there not just as large profits to the American Sugar Refining Company as there were before they acquired the Philadelphia plants and some others?—A. I think there was a year or two, when they charged more than their regular average; but they soon got down to their regular average, about a third of a cent net, which they have carried all the way through until this more recent competition; and now they are down to 0.57 of a cent, out of which the entire expense of refining must be paid, and that is probably as much as 0.57 of a cent.

Q. Is that the result of the competition of these other refineries you speak of?—A. You know the Arbuckle fight, the coffee and sugar fight, is a very interesting one.

Q. (By Mr. A. L. HARRIS.) Suppose these other organizations had not come into existence, do you think their profits would have been as they have been?—A. Oh, no; they would have kept their margin right along; they would have kept their third of a cent right along.

THE WIRE-NAIL TRUST.

Q. I want to call your attention to one thing more, and that is the wire-nail trust and the wire trust. Has not the price of wire increased about 1 cent on the pound within the last year, since the trust perfected its organization?—A. My understanding of it is that wire and all iron products have increased.

Q. Even steel?—A. Steel of all kinds; but that is due to the industrial situation, I think, and not to the effect of trusts. All our mills are running day and night and can not keep up with their orders. We have always seen that, when there is an active demand, exceeding the supply, prices advance.

Q. And you think that is owing to supply and demand, the natural law of trade?—A. Yes; that is my feeling about it; but at the same time I do not say that new steel combinations have not had some influence upon it. I do not know that they have, but I do know that the supply and demand has more to do with it than anything else.

COMPARISON OF THE EFFECTS OF TRUSTS ON CONSUMERS AND THE PRODUCERS OF RAW MATERIALS.

Q. (By Representative GARDNER.) At one point of our examination here this morning we seemed to reach the conclusion that prices were reduced to the consumer and in turn forced down on the producer. It was asked if the consumer and the producer were not one and the same, and it went at that. Now I wish to ask the witness, as an expert, if he feels competent to answer as such, whether the trust or monopoly buying raw material from one class of persons, but selling to another, does not turn at that point where society is divided into two classes, the consumer and the producer, the price being reduced to the consumer and forced down on the producer? The farmer and the miner produce almost all materials that are in the fullest sense raw materials. The producer and the consumer, therefore, for the purpose of my question, are not the same, because millions of our population who are consumers are not producers in that sense. Therefore, do the operations of the trusts in combining to put down prices to the consumer and in combining to force them down on the producer have a peculiar, specially depressing effect on those two classes, viz, the farmer and the miner?

Q. (By Mr. FARQUHAR.) Why not make it "injure"?

Q. (By Representative GARDNER.) Well, call it "injure".—A. I think that where the number of buyers is reduced to so small a number that there is not competition for the raw material, it tends directly to lessen the sum which the producer of that raw material receives.

IS THE TRUST A NEW ELEMENT IN TRADE DEPRESSION?

Q. One word more in this same line. Remove the influence of the trust in that direction, and would there be, in your judgment, any other organization besides the trust, such as the wool exchange, the cotton exchange, or other board of trade

in the cities, that would exercise some like influence in depressing the price to the farmer and taking the difference for their own profit? That is, is the trust a new element of depression, or does it merely take the place of the cotton exchange, the wool exchange, and other boards of brokers?—A. It may in some industries go directly to the producer, ignoring the middleman, and the producer may get as much for his product as he did before and only the middleman be injured.

Q. You do not exactly comprehend my question. My question was meant to be this: Assuming that the trust buys directly of the producer, and at the lowest possible price, does it even then depress the price below where the woolen exchange and cotton exchange or some other board would have depressed it in the absence of the trust?

Q. (By Representative LIVINGSTON.) Are not these organizations just as bad in effect as the combines?

Q. (By Representative GARDNER.) I want to know whether the wool board and the cotton board that, we read, are fixing the prices of our wool and cotton in Liverpool are not just the same depressive agencies to the farmer that the trust is? I want to know whether the trust is an additional depressor or whether it just takes the place of a former one?—A. I do not think that a general answer can be given to that question. I think it will be necessary to take each specific industry by itself and observe its operations. Now, I am familiar, of course, with the sugar industry. There is no doubt that the producers of sugar in all parts of the world did not receive as much for their sugar after the consolidation of our sugar-refining interests as they did before; and it was due, in my opinion, to the fact that there were not so many competing buyers.

Q. The sugar trust, then, did depress prices to the producer of sugar?—A. I think so.

Q. But as to whether trusts do that for the producers of wool, cotton, and corn you are not prepared to say?—A. No; I should think you would have to take each individual industry and examine it by itself according to its condition.

THE STANDARD OIL TRUST AND PRODUCERS.

Q. (By Mr. PHILLIPS.) How would you answer the same question in regard to petroleum?—A. My impression is that the Standard Oil Company as a whole has been liberal with producers, and paid them as good prices, perhaps, as they could have obtained from a larger number of refiners. Certainly, in the organization of that industry, the result has been beneficial to consumers and to producers alike.

Q. Take, for instance, the pipe-line system through which the oil is chiefly conveyed from the wells to certain stations. The price of pipe was 50 or 60 cents a foot when the lines were built, and they charged 20 cents a barrel for piping the oil. The same sized pipe is now bought for from 12 to 15 cents, and still they are charging the same price per barrel as formerly. As a matter of fact, the oil can be piped for 5 cents a barrel. Now, do you consider that a cheapening to the producer or the consumer?—A. I should say that it was a question of the value of the service that they are rendering. Now, as compared with the freight by rail, the construction of pipe lines has effected an enormous saving; and they could not have been constructed by individuals, but only by some large aggregation of capital. I do not know whether 20 cents is a fair price or not; I have no idea about it; but I do know that the railroads felt that they were greatly injured by the construction of pipe lines, because it reduced their receipts so much.

THE EFFECT OF TRUSTS ON WAGES.

Q. (By Mr. RATCHFORD.) I wish to ask if you have any instance in mind in which a certain trade has paid its employees a certain price for their labor under the system of open competition and then, when the trade was organized as a trust, advanced the prices of its product enormously and at the same time reduced the wages of its employees?—A. I have no recollection of an instance where a trust has advanced the prices of its products and decreased the wages of labor. There may be such instances, but I have none in mind. I do know that the Standard Oil Company, the American Sugar Refining Company, and others have never had trouble with their labor. They pay good wages and get good service and everybody makes money; and at the same time the consumer gets the product at a reasonable price.

Q. (By Mr. SMYTH.) Do you think the American Sugar Refining Company has increased the rate of wages since it became a trust?—A. There is a statement, the sworn evidence of its secretary, Mr. Searles, before the Lexow committee, in which he showed that they had absolutely increased their labor, not in all departments, but as a whole, and that they were employing more men than did the

separate refineries which were consolidated. I do not think that is true in all cases, however, because where industries are spread out and running uneconomically, one of the first things that these combinations do is to reduce expenses in every possible direction. They reduce the number of their employees, if they do not their wages. They cut off their advertising expenses, diminish their selling agency expenses, etc.; so that it does throw people out of employment for the time being, undoubtedly, and forces a constant transition in employment; but the effect of all these great organizations is to widen the market and create more employment, and in the end, speaking broadly, I believe they are beneficial.

GENERAL PRINCIPLES THE SAME FOR ALL TRUSTS.

Q. (By Mr. RATCHFORD.) Is it not a fact that in your advocacy of trusts to-day you have singled out what are known as the most economical trusts—the Standard Oil Company, the American Sugar Refining Company, and our large trunk lines? Is it not a fact that these three have an economic side to them that is not true of other trusts? Or, in other words, that if there be any benefit rendered to society from any form of a trust, the three you have singled out are rendering the greatest possible benefits by the way of cheap products? Is not that the fact?—A. I think the same principles apply to those as apply to others.

Q. Apply to all of them?—A. The same principles apply to all.

Q. Do you believe that the others practice those principles as well as those you have singled out?—A. Perhaps not.

COMBINED EFFECT OF THE CENTRALIZATION OF CAPITAL AND THE ORGANIZATION OF LABOR.

Q. In your paper you have argued in favor of the centralization of capital to the end that the prices of our products may be reduced and our markets thereby extended, and at the same time you have advocated the organization of labor, and stated very emphatically that organized labor has been able to secure higher wages than had been paid heretofore. That being the case, does it not tend to counteract the cheapening of the products and to cripple our ability to gain foreign markets?—A. If it were carried to extremes perhaps it would; but there is reason in all things, and I contend that all these great mooted questions should be solved on a basis of what is reasonable and fair. It sometimes takes a great deal of investigation to find out what that is.

EFFECTS OF TRUSTS ON THE DISTRIBUTION OF WEALTH RESUMED.

Q. In your judgment, does not the centralization of capital in the hands of a few carry with it the concentration of poverty and discontent among the many? In other words, if the wealth of our country is concentrated in the hands of a few persons by reason of organization or other means, does not that deprive the masses of the people of their share of that wealth and cause poverty and discontent among them?—A. As a hypothetical question I should say that perhaps an even distribution of wealth is desirable. As regards trusts, however, they are absolutely distributors of wealth rather than concentrators. The number of small partners engaged in these trusts as stockholders far exceeds the number of partners who owned the firms, factories, or companies that were put into them. As I have stated in my paper, wealth is very much more widely distributed under the trust form of industrial organization than under the old system of individual firms, etc.; very much more. Take, as an illustration, the American Sugar Refining Company; it has thousands of stockholders now where there were formerly 27 partners.

Q. The arguments set forth and the questions asked are simply leading to this proposition: Is it or is it not beneficial to curb the powers of organizations and associations that render impossible the greatest and fullest distribution of wealth? That is the question, it seems to me.—A. As a hypothetical question, I should answer yes; but I am contending that these organizations are doing just the opposite of what your questions seem to imply that they are doing. We differ on the facts, evidently.

STATE OF NEW YORK, *County of New York*:

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

FRANCIS B. THURBER.

Sworn and subscribed before me this 8th day of September, 1899.

[L.s.]

E. N. ROOT, *Notary Public*.

WASHINGTON, D. C., *June 16, 1899.***TESTIMONY OF P. E. DOWE, BEDFORD PARK, NEW YORK CITY.**

The commission met at 2.25 p. m., June 16, 1899, Vice-Chairman Phillips presiding. Mr. P. E. Dowe, after having first duly affirmed, testified.

Q. (By Mr. JENKS.) Will you state your name?—A. P. E. Dowe.

Q. And your address?—A. Bedford Park, New York City.

Q. What is your official position in connection with the Commercial Travelers' Association?—A. President of the Commercial Travelers' National League.

Q. What is your business?—A. Printing-press salesman.

Q. You have a statement, I believe, to present to the commission?—A. Yes; (witness reading):

THE COMMERCIAL TRAVELERS AND TRUSTS.

GENTLEMEN: I feel especially honored that you should have selected me to address you as a representative of the 350,000 commercial travelers of the United States concerning the effect, direct and indirect, of trusts upon them as a class, their influence upon the affairs of travelers from the standpoint of individuals, and as the medium for years between the buyers and manufacturers, jobbers, and importers. Among themselves they are not hesitating, as a rule, to discuss freely the burning question of the day, "trusts" and their menace to the business methods in vogue for many years.

Even those fortunate enough to retain positions (often at reduced salary) in the service of syndicates do not hesitate in safe company to condemn trusts as dangerous to personal privileges and a barrier to individual investment in the line of choice and experience. Every commercial traveler hopes to attain, both as the goal of the ambitious and progressive business man and as an equitable return for years of hard work under trying conditions, a business of his own or in connection with others.

It would be difficult for a stranger to obtain information from the travelers in the employ of trusts, but to me they all talk freely, and I can positively state that commercial travelers generally are opposed to trusts as dangerous and demoralizing, as presenting the most knotty social and the worst financial proposition that has ever been before the American people, and they consider that the next national campaign will be fought upon this issue, anticipating that previous political affiliations will be ignored, all other issues treated as of secondary importance, and a "landslide" for the party standing squarely and consistently upon an antitrust, antimonopoly platform.

DETRIMENTAL TO COMMERCIAL INTERESTS.

I quote the language of one of the brainiest commercial travelers of whom I know, a man whom the Administration has asked to honor, one who won unusual glory for bravery in the civil war, and who has shown his fearlessness in stating his position in regard to trusts. Being asked the question, "What is your opinion concerning trusts and combinations?" he answered: "That they are detrimental to our interests, and all commercial travelers agree to this. The combination of interests upon a square basis and legitimate capitalization is not the only evil; it is the falsehood of inflation, the issuing of stock far beyond the needs for even conducting a trust; that is the cankerworm gnawing at the vitals of commercial integrity; that is the greatest curse, to say nothing of the speculative craze created and the uncertain feeling prevailing in business circles. If it shall continue (the organization of trusts), there will be many traveling men dispensed with, for a while at least, until such time as legislation shall prevent and the demands of the people require a halt to be called. There is no justification in an action the effect of which is to drive out of business the middleman and the ordinary merchant or manufacturer."

Commercial travelers have built up or assisted in building up many a concern which without their labors would have gone to the wall; they have made money for their employers; of that there can be no question; yet several of these houses, which had become powerful factors in their particular lines, were sold out to speculative Shylocks out for the "pound of flesh," and capitalized at many times their intrinsic value, in connection with other properties secured in the same manner; the line of production was cornered and further competition paralyzed;

prices were usually advanced, dictatory methods adopted, and many travelers thrown out of employment and obliged to seek other channels for livelihood, with the avenues in the lines where knowledge, experience, and acquaintance should count the most, closed against them.

THE CHARACTER OF THE TRUST MOVEMENT.

The promoters of trusts, syndicates, monopolies, or combinations, as a rule, spring from Wall street, or are close to its shadow; the existing speculative mania creates inflation bubbles, which ultimately will either break from over-distention, or disappear at the touch of the people.

The organizers of trusts, animated only by selfishness, forgetting Americanism, ignoring all sentiments of patriotism, shutting their eyes to the constitutional foundation stones, the bulwark for the safety of our institutions, "equal rights for all," daring the enforcement of laws which the people believed would be adequate, but which now appear to be inoperative, conspire to victimize the public by floating trust certificates at unhealthy figures, inflation prices, which mean in time a complete collapse.

Commercial travelers, with their hard-headed business sense, would bend to the inevitable should they be driven out of occupation by fair competition. No class better appreciates the significance of the "survival of the fittest;" but to be thrown out of work, to be forced to the wall by a species of speculative conspiracy and the centralization of capital, disproving the oft-made avowals of the capitalist that capital and labor are not antagonistic, and affecting the occupation of thousands previously employed in unusually intelligent labor fails, as a fact, to sit well upon their digestive apparatus.

The only argument in favor of trusts, the one advanced by those directly interested or by their henchmen—and the intention is generally to reduce prices and benefit the consumer—I will attempt to show is fallacious from the evidence of those who have an accurate conception of the true situation, the commercial travelers. I quote the sentiments of one very able traveler: "Trusts are conceived in infamy, born of greed, and cradled in the lap of dishonesty."

RESOLUTIONS OF COMMERCIAL TRAVELERS.

Commercial travelers are against trusts, both on account of self-interest, naturally to be expected under conditions which are an outgrowth of combinations, and on account of the principles involved, the injustice to the people, the menace to democracy, the semblance to plutocracy, and the rottenness of the whole movement.

The following resolutions, placed in my hands, express the sentiments of traveling men generally:

"Resolved, That we deplore the organization of trusts, the illegitimate combination of capital, the curtailment of individual possibilities, as a menace to the prerogatives of the people and a disarrangement of the established methods of business, affecting especially the employment of commercial travelers.

"Resolved, That we condemn as un-American the combination or syndicating of incorporated or individual business concerns for the purpose of controlling products and in restraint of trade and competition."

As a matter of expediency, the resolutions offered at the convention of the delegates of the Travelers' Protective Association, held in Louisville recently, in condemnation of trusts, were laid upon the table, four or five men contending that, being employed by trusts, it would prejudice them with their employers to attend the convention of an insurance association admitting proprietors and buyers, as well as travelers (and a nonpolitical body), should it pass resolutions against trusts. The gentlemen admitted that personally they disapproved of trusts, and it was plainly apparent that the gathering represented an antitrust sentiment; they fully appreciated the fact that none could guess where lightning might strike next. The employed forgot their unemployed brothers in craft and association, the question of expediency was presented, and the resolutions were tabled.

I have heard from several thousand commercial travelers, many replying to a circular letter issued by the Commercial Travelers' National League, asking a number of questions, and the universal opinion is that, as a rule, trusts have advanced wholesale prices and in many instances have fixed retail prices; that some being retained in house positions as a matter of policy, in some cases at former pay, but usually at greatly reduced emolument. As July 1 and January 1 are the usual dates for term contracts with travelers. July 1 will find several thousand more commercial salesmen out of positions.

The traveling men believe that in a few years most of the trusts will have been broken, but that it will be impossible to completely shake off the grasp of some monopolies upon the throats of the people.

My correspondents state that buyers generally do not like the trusts, and would prefer to buy from outsiders, other conditions being equal.

THE NUMBER OF COMMERCIAL TRAVELERS IN THE COUNTRY.

The census of 1890 shows less than 60,000 commercial travelers in the United States. The census is incorrect; probably many commercial salesmen are included under the head of clerks and salesmen. I will not attempt to analyze for reasons, but will try to show why the figures are wrong; and, speaking of statistics, I will ventilate my belief that census figures can be discovered as playing some queer tricks, for many glaring inconsistencies will develop upon research, like the following, clipped from a newspaper annual, and based upon the 1890 census:

"Number of manufacturing establishments reporting, 322,638; officers, firm members, and clerks, 426,099, or one firm member or a president of a stock company and one-third of a bookkeeper to each concern."

The above statement as to the number of manufacturing concerns is in reality a modification of the full number reporting to the Census Bureau, and is modified for comparison with previous reports. Part 1, Manufacturing Industries, census of 1890, page 8, shows 355,415 manufacturing and mechanical industries reporting. Adding to these figures the number of wholesale merchants, importing and commission houses, including the wholesale dealers in wines and liquors, as given by the 1890 census, 81,086, there is a grand total of 386,501 manufacturing and wholesale concerns.

It is easy to conceive that there are 100,000 manufacturers, jobbers, importers, manufacturers' agents, etc., employing 300,000 commercial travelers in the aggregate; and to this number we could add, as travelers for business, the buyers of farm products, insurance agents and adjusters, special auditors in various lines, etc., and our estimate of 350,000 traveling men is found to be a safe and conservative approximation. There were and yet are many houses employing not less than 50 salesmen; some employing more than 200; a large number 25, and several thousand having between 6 and 20.

The Commercial Travelers' Mutual Accident Association of America, with headquarters in Utica, N. Y., admits to membership commercial travelers exclusively, and has more than 20,000 members. The officers of that organization have calculated that one out of every fifteen of the commercial travelers of the United States are members of it.

The last census shows only 9,532 commercial travelers for New York City, hardly one-third of the actual number.

The census of 1890 gives as the number of commercial travelers in the country 28,158, and of 1870, 7,262. In 1870 the hotel keepers numbered 26,394, and in 1880, 32,453. The commercial trade is considered as the most desirable by hotel men generally, the majority of hotels catering to the transient guest; in 1870, however, there were apparently 4 hotel keepers to each traveling man, and in 1880 the hotel keepers still outnumbered the travelers, according to the census exhibit.

From figures supplied me by commercial men I submit the following: That more than 35,000 salesmen have been thrown out of work through the organization of trusts, and about 25,000 reduced in salary, some being retained at a big cut in compensation in house positions, others as traveling agents—60,000 salesmen directly affected by trusts.

EFFECT OF THE ORGANIZATION OF TRUSTS ON COMMERCIAL TRAVELERS.

The estimate by that conservative newspaper, The Springfield (Mass.) Republican, that ultimately two-thirds of the commercial travelers will be thrown out of occupation if the organization of trusts continues ad libitum, and more than 50 per cent if the projected combinations are completed, is entirely reasonable.

I will now consider the effect of 35,000 commercial men out of work and 25,000 at two-thirds their previous salaries, assuming that 12,500 of the 25,000 still act as travelers. One hundred and fourteen millions of dollars represent the annual expenditures cut off by the direct influence of trusts, as follows: Sixty millions loss in salaries; \$27,000,000 for railroad tickets, sleeping cars, and excess baggage, an amount equal to the entire surplus earnings of all the railroads of the country for 1898. The loss to hotels can be safely estimated at \$28,000,000. Should one-half of all the commercial travelers be dispensed with, \$180,000,000 would hardly cover the salary loss annually; over \$75,000,000 would be the loss to railroads, and the same amount for hotels.

The dividends of all the railroads of the United States for 1898 were about \$7,500,000 more than the figures mentioned as the estimated loss to railroads, should one-half the traveling men be dispensed with. The commercial travelers would gradually drift, however, into other pursuits, and although their earning capacity would be greatly diminished, still they would manage to support their families after a fashion, and as disbursing media might represent an annual expenditure, in the aggregate, of between ninety and one hundred millions; but the loss to hotels and railroads would be the figures as given. Every hamlet throughout the land would feel the effect of the loss of revenue to hotels; many hotels would become bankrupt and general distress follow the discontinuance of one-half the commercial travelers as ambassadors of trade.

The history of this country gives examples of poor boys who became great men, beginning at splitting rails, tanning hides, driving canal horses, etc., and we all know personally some illustrations of self-made men; we have listened to the stories of father and grandsire, telling the younger generation of early struggles, and many instances have been cited where a few hundred or a few thousand dollars started them upon a career to fame and fortune. Trusts have come, however, as a curse for this generation and a barrier to individual enterprise.

What will be the prospects for our children? God Almighty alone knows. He who notes the sparrow's fall will remove the dark shadow which the greed of unscrupulous speculators has cast upon the fairest land under the canopy of Heaven. The people cry out for redress; they demand relief from the accursed thing that stalks within their midst, falsely garbed as *industrial scientific economy*. The people demand that lawmakers do their full duty; they must forget self-interest and act as the representatives of the people solely; create State and national laws that will construe the organization of trusts as conspiracies and treat the organizers as criminals. Officials should consistently perform the obligations of office in enforcing the laws already created to meet the exigencies of the situation, and not permit themselves to swerve from duty by the influences often brought into action.

Legitimate corporations should receive ample protection, but the combinations in restraint of trade and free and healthy competition should be considered as illegitimate and as antagonistic to our institutions of freedom and equal rights. To the question, "Have not the capitalists or speculators, if you please, equal privileges with other citizens of this country?" I would reply, emphatically, yes, providing they comply with the laws made for the safety and protection of all the people.

ILLUSTRATIONS OF THE ADVANCE IN PRICE OF TRUST GOODS.

I will cite a few examples of advances in the price of trust goods: Iron pipe, over 100 per cent; tinware and enameled ware, about 33 per cent; brass goods, 60 per cent; chair trust, just formed, will advance prices 30 per cent; United States Rubber Company advanced prices of rubber overshoes 14 per cent on May 1; American Tin Plate Company advanced prices something like 30 per cent; news paper, one-quarter to one-half cent a pound, a further advance in prospect; book paper, 5 to 10 per cent; an advance is expected in writing paper; in common soap, 25 cents to 50 cents a box; flint-glass bottles will be advanced 10 per cent or more; jobbers and manufacturers of clocks have advanced the wholesale prices on account of the advance of metals, 60 per cent; all metal goods have been advanced; brass pins, 25 per cent; pipes and brushes, 12½ per cent; combs, 7½ per cent; ribbons, 10 per cent; school furniture has gone up, as well as paper bags and wrapping paper.

The window-glass trust, organized May 29, with \$30,000,000 capitalization, will advance prices 100 per cent.

The umbrella trust failed four years ago; it advanced the prices while in existence, and after its breakup the return to legitimate and healthy prices caused a loss to the retailer, through the stock on hand.

There have been advances in many other lines. The object of trust promoters and organizers is to make as much money as possible through stock manipulation, and to show industrials as attractive investment securities, no matter at what cost and without consideration of the distress which increased prices cause consumers of limited income. So advanced prices are in order, or in prospect, in the trust lines. As trust capitalization represents over 50 per cent water, it is necessary to advance prices to show a profit upon the fictitious values.

The exceptions cited of reduced figures to the consumer, for sugar, coffee, and kerosene oil require but few comments from me. The fight between the Havemeyers and the Woolson Spice Company upon one side and the Arbuckles upon

the other, and the result upon the price of refined sugar and coffee, is too well known for me to discuss. The spectacle of a trust trying to drive out a monopoly by the retaliation of a sharp competition, and ultimately selling at less than cost in seeking to attain its object, is one of the peculiar situations engendered through the speculative mania that is epidemic. The sugar trust paid, in 1893, 21 per cent and, from 1894 to 1899, 12 per cent in annual dividends upon common stock and 7 per cent annually upon preferred stock, in spite of the low prices so much commented upon by the advocates of trusts. Beet sugar pays a gross profit of \$6 a ton, the beets costing \$4 and the sugar selling for \$10 a ton.

Regarding kerosene oil, the by-products in the refining of petroleum are the most valuable and render enormous profits to the Standard Oil Company. As you know, kerosene is an unavoidable constituent in coal-oil distillation; and with a limited market, owing to the increase in the electric lighting, the cheapening of gas, etc., it is sold at the best price possible to market the product. Improved processes of manufacture and the methods of handling and transporting have assisted in reducing its cost.

TREATMENT OF COMMERCIAL SALESMEN BY TRUSTS.

I will note a few examples of the way in which the commercial travelers have been treated by trade combinations: The National Enameling and Stamping Company, which depends for its raw material upon the American Tin Plate Company, has thrown a great many out of employment, and those retained have had their salaries reduced. The great tobacco combine threw out about 3,000 salesmen; the Continental Tobacco Company telegraphed the discharge of 350 in one day; the Baking Powder Company Trust¹ has dispensed with all excepting half a dozen men. I know of two salesmen discharged by the trust who were formerly in the employ of the Cleveland Baking Powder Company, one receiving a salary of \$5,000 a year the other \$4,500. Their routes, with those of other discharged salesmen, are covered by one agent at \$18 a week. The bicycle trust will throw out 600 salesmen gradually and will cut down agencies in every city. The chair trust will affect immediately more than 500 salesmen by cutting them out of the line.

One man writes: "The Union Bag and Paper Company has thrown out of employment hundreds of salesmen." Another, writing of the same trust, states: "I lost a good position. They (Union Bag and Paper Company) would like to kill all outside manufacturers, and are trying to do so by sharp competition."

The number of salesmen out of work because of the United States Rubber Company is 300. The salesmen retained have been reduced to a salary, averaging, so I am informed, \$1,300 a year. The American Tin Plate Company cut off about 90 out of every 100 salesmen. The American Steel and Rod Company, I have been told, discharged 300 commercial travelers in 1 day.

In giving these estimates I am not considering the office force thrown out through trusts. I was not invited to speak in their behalf, but I will call your attention to the fact that the American Tobacco Company discharged its office help in St. Louis at the time of removing the headquarters to New York. I know of 2 head clerks in different establishments who were discharged by concerns absorbed by the trusts after nearly 25 years' service, and hundreds of like instances can be discovered upon investigation. The sugar and coffee monopolies have thrown out 1,000 salesmen; the average reduction in salary of those retained is \$1,000 a year, 25 per cent only of the old force being retained in house positions. The Standard Oil Company employs fewer salesmen than any other concern in the mercantile world of one-half its capital and profits. It has reduced the salaries of the salesmen in its employ, with only a very few exceptions, to less than the income of the average mechanic.

The leather trust has affected nearly 25 per cent of the salesmen; the electric carriage trust has compelled several men to seek work elsewhere. The thread trust has dispensed with a number of men, and is getting rid of the remaining travelers by degrees by paying reduced salaries and dropping hints that it would be advisable for the salesmen to seek other occupations. The type-founders' trust

¹ Information regarding the Baking Powder Trust was furnished by one of the commercial travelers discharged after the combination, who said: "All go but six." He has explained since my appearance before the Industrial Commission that he meant all would go but six. On June 17 I learned that out of 140 salesmen employed by the houses absorbed in the combine, 96 had been discharged, and many more would be dispensed with.

has affected 40 men. And so on, up and down the list. The examples mentioned will serve as illustrations of the whole.

One comment more and I will close: I find that the banks are refusing to grant loans upon trust certificates as collateral, with only a very few exceptions, showing a lack of confidence in the stability of speculative prices, and doubts as to the integrity of trust stocks.

I will now try to answer such questions as are within my power.

SOURCES OF WITNESS'S INFORMATION.

Q. You have given us a good many figures along different lines. Let us consider, to begin with, the statement that you had heard from several thousand traveling men. Can you make that a little more definite? About how many thousand have you heard from?—A. For the last 6 months I have been holding conferences at various hotels in different parts of the country. I have invited traveling men, sometimes 5, 10, 20, 50, to my room. We discussed the subject of trusts. Regarding one conference held in Elmira, the papers stated that it was an organization to combat the trusts, that it was organized for the purpose of fighting them. I asked for a correction, and the local papers then mentioned the matter as a conference; when we were placed in a false light, we asked for a correction. For the purpose of securing a general expression of opinion, the national league sent out the following circular letter:

OFFICE OF P. E. DOWE,
BEDFORD PARK, NEW YORK,
May 17, 1899.

MY DEAR SIR: I have been summoned, as president of the Commercial Travelers' National League, to appear before the Industrial Commission in Washington between June 7 and 17, to give evidence regarding the effect of trusts and monopolies upon commercial travelers and commercial traveling. As I desire to have a general expression of opinions, and to be in a position to submit the ideas of the majority, rather than to advance my personal sentiments, I ask that you write me at the above address at once, answering the following questions by numbers, and giving such personal opinion as you think covers the situation. Your communication will be regarded as strictly confidential, and is intended for my personal assistance only. You have my assurance that any inside information you may give will not prejudice you nor your business connection.

1. What is your line?
2. Is there a trust now in existence in your line?
3. If so, what is its title?
4. Has it exerted any influence toward advancing or decreasing wholesale prices?
5. What effect has it upon retail prices?
6. Does it compel fixed retail prices?
7. What effect has it upon commercial travelers and commercial traveling?
8. Approximate the number of men out of work on account of it.
9. Approximate the average reduction of salary of those retained.
10. If possible, give approximately the proportion now retained in house positions.
11. How do trusts, combinations, and monopolies affect you personally?
12. Do they affect your sales?
13. Is the concern you are agent for in a trust or syndicate?
14. What is your opinion regarding trusts and combinations?
15. What is the opinion of commercial travelers generally regarding trusts, combinations, syndicates, and monopolies?
16. What is the opinion generally of the buyers you come in contact with, as to the same?

An immediate reply will greatly oblige.

Yours, fraternally,

P. E. DOWE,
President Commercial Travelers' National League.

Q. In response to that general circular letter, how many answers did you receive?—A. I can not give you more than an approximation of that; there are other ways in which I have secured information. Certain members of the league have acted as agents for me, and on account of my acquaintance with the newspaper men, a number of them, I may safely say running into hundreds, published a card asking that information be sent me, and I have been in receipt of letters at my home, at the post-office box of the league, at the headquarters of the asso-

ciation on Seventeenth street, New York, and in various ways. The aggregate is close to 6,000.

Q. Six thousand you have heard from?—A. Six thousand I have heard from in the different ways.

Q. Partly by circular letter and partly by meeting them in person in these conferences?—A. And through agents acting for me in reporting. There were 4,000 of these circulars sent out, and I was surprised at the number of returns, when, taking into consideration that it is customary for good business men not to put in writing anything that might be used against them.

Q. You infer from that that the feeling is very strong?—A. Very strong; they are almost a unit. Of the 6,000 I have heard from in various ways only 2 were in favor of trusts. One of these men neglected to sign his name to the communication, and the other gentleman is an employer and not a commercial traveler. He has been an officer of a commercial travelers' association, is a well-known politician in New York State, and is interested in the bituminous coal industry as a wholesaler. Those are the only two I know of favorable to trusts.

COMMERCIAL TRAVELERS' ASSOCIATIONS—THEIR CHARACTER AND OBJECTS.

Q. Will you be kind enough to give us some details with reference to your organization, the Commercial Travelers' League, as to what it is, what its purpose is, how organized, its membership, and so on, so that we may see what its principles and purposes are?—A. The Commercial Travelers' League was organized nearly three years ago for the purpose of doing more aggressive work than was advisable for the commercial travelers' insurance associations to undertake or for their social bodies to enter into. The object of the association was to combine the officials of the various commercial travelers' associations and the more aggressive, more positive commercial travelers of the country—those ready at all times, upon occasion, to put their shoulders to the wheel. It stands on record as having accomplished everything attempted, as having been a winner in everything undertaken.

Q. What is your membership?—A. The membership, I think, is a little less than 2,000. I have not seen the books; I have been away two months, and I can not give you the exact number. It is over 1,500—somewhere between 1,500 and 2,000.

Q. From what you say, I judge that it is your own opinion that the nature of the membership is such that it is more effective than others of much larger membership.—A. For that reason in nearly every undertaking it has been backed up morally by other associations in the country with the exception of 2. I once had the honor to represent the commercial travelers here in Washington before the Senate and House Committee on Commerce. I had credentials showing I had authority to represent 40,000 traveling men. The other associations gave me authority to speak for them—the Utica association, with 20,000 members, the Toledo association, the Springfield association, the Albany association, and a number of travelers' associations throughout the country. The list is too long to go through, but it gave me authority to represent 40,000 traveling men in organization. The two associations that were exceptions, were the association of which the gentleman of whom I have spoken as a politician, was an officer, and the Travelers' Protective Association, which preferred to fight on its own lines.

Q. You spoke a moment ago in reference to this organization expecting to take up other lines of work, in insurance, etc. Do I understand you to imply in that assertion that most traveling men's associations have insurance as one of their chief purposes?—A. Yes; either that or sociability.

Q. And it is said to have more positive influence on legislation than associations of that kind?—A. Yes.

OVERCAPITALIZATION OF INDUSTRIAL COMBINATIONS.

Q. I believe you made the statement that the stock of the industrial combinations was over 50 per cent water?—A. Yes.

Q. May I ask if you have made any careful study along that line, by taking up a good many organizations and finding what the values of their plants were?—A. I make the statement on the evidence of those I have come in contact with, those who have supplied me the information. I am merely asserting this from the information I have received from those identified with the different lines. Now, as an illustration, Leggett & Myers, I understand, were paid in cash twice the value of their plant. That comes from tobacco men, and, of course, I make the statement for what it is worth.

Q. You say they were paid in cash twice the value of the plant, the value being estimated, of course, by the man from whom you got the statement?—A. Yes.

Q. Can you think of any other specific instances that would perhaps give even higher rates paid for plants than that, part of the pay being made in stocks and bonds?—A. Only in a general way. I think the census of 1890 shows something like six billions of dollars invested in all the manufacturing and mechanical industries of the country. It has been estimated by one of the journals on economics that five billions of dollars represented the capitalization of the trusts.

Q. So that it was partly on these figures and partly—A. On the information I have received.

Q. On information you have received directly that you make the statement about capitalization?—A. Yes.

Q. The same thing applies with reference to the prices you have cited?—A. Yes. The traveling men have the prices, they know the prices absolutely.

Q. And when you get information from one that prices have gone up 50 per cent or 100 per cent, he is speaking on positive knowledge?—A. Of the goods he is selling or has sold.

METHOD OF DETERMINING THE LOSSES OF TRAVELING MEN.

Q. You have also given us figures with reference to the losses that have taken place in salaries on account of the formation of these combinations, loss in transportation and baggage, loss to hotels, etc?—A. Yes.

Q. Will you speak with some definiteness with reference to the way in which you figure out the losses; what is the basis of your figures?—A. My first effort was to get an approximate idea of the number of men who were affected by the trusts; having arrived at that, I figured on the basis of an average of \$2.50 a day for railroad expenses, 240 days of the year, which is a very safe approximation. The result is \$600 a year.

Q. You simply took a number of good concerns, and took a basis of \$600 a year loss for each traveler thrown out?—A. Yes.

Q. And with reference to the losses of hotels, and losses in transportation and baggage?—A. On the same basis. The loss to hotels equals if it does not exceed the loss to railroads.

Q. Taking the same number of men, and finding what the average is from this, the amount they are charged for excess baggage, etc., from your own experience and that of others whom you know?—A. Yes; on the salary basis I have calculated on \$1,200 a year.

Q. That, perhaps, is sufficient as regards the question of facts. You said that when one organization was formed a large number of men were thrown out of employment in St. Louis, possibly being transferred to New York?—A. Yes.

Q. When you make a statement of that kind, and speak of the men being thrown out of employment, do you take into account that perhaps new men are brought into employment in New York, when the office is transferred there?—A. That is doubtless the fact, but in much smaller numbers. I make that statement on the assertion of a man who is an expert in the tobacco business, a man who has received \$8,000 a year from one of the companies that was absorbed by the trust. A man who is capable of earning \$8,000 a year as a salesman must be a man of ability.

Q. In your estimate have you taken into account this—that probably some would be given work where others were thrown out? In making these statements as to the number of men thrown out of employment, have you deducted from the totals the number of men you thought would be brought into employment by the trust, or did you not think there would be any?—A. Of course there are a number retained. I figured on the basis of 35,000 that were thrown out absolutely, and 25,000 reduced in salary. Some were retained in inside positions, and some are still traveling at reduced salaries. Reductions have been effected all along the line, with few exceptions.

Q. Have you any information that tends to show that certain men, perhaps the more skillful and more capable, have received increases in salary?—A. No; the tendency has been to reduce them and dispense with the high-priced men. To-day if the line is in a syndicate any man can sell goods, for he can call with the list of goods and ask the dealers to fill out what they want. We will cite, for instance, the baking-powder trust. That includes the Cleveland, the Royal, the Price baking powder, and one of the cream of tartar baking powder companies. The men travel for \$18 a week, replacing men who received four or five thousand. They go around with a list and say, "How many do you want of Price's, how

many of Royal, and how many of Cleveland?" It does not require a salesman after trusts are organized; dummies will do.

Q. Have you any evidence to the effect that some of the traveling men were put into the office force at increased salaries?—A. No; I do not know anything of the kind. They may have been temporarily as a matter of policy, but it was purely policy. They may be afraid of some. There are instances where they may be afraid of the ability of some men in certain trusts. I have cited the American Thread Company as retaining men at reduced salaries, but dropping hints daily that it would be advisable to seek employment elsewhere. They advise them and assist the competent, hoping the men will get positions in other lines. Some of the other trusts have not been as generous.

THE SAVINGS RESULTING FROM TRUST ORGANIZATIONS.

Q. The statement has been made here and is frequently made by members of the organizations that great savings are made in the cost of production by dispensing with the services of middlemen, as they call them, including traveling salesmen and the wholesale dealers in many cases where they can sell directly to the retailers. Would you think there is anything wrong in that general statement, as a principle? Is it not true as a matter of fact that they do make a great saving in the cost of production?—A. Yes; they make a saving in the cost of placing particular goods, certainly.

Q. When I use the word "production" I use it with reference to getting goods into the hands of the consumer.—A. Certainly. From a basis of economy there might be something in it, but at the same time they advance prices; and the theory that the benefit would accrue to the consumers is fallacious.

Q. But suppose that they make a statement that there has been a great saving, which you yourself concede as possible, and that the prices have not gone up but have remained the same, would you say it was a benefit or evil to the people as a whole?—A. From the very basis of trusts I would consider it an evil, a decided evil, because it would not only affect the commercial travelers but others as well. I appreciate the fact that there have been advances made in the wages paid the laborers in manufacturing industries in various lines. I do not think these advances were given from the generosity of trust organizations or trust officers, but I believe they were made as a matter of policy.

Q. Explain.—A. For the fear of consequences I do not care to be very explicit in regard to the situation, but I will say that there is a general sentiment among the people of the country against trusts, against monopolies, against the un-Americanism of them; and I have letters from men of intelligence who intimate that it is driving tens of thousands into socialistic ideas. This is my personal opinion. I am not offering it as the sentiment of traveling men; I am offering it as my personal opinion, that the advances they pay labor is from fear of consequences.

Q. Do you think this throwing of the commercial travelers and others out of employment is likely to be more than a temporary matter? If this trust organization goes on will it not result, in the course of time, in these men finding employment elsewhere, perhaps some of them at lower wages? Is it, on the whole, likely to result in the permanent throwing out of a large number of men?—A. Well, it will throw out permanently some of them who are old, who have been in their special lines so long that they know only those lines; it would be difficult for them to adapt themselves to others. You take a man who has been in the nail business, and he knows nails, or a man in the rubber business, and he knows rubber; if these men try to seek positions with a dry-goods house the first question asked is, "Where have you sold goods? Have you made sales in dry goods?" and unless the man is acquainted with dry goods he is not wanted. To-day the merchants, jobbers, and manufacturers want the very best men, the most experienced men that they can get.

Q. At the present time, in discussing this general question, the trust managers themselves compare their form of organization to the invention of a new machine. They say that when the steam engine was introduced, for example, or when the railroads were introduced, a great many men were thrown out of employment and there was a great deal of suffering consequent upon these inventions, but in the long run they think that these inventions have so cheapened the cost of production that the general comfort of the community has been very greatly raised. Now, the trust men declare that, in their opinion, a trust organization is a somewhat similar means of saving labor and lessening the cost of production, so that while they grant the existence of these temporary evils, they believe that in the long run these organizations will be a benefit to the people of the whole country, and that their benefit may be comparable with the benefit to civilization of the

railroads. What would be your answer to that general argument? I have tried to represent them fairly.—A. Personally I consider that trusts are the worst, the greatest, evil that has ever confronted the American people. The opportunities for a poor man to advance no longer exist. Many of these very men, who are the backbone of the trusts, started with next to nothing, and they certainly should allow others the same opportunity and the same advantages. The standard of labor in England is one which prevents the poor man, the laborer, and the intelligent workman also from getting ahead; wealth is against them. In this country we have had an equal chance, and ability counts; and if we are approaching a time when trusts and centralization and economic principles, if you please, apply to all lines, it is going to work evil for the intelligent laborer of this country. What chances will the middleman, what chances will the salesman, what chances will the intelligent laborer, have? None whatever.

Q. Then, your reply to that general argument of the trusts is substantially this: You grant there may be a money saving, but it is at the expense of the intellect, strength, and moral character of the great mass of the working people?—A. Yes.

Q. That it tends to degrade the general level of labor?—A. Yes.

Q. Although you would grant the economic saving?—A. Yes.

THE EVILS RESULTING FROM TRUST ORGANIZATIONS.

Q. (By Representative BELL.) I should like to ask a question or two. As I understand, your objection to trusts is based upon the principle that it narrows the field of labor?—A. Yes.

Q. And that they monopolize not for the benefit primarily of the public at large, but for the monopoly itself?—A. Exactly.

Q. Now, when you throw out of employment the many thousands of persons, and allow those monopolies the production and control of the necessities of life, as I understand you, your men say it has a tendency to breed socialism in the United States?—A. Yes.

Q. Is it not a fact that to-day the general masses of the people believe that if the railroads and all of the other great natural monopolies can not be run for the benefit of the mass of the people the public should own them? Is not that the tendency?—A. I can speak for those I have come in contact with outside of traveling men. I have not discussed that question with traveling men, but I find in certain sections of the country quite a sentiment in favor of Government ownership of railroads. It is talked of, but how deep it is I can not tell you; I have frequently heard remarks on that subject.

Q. Now, as I understand, you say in your experience as a salesman that when the tin-plate trust was formed the price of tin plate went up immediately?—A. Yes.

Q. The only time it lowers the price is when the monopoly is trying to destroy all opposition?—A. Yes.

Q. Did the price of copper go up immediately after the formation of the trust?—A. Yes; the advance to date is sixty per cent.

Q. Did not the price on all iron, steel, wire, nails, and everything go up immediately after the recent trusts?—A. Yes.

Q. Then it does not have a tendency to lower prices? It would lower the cost of production, which it evidently does?—A. Yes.

Q. But at the same time it does not lower the price to the consumer; the object is to raise the price to the consumer?—A. Yes.

Q. That is your general understanding of it?—A. That is it.

GOOD PUBLIC POLICY OPPOSED TO CONTROL BY MONOPOLY.

Q. And your idea is that the public policy forbids control by any monopoly in a free country, even though it might redound to lowering the prices?—A. Yes.

Q. You would say that, to the public at large, the individualism of the citizen and the right to fair competition, and to the general employer, is worth much more than is the lowering of the price when so many of them will be deprived of the opportunity of buying goods at any price?—A. If it had that effect.

Q. Do you think it would have that effect?—A. By lowering the price?

Q. Well, for instance, they might lower the price because there is an economy in production; the question is, whether public policy will permit combining at all of that kind?—A. No.

Q. Do you believe that, as a matter of public policy, low prices or lower prices are beneficial generally? That is the argument, I understand, that all attempt to make.—A. Trusts have advanced prices, not reduced prices.

Q. They claim here before us that the syndicating of all these lines of products inures to the benefit of the consumer.—A. They say so, but I fail to find where it is.

Q. They are trying to drive out competition?—A. Yes.

Q. When they are masters of the situation will they put prices back to make a reasonable profit?—A. More than a reasonable profit when they advance the cost in some lines 100 per cent.

Q. As I understand you, practically in everything, where they are not having severe competition in the numerous trusts formed this year, the price has invariably gone up?—A. Yes; excepting in those instances where there have been reasons or methods for crushing out opposition.

Q. I say except where that is going on to-day?—A. Yes.

Q. Now, have you found this in your experience, that where the lines of production all go into a trust they select the point where they will do their chief producing and force the laborers to yield to the demands of the employer, by virtue of their power to shut down the works in one place or another without injuring the owners of the works or the trust?—A. Well, that is certainly a possibility, I have no—

Q. (Interrupting.) It is perfectly feasible, you think?—A. Yes.

Q. For them to shut down?—A. Yes.

Q. And if a man does not abide by the dictates of the employers at one place they can shut down and injure the men and community without injuring themselves. Do you not think that this is sufficient within itself to cause the legislative powers of the Government to prohibit such power being put into the hands of any portion of the people?—A. Yes. In line with that argument the American Linseed Oil Company has 35 linseed-oil mills. It would be easy enough for them to manufacture in 34, if they desired to shut down 1.

Q. If they were threatened with trouble at one place it would be the most natural thing in the world to immediately shut that down so as to make the employees submit, and they have power to do it?—A. Yes. The American Tin Plate Company controls over 240; the Federal Steel Company controls enough establishments to fill a space of several inches in the newspaper columns.

REMEDIES FOR THE EVILS OF COMBINATION.

Q. (By Senator MALLORY.) You have given this subject, so far as it affects the interests of your association, considerable thought. Have you given any consideration to the question of the remedy for this existing or anticipated evil?—A. Well, that is the hardest question to settle. We can analyze the situation and appreciate the evils, but the remedy is for the most wise lawmakers themselves to discuss.

Q. Have you thought of any? There have been certain suggestions made as to different methods of treatment, legislative or otherwise. Has any suggestion of that kind commended itself to you as feasible?—A. Well, the majority of traveling men who have communicated with me, although they have been united in regard to redress, saying that trusts must be done away with, and the conditions must be remedied, and all that; only a few have suggested remedies; one man wrote me in regard to the law of the Swiss Republic, which has existed for 400 years, and gives the people the right to withhold charters from trusts or trade combinations in restriction of trade.

Q. (By Mr. JENKS.) May I ask if that means this—that in case any combination asks for a charter, the question has to be referred to the people to vote upon?—A. You have made a special study of this question.

Q. I do not know what special law was referred to; that is why I asked the question.—A. I will see if I can find that card; I think the gentleman made reference to the law, which has been in operation in the Swiss Republic for 400 years; that is a Republic of 400 years' standing. I think he refers to the referendum law.

Q. (By Senator MALLORY.) That would involve, of course, an entire change in the corporation laws of the United States and every State. Another method has been suggested, or a statement at least of another method has been made by somebody, both in the newspapers and here, viz, that of cutting down the tariff, of authorizing the President to do so, as in cases of reciprocity. Our Supreme Court has held that it is constitutional for the President, under the direction of Congress and under certain circumstances, to remit certain tariffs; and, in the event that these combinations become oppressive, it is also proposed that the President be authorized to remit the tariff on the articles covered by a combine if it becomes oppressive. That has been suggested; there are others.

I did not know but that you had something to say on that.—A. The traveling men are not students of legislative affairs. They have a thorough conception of what is good as affects business and are very good judges of political conditions and political situations, but this is a subject that the best lawyers have spent much thought upon, and it may be a little too deep for business men.

Q. It is a subject that this commission is very deeply interested in. The commission is desirous of getting all the assistance it can. I do not think it is one that is purely legal; it is one upon which we ought to have the best talent of all the business interests of the country.—A. In trying to answer your question I will submit a couple of letters; possibly it will be advisable for me to omit the names. In answer to question 14 [reading]: "The trust will cause in the near future the greatest disruption ever seen in our country; it is making extreme rich and extreme poor. The bone and sinew of our great country, the middle class, is fast disappearing. Owing to the close competition, the mechanic can not go into manufacturing on his own account with a small capital, as he could. It is not conducted with the same capital as of old. That condition, we contend, is deplorable. Many of our rich men to-day would not have succeeded had they to contend with the present condition." He winds up [reading]: "The political party that will dissolve trusts gets my best efforts and vote." He has always been an advocate of a certain party.

Q. The great difficulty is how to do it, so far as the Federal Government is concerned. How can the Federal Government reach them?—A. Here is a letter from a very intelligent man. I will omit the information in regard to the proposed trust in his business because they have not succeeded in obtaining it yet; it is spoken of as one of the prospective trusts (reading): "It is my opinion, and it is shared in largely by men with whom I come in contact in all kinds of business, that the day is near at hand when the disastrous result of the trusts will be felt everywhere. Another effect that the trusts are having is in making thousands and tens of thousands of socialists, and the time will come in the near future when all classes of business men, laborers, and mechanics, regardless of former party affiliations, will vote with the party that is against them. While I have no sympathy with socialism, believing their principles to be all wrong, I recognize their rapid increase, and if our lawmakers are wise, it is my opinion that they will stop the formation of more trusts and in some way do away with those already formed." That is the opinion of an old traveler, a very intelligent man. But the remedy—I would hesitate to suggest anything for fear it would not be the right one.

Q. Well, we have the Interstate Commerce Commission which has supervision over railroads. The only reason that Congress could establish the Interstate Commerce Commission, with the power it was intended to give it, is the fact that the railroad corporations are public corporations intended for the public weal and the public benefit. That is the only basis on which Congress could interfere. That does not exist in the case of the corporations we are considering here, private corporations.—A. It seems to me that they can only be affected by conspiracy laws and by restricting corporate powers. It is a subject I do not care to get into a discussion on.

Q. (By Senator MALLORY.) I have only troubled you because I thought it might have occurred to you to suggest something.—A. If I had been under the impression that I was to be asked that question, I should have—I came here to give facts and figures as a business man—I should have consulted some of my friends among the lawyers, and possibly should have gleaned some information from the aggregate result of their opinions and might have submitted that; but I should have hesitated even in that case, because of the importance of the question and the importance of the situation. People ask for redress, and the lawmakers will have to discover some way of giving it.

Q. (By Mr. PHILLIPS.) Have you expressed definitely the reason why so large a number of the traveling salesmen have lost their employment? What is the reason for these conditions under trusts that did not exist before?—A. The simple reason is that with competition salesmen are necessary for every house in their line; with the syndicating—with the combination—salesmen are no longer a necessity. An agent—a bookkeeper—could be sent out by the trust to collect orders, or the business could be done by mail. If it is a commodity that is a necessity, and that commodity is in the hands of one syndicate—one trust—the dealers have got to buy from that trust.

Q. (By Representative BELL.) And the trust gets a higher price for the article even after disposing of all this help?—A. Yes.

Q. And the public is injured and not benefited?—A. Yes; that is right.

THE SAVING BY COMBINATION RESUMED.

Q. (By Mr. PHILLIPS.) If the chair understood you correctly, you said that trusts really cheapened things; that manufacturing is cheaper than without trusts. Do you limit that to a large number, under one control, in various parts of the country that have gone into a combine or trust? Do you believe, in other words, that one central organization can run 40 different manufacturing establishments in 10 or 15 States as cheaply as the owners could in each of those States, provided their works were large enough to manufacture a reasonable amount of goods?—A. Why, certainly, they can produce for less money with the syndicate, by cutting off expenses; first, the salaries of traveling men, and, second, the salaries of officials. For instance, Jones, Brown & Robinson is a concern that will sell out to the American Windbag Company, and the American Windbag Company will ultimately sell out to the American Wind Syndicate, and so on; it is a wheel within a wheel. Some salesmen were disposed of by Jones, Brown & Robinson, and then there were some salesmen who represented the American Windbag Company who were dispensed with when the company went into the American Wind Syndicate. At the same time there was a dropping of officials, of Jones, Brown, and Robinson. They received a big price for their plant; probably two or three times what it was worth. It may be possible that Jones was president of the American Windbag Company or a director when they sold out to the American Wind Syndicate. Certainly it reduces expenses.

Q. There are certain industries not subject to the expenses of traveling salesmen that perhaps could not be run as cheaply as by individuals who look specifically after their own plants. I have heard it stated that the largest trust in the country is not producing as cheaply as those of much smaller capacity can produce. Their whole plants are run by employees. Their production and their manufacturing is all run from one central office, and all who manage these head affairs are employees?—A. I can understand very readily how a trust would pay a less profit than individual concerns, on the ground that much of the capital is water. If I had a plant, a business which was worth intrinsically \$100,000, and an agent of the trust would come to me and say, "Mr. Dowe, we will give you \$200,000 for your plant; we will give you \$100,000 in common stock and \$100,000 in preferred stock," and if I thought I was strong enough to buck against the trust, I would decline. They may finally think that I am a pretty good judge of my business; that I will be quite a factor in competition, and will interfere with the immediate advance of prices, and they will agree finally to give me \$200,000 in cash. Now, I have made, besides the salary of those who are identified with me in this \$100,000 plant that they bought for \$200,000, a profit on \$100,000 of 10 per cent; they will expect to make 10 per cent on \$200,000 and somebody will be defrauded. But I can readily understand how it would be difficult unless the prices were advanced to make 10 per cent on \$200,000 where we used to make it on \$100,000.

CAN TRUSTS SURVIVE FOR ANY LENGTH OF TIME?

Q. Do you believe any trust could exist for any length of time provided other people could organize and pursue the same line of industry on the same terms and conditions of transportation?—A. No, it would assist in breaking them up very rapidly. The salesmen would be willing to go into the business, if they had the capital back of them, and they certainly would have a knowledge of the business. Since I made a personal argument previously, I will make one again. I sell printing presses. Suppose the manufacturers of printing presses should go into a combination and should say, "Mr. Dowe, you know the technical points of the business, but we can not pay you \$5,000 a year; we will give you \$2,500 and a house position." Well, I might be egotistical enough to believe that I could organize a company of my own, and I would get some friends to put up money and would go to New Jersey and capitalize a million dollar company with about \$30,000 to begin with and ultimately sell some stock. Of course, my friends and others interested with me would approach other friends. The representatives, the agents of the printing-press syndicate, would receive instructions to undersell me under all circumstances. No matter what price I might make they would be told to go under it, and I would soon be wiped out of existence.

Q. If there was a law to prevent your company from underselling at any given point where you had a market for your goods, and keeping the price up at other points; if there was a law to prevent that—to prevent what might be called destructive competition—would anyone be willing to take your stock if they could get in on terms of equality? That is the proposition.—A. Yes; that is a pretty

hard proposition. I appreciate the fact that some of these officers that are thrown out—that have sold out their interest in the concern absorbed by the trust—will remain idle a certain length of time, but some of them will be energetic and progressive, and will be factors in competition with some of the very trusts they sell out to. I appreciate that, but whether they can be on a basis of equality or not, that is a question.

Q. The opinion very largely prevails among business men that the trusts will go down of their own weight; that they can not be managed as economically as smaller companies can manage their own affairs.—A. It is the belief of the traveling men that trusts are largely water and are organized primarily for speculative purposes, and that they will go down on that ground. If they were handled as honestly and economically as ordinary businesses can be handled by the owners they would last many years.

Q. (By Representative BELL.) Has not the Standard Oil Trust lasted now for over thirty years?—A. The Standard Oil Company and the South Improvement Company.

Q. (By Mr. PHILLIPS.) Do you believe that the Standard Oil Company is producing oil as cheaply, refining oil as cheaply, and marketing it as cheaply as others could do and would do if they had the same opportunity?—A. If they had the same opportunity others could produce as cheaply, but the Standard controls such a large proportion of the product that they virtually make the price for crude oil.

ATTEMPTS TO INFLUENCE WITNESS.

Q. (By Mr. KENNEDY.) Has anyone sought to influence you in regard to the testimony you might give before this commission—made any sort of threats?—A. Well, you might call them implied. It was said to me that it is dangerous for a man who depends upon selling goods for a living to take the stand that I have. I met a gentleman in New York, a lawyer, who intimated that it would be dangerous; it may have been his personal opinion and it may have been from higher authority.

Q. Has he any connection with the trusts or combinations?—A. Well, not directly.

Q. Indirectly?—A. He may have, possibly.

Q. Is he attorney for any of them?—A. No, the man is an assistant in the office of a lawyer who has had some interest in trusts, but I would not want to say that his opinion is any other than his own, that it would be dangerous for a man of no greater influence than myself to assume to oppose these gigantic affairs.

Q. Did he think that you might be crushed?—A. Yes, he said I could be crushed as easily as a caterpillar.

Q. (By Senator MALLORY.) Do you understand that by authority?—A. No; the young man stated that I might be crushed out. It was the opinion of the gentleman that I might want to find work in some other line than the printing press, and if I sought it of a trust I would more than likely be turned down.

Q. (By Mr. PHILLIPS.) The printing-press firm for which you work is not in a combine or a trust?—A. No, there is no trust in the printing-press line. There is a trust among the typefounders, the American Typefounders' Company, and the Continental Paper Company, and others. There is a trust about to be organized on writing paper, and a letter I received to-day from a gentleman who is well known as a printing-ink salesman says: "As yet they have been unable to form a trust in my business. It is the most peculiar business ever known, I think, and I do not think they will unite, for they have been making frantic efforts of late to do so. As you probably are aware, I sympathize deeply with those poor fellows who have got the wrong end of the stick."

Q. (By Representative BELL.) What effect did this trust have on paper?—A. They advanced prices from one-quarter to one-half cent a pound for newspaper, with the excuse that the war news demanded an increased quantity, but they continue to charge the advanced price.

Q. They keep up the price?—A. Yes; they have not reduced the price, and now the excuse is that they cannot pay dividends at the old price; but the first excuse was that it was owing to the quantity used for the war news.

Q. (By Mr. CONGER.) Are you acquainted with the fact that the price of newspaper is the same now as it was a year ago when the war was on?—A. Yes, it is the advanced price; the price advanced owing to the war as they explained it.

Q. The price advanced in the early part of last year, 1898, and has not gone back?—A. No; where paper was sold in carload lots, the price was 1½ of a cent. The price is now 2½ to 2½ and sometimes a fraction over.

DISCUSSION OF TRUSTS AT THE CONVENTION OF THE TRAVELERS PROTECTIVE ASSOCIATION.

Q. (By Mr. RATCHFORD.) In your paper you referred to the action of the Louisville convention on a resolution which was introduced, and justified the action of the convention in tabling it upon the ground that certain members were in the employ of trusts. Is that correct?—A. Yes.

Q. Are you aware that the newspapers of the country state that the commercial travelers at their national convention voted down a resolution against the trusts?—A. I am sorry such a statement was published, but that was an error.

Q. Was it contradicted?—It was not contradicted; it was allowed to pass. It is very difficult to get a correction after a story goes broadcast through the country. The papers will state it as an item of news, but will correct it, if insisted upon, in very small form; there were headlines given to that report in all the newspapers in favor of the trusts. It was given as a news item with the expressed surprise of moderate newspaper men that such should have been the case. I was a delegate to that convention, but I was late arriving there. I started from New Orleans to attend the convention and I missed connections twice. I got there the last day. I was given the privilege of the floor, and asked the commercial travelers' delegates to send to me all the information they could collect. After having asked for that information, the subject of the resolution came up; I was placed in a position where I had to keep my mouth shut, and take no sides, but after the convention a number of our delegates met in room No. 240 of the Louisville Hotel, and condemned the action of the body in tabling that resolution as a cowardly act.

Q. How many delegates were there in that convention?—A. I believe it is claimed there were 300.

Q. Who were the delegates employed by the trusts who favored the tabling of that resolution?—A. They were principally men from Illinois, and numbered about 5 or 6.

Q. Five or 6?—A. And some of them were employers, by the way, and not commercial travelers.

Q. Can you state whether or not there was any other influence that operated in the tabling of that resolution?—A. Nothing, except there were two resolutions, one more radical and more emphatic than the other. The less radical resolution was submitted by request of Mr. Phelan, I believe, chairman of the railroad committee of the Travelers' Protective Association, who is employed by a large Chicago firm. The first resolution, which was discussed for an hour or two, was very radical. The less radical resolution was the one submitted by request of Mr. Phelan, and he was not able to be present at the time of the discussion on this subject.

Q. Would you care to state as to what percentage of the members of your convention are opposed to trusts, in your judgment?—A. I have already made a statement that I have received 2 communications from men favoring trusts, one unsigned and the other one an employer, and not a commercial traveler.

Q. You would not care to make a broad statement?—A. How can I tell? I assume that the traveling men of the country are a unit. One can judge very clearly the sentiments of the class from the opinion of those who have communicated with me or have talked with me or my assistants, all being opposed to trusts, of course.

Q. I will put it in another way. Do you know of any organization of laboring men in the country that is more pronounced against trusts than the commercial travelers?—A. No.

Q. Or any such organization that favors them?—A. I do not, except the combinations themselves.

Q. (By Mr. KENNEDY.) This Louisville convention to which you were a delegate was not a convention of the organization of which you are president?—A. No; a number of the members of the Travelers' Protective Association are members of our association. The ex-president and the secretary of the New York division and a number of prominent officials who have been identified with that association are also identified with the one I am president of.

Q. How many traveling men's associations are there in the United States?—A. About 82 or 83 leading associations. The largest association is the Utica Commercial Travelers' Mutual Accident Association, located in Utica, with nearly 20,000 members. I think at the convention before the last one it had about 20,000.

Q. What is the membership of the one that took this action at Louisville, that you spoke of?—A. Thirteen thousand; they are not all traveling men, by the way; they have also employers and buyers and insurance men. They will take as

a member anybody who travels occasionally, and if a man travels a day a year he can be a member of that organization. It is an accident association.

Q. Was it the influence of the employers largely that brought about this action?—A. The tabling of the resolution?

Q. Yes.—A. I think it was. I would not want to say that positively, but it was a matter of self-interest, the men evidently wishing to stand in with their houses. I would like to state my position a little more clearly. If I was employed by a trust at my present salary or a greater salary, and I believed that by opposing trusts or the formation of trusts I would lose my position, I would resign as president of the Commercial Travelers' League. I would not be present before you to-day. It is a matter of policy; a man cannot interfere with his bread and butter, you know.

Q. (By Mr. PHILLIPS.) Does this league of which you are president embrace these other confederations to which you have referred? Are they all embraced in it?—A. Oh, no.

Q. Is it a sort of federation, or is it not?—A. It is not a federation; it is an association.

Q. It is a single organization?—A. It is a single organization, with the leading commercial travelers of the United States identified with it.

Q. Have you stated the number of members at the convention?—A. Yes.

Q. Was this resolution at the Louisville convention fully discussed before it was tabled?—A. There were such attempts made and an argument on parliamentary procedure. There was quite an animated discussion. The chairman assumed the floor, the vice-chairman taking the chair, and argued the question pro and con, and said that the traveling men of this country must be either for trusts or against them, one or the other; but it was urged by the gentlemen, principally from Illinois, that it would prejudice them with their employers, would place the association in a bad light, and would interfere with the securing of members, and that as a nonpolitical body they had no business to take up the question and it was tabled as a matter of expediency.

COMMERCIAL TRAVELERS' ASSOCIATIONS—CHARACTER AND OBJECTS RESUMED.

Q. (By Mr. FARQUHAR.) How many organizations of traveling men are there in the United States?—A. About 32 as near as I can tell you—about 32 leading organizations.

Q. Has your association any State organization connected with it?—A. It has its headquarters in New York. We have an office on Seventeenth street, and we hold quarterly meetings of the board of directors at the Imperial Hotel in New York, the headquarters of the league. It is an organization that has a nominal fee for membership, \$1 a year, and it is merely for the purpose, as I said before, of doing work which the other organizations can not undertake, which would hardly be policy for other organizations to enter into. It is not a large one, but it is influential. We have as members Mr. Aldrich, of Detroit, one of the best known traveling men in the country, three ex-presidents of the Travelers' Protective Association; Mr. James Lee, of St. Louis; Mr. Watterstein, of Richmond, Va.; Col. Stephen B. Corliss, of Albany; Mr. Titus, president of the Springfield association, and many men of that stamp.

Q. And these are all associated in your league?—A. It is not a federation; it is simply an association, to unite the more positive and, I will say, more capable traveling men of the country.

Q. In other words, your league is a selection of the more aggressive men of all the associations?—A. Yes; that is the idea precisely.

Q. Your general aims and objects then are, for instance, to act in matters of transportation and legislation and the general well-being of the traveling men of the country?—A. Yes.

Q. With the social features added, I presume?—A. No.

Q. None whatever?—A. None whatever.

Q. Are there any of those organizations of traveling men that have beneficial features to them?—A. Accident?

Q. Accident or—A. (Interrupting.) Most of them are either accident or life insurance organizations.

Q. Life insurance?—A. Or organized for social reasons.

Q. Can you give us any idea how many members there are altogether in the 30 organizations in the United States?—A. Well, I can only give a guess at about 67,000, which exceeds the statistics—the census of 1890—by 9,000.

Q. (By Mr. PHILLIPS.) Do any of these organizations belong to the American Federation of Labor?—A. No.

SOME MOVEMENTS WITH WHICH COMMERCIAL TRAVELERS HAVE BEEN IDENTIFIED.

Q. (By Mr. PHILLIPS.) Is there no connection or line of sympathy between the employers and yourself?—A. Well, there has been on previous questions; it remains to be seen what sympathy there will be at present. If you will permit me, I will cite a few matters that we have been identified with. The first matter which the league took up was opposition to the antiscaling law, on the ground that it interfered with personal privileges and constitutional equities, and that matter is now dead. We assisted to elect Judge Parker to the court of appeals in New York, and to that extent we interfered with political matters, but we believed the gentleman who was on the opposition ticket would hardly declare in favor of our side should he be elected, and we used our influence to assist the election of Judge Parker, and I think that his majority was over 70,000. I authorized the issue of many thousands of circular letters. There was an article—a letter written by Mr. Bond of Albany, a lifelong Republican. He came out against Judge Wallace and told his reasons—that his decisions had been favorable, as a rule, to corporations, and that we would not have any show of favorable decisions if he was elected. I had several thousands of those sent out.

Then we asked for a mileage-book law in New York State, and after several conferences with the powers that existed at the time the Krum 500-mile mileage-book law was passed. There was a hearing before Governor Black, at which time I was the principal speaker in favor of the measure. The railroad people had present a delegation of conductors. In fighting against the antiscaling law it was intimated that we were in affiliation with the brokers, and to show that that was not the case we advocated interchangeable mileage. I worked for it faithfully. Delegations appeared before the different passenger associations. Mr. Daniels, general passenger agent of the New York Central, who was against us on the antiscaling law and the Krum mileage-book law, of course in the interest of the New York Central and the West Shore, had a number of speakers before Governor Black at the time of the hearing. He has become very friendly to the traveling men, although 2 years ago he said he would never consent to interchangeable mileage. He said last November that all men could change their minds, and if the trunk line association would not consent to interchangeable mileage, the New York Central interests would. They first issued a book, good on all roads leased or connecting with the New York Central in New York State. They have increased the value of their mileage book, and it now covers over 6,000 miles of road, good in Pennsylvania on the Philadelphia and Reading and reaching western Pennsylvania by Buffalo, Rochester, and Pittsburg. Now, I am glad to say, Mr. Daniels is one of the best friends we have. We put up a good and consistent fight, and he is now giving us more concessions than any other railroad man. The matter of interchangeable mileage in New England has been in the hands of a committee in Boston, composed of delegates from the various chambers of commerce, travelers' associations, etc., constituting what is known as the interchangeable mileage committee of New England.

Q. (By Mr. FARQUHAR.) Have you any trouble now in any of the States of the Union in respect to the commercial travelers' license?—A. No; that was the first fight with which I became actively identified, from 1882 to 1884. I opposed the taxation of commercial men in the Southern States and Territories, and, partly at my suggestion, Charles R. Skinner, the present superintendent of public instruction of New York State, who was Congressman from Jefferson County, made a fight against the tax in the District of Columbia. I think that was in 1884, and it was the death knell to the taxation of the commercial men.

Q. Under the Bradwell decision?—A. Yes.

SUMMARY OF WITNESS'S POSITION ON TRUSTS.

Q. (By Mr. JENKS.) Would you say that this is a fair summary of the position you take regarding the effects of trusts: You believe that their general effects are: (1) To reduce the cost of manufacturing, (2) to increase the price to the consumer, and (3) to lower the general standard of labor by driving men out of higher-priced positions into lower-priced positions?—A. Yes.

Q. That substantially covers the ground that you take in your paper, does it not?—A. Yes.

COMMERCIAL TRAVELERS OPPOSED TO THE ANTISCALPING LAW.

Q. (By Mr. KENNEDY.) Are the traveling men generally, outside of your organization, opposed to the antiscalping law as proposed in Congress and in the different States?—A. Yes.

Q. Can you state briefly what benefits the brokerage system has given to the traveling men?—A. Well, merely a reduced cost, a reduction in expenses; that is all there is to it. If a man is obliged to pay 3 cents a mile to the railroad company for a short journey, and if he can buy a ticket for 2½ cents a mile from a broker, who buys it from a railroad company at a lower price and possibly with a commission besides, why should he not? I really believe that the brokers would not exist if it were not for some of the railroads supporting them, the weaker lines especially. If we can save something in our traveling expenses, naturally in the end it would make us more valuable to our concerns and in line for an increased salary. Now, if the railroads will grant us interchangeable mileage—that is what we have been working for so long—we will have no use for the brokers. They were the victims of the situation, and the antiscalping term as applied was a misnomer. It should have been called antieverybody. It was against the rights of the people to make a man a criminal, as the law in New York State did as it was originally proposed—to brand a man as a criminal—if he sold a railroad ticket. We contend that when we buy a railroad ticket it is our property, and we can sell it for what we see fit. It is a question which has been discussed pro and con, and I am satisfied that the lawmakers are of the same opinion as traveling men to-day. They understand it better. Of course the railroads, the large lines, put up a very positive, a very aggressive fight until they were defeated.

Testimony closed.

THE SUGAR COMBINATIONS.

NOTE.—The Sugar Refineries Company (the Sugar Trust) was organized August 6, and ready for work in November, 1887. It controlled practically all of the sugar-refining interests in the United States, excepting 2 refineries in Philadelphia and 1 in San Francisco. Its authorized capitalization was \$50,000,000. The different companies coming into the trust surrendered their stock to a board of 11 trustees, and received back trust certificates. Profits were to be divided on the trust certificates.

On the allegation that the trust was an illegal combination the people of the State of New York brought suit against the North River Sugar Refining Company, one of the members of the trust, to annul the charter of the corporation, on the ground that in surrendering its active management to the board of trustees of the trust it was acting *ULTRA VIRES*. The case was decided under the common law in favor of the State, and the decision was upheld by the court of appeals.

As a result of this decision of the courts of the State of New York the American Sugar Refining Company was organized January 10, 1891, as a single corporation, in New Jersey, to take the place of the former sugar trust. The capital of the new company was \$50,000,000, \$25,000,000 common stock and \$25,000,000 preferred stock, the latter to receive 7 per cent cumulative dividends before any was paid on the common stock.

During the years 1890 and 1891 active competition with the American Sugar Refining Company sprang up on the part particularly of 4 large refineries in Philadelphia and vicinity, the Franklin Sugar Refining Company, the E. C. Knight & Co. Refinery, the Delaware Sugar Refinery, and the Spreckles Sugar Refinery Company—large companies, which together produced about one-third of the total product of the United States. After nearly 2 years' active competition the American Sugar Refining Company purchased these companies, and a large proportion of the capital stock of a fifth, the Baltimore Sugar Refinery Company. Of \$25,000,000 of new stock which had been authorized \$23,546,000 (one-half common and one-half preferred) was issued for purchase of these companies. In the latter part of 1896 the American Sugar Refining Company bought nearly all of the minority stock of the Baltimore Sugar Refinery Company in order to avoid difficulty with the minority interest.

At the time that it was proposed to buy the Philadelphia refineries the United States filed a bill in equity to prevent the sale of these refineries to the sugar combination. The case was, however, decided against the Government on the ground that this purchase was not in restraint of interstate commerce, and that the case therefore was not properly under the Sherman law of 1890.

In 1896 Arbuckle Brothers, producers of coffee, began the erection of a sugar refinery. The American Sugar Refining Company soon afterwards bought a majority of the stock of the Woolson Spice Company, Toledo, Ohio, in order that they might enter into the coffee business. Competition between the American Sugar Refining Company and Arbuckle Brothers continues at present in both sugar and coffee. The other chief competitors of the American Sugar Refining Company are Claus Doscher, the Mollenhauer Sugar Refining Company, and the National Sugar Refining Company.

The dividends on common stock of the company since 1891, the date of the formation of the Sugar Refining Company, have been as follows: One dividend of 4 per cent was declared in that year; 1892, 10 per cent; 1893, 2½ per cent, and since 1894 13 per cent has been declared each year in quarterly dividends. On preferred stock 7 per cent has been declared yearly to date.

The stock of the sugar combination has been sold on the New York Stock Exchange since February, 1899. Sales of preferred stock of the present company began in January, 1899. The stock has fluctuated greatly from time to time, common stock having sold as low as 57½ in January, 1899, and above 100 in 1899. The prices have fluctuated so much that the stock has become one of the leading speculative stocks of the exchange.

WASHINGTON, D. C., June 10, 1899.

TESTIMONY OF MR. STEPHEN N. BUYNITSKY.

The commission met at 11 o'clock a. m. Saturday, June 10, 1899, Vice-Chairman Phillips presiding. Mr. Stephen N. Buynitsky, of Washington, D. C., assistant chief of the customs division of the Treasury Department, testified as follows:

Q. (By Mr. JENKS.) Will you be kind enough to give your full name and address?—A. Stephen N. Buynitsky. I am at present assistant chief of the customs division of the office of the Secretary of the Treasury.

Q. How long have you been in the position which you now hold?—A. I was promoted to that position in April last.

Q. For how long have you been in the customs division of the Treasury Department?—A. For twenty-three years.

Q. What has been your special work in connection with duties on sugar?—A. It has been my special duty to ascertain the rate of drawback to be paid on exports of sugar and sirups from imported raw sugars which pay duty, the ratio of duty to be paid on raw sugar used in the production of sugar and sirup exported, less 1 per cent of deduction, as provided by law.

THE TARIFF ON SUGAR.

Q. Because of your expert knowledge of the sugar tariff the commission desired you to explain what the action of the tariff is. Will you explain the tariff on sugar, telling us in the first place about the duty on different grades of raw and on refined sugars and then about the drawbacks?—A. Paragraph 209 of the tariff act of July 24, 1897, reads as follows (reading): "Sugars not above number sixteen Dutch standard in color, tank bottoms, sirups of cane juice, melada, concentrated melada, concrete and concentrated molasses, testing by the polariscope not above seventy-five degrees, ninety-five one-hundredths of one cent per pound, and for every additional degree shown by the polariscopic test, thirty-five one-thousandths of one cent per pound additional, and fractions of a degree in proportion; and on sugar above number sixteen Dutch standard in color, and on all sugar which has gone through a process of refining, one cent and ninety-five one-hundredths of one cent per pound; molasses testing above forty degrees and not above fifty-six degrees, three cents per gallon; testing fifty-six degrees and above, six cents per gallon; sugar drainings and sugar sweepings shall be subject to duty as molasses or sugar, as the case may be, according to polariscopic test: Provided, that nothing herein contained shall be so construed as to abrogate or in any manner impair or affect the provisions of the treaty of commercial reciprocity concluded between the United States and the King of the Hawaiian Islands on the thirtieth day of January, eighteen hundred and seventy-five, or the provisions of any act of Congress heretofore passed for the execution of the same." That is the whole of paragraph 209, schedule E.

Q. What would be the amount of the duty on the ordinary raw sugar used by refiners in their business? What degree of test do you ordinarily take as a basis of calculation?—A. The sugar that is most commonly used for refining purposes I understand to be 94, 95, 96, and 97. Evidently 96 is the best refining sugar. Now, the duty on that will be 0.95 for the first 75 degrees; and 0.035 multiplied by 21, from 75 to 96, in addition to the 0.95, will make 1.685.

So that the tariff upon raw sugar of 96 degrees test is 1.685 cents?—A. Yes;

AMOUNT OF REFINED SUGAR OBTAINED FROM A HUNDRED POUNDS OF RAW SUGAR.

Q. How much sugar of that grade does it regularly take to produce 100 pounds of refined sugar?—A. According to the data collected by the special commission of the Treasury Department in 1898 the average quantity of refined sugar produced from 100 pounds of sugar testing 96 was 92½ pounds.

Q. Is that the regular figure that is officially employed by the Treasury Department?—A. Yes; in the computation of the particular rates of drawback on the refined sugar imported.

Q. Have you figured out, or can you tell, us what the regular tariff would be on enough raw sugar to produce 100 pounds of refined granulated sugar?—A. I have not made any such calculation, but it is easily made from these figures here. (Witness produces paper.) Here is circular No. 183, of October 12, 1898, fixing the rates of drawback on sugar and sirup. The product of raw sugar of 96 degrees is rated here at \$1.79 cents per 100 pounds of refined; that is, sugar refined from raw cane sugar. We have 2 columns, 1 for sugar refined from raw cane sugar and another for that refined from raw beet sugar. The rate on that refined from raw cane sugar, 96 degrees, is given at \$1.79 per 100 pounds exported.

[1898. Department Circular No. 183. Division of Customs.]

DRAWBACK ON SUGAR AND SIRUP.

TREASURY DEPARTMENT, OFFICE OF THE SECRETARY,
Washington, D. C., October 12, 1898.

To officers of the customs and others concerned:

On the exportation of sugar and sirup refined wholly from raw sugar imported under the act of July 24, 1897, a drawback will be allowed equal in amount to the duty paid on the sugar used in the manufacture, less 1 per cent of such duty.

SUGAR.

1. When the exported sugar is "hard refined," commercially known as loaf, cut loaf, cube, granulated, crushed, or powdered, testing by the polariscope 99.5 degrees or above, and is refined wholly from one grade of raw cane or beet sugar, used separately, the rate of drawback thereon for each 100 pounds exported, and the corresponding charge on the record of importation, for the kind of raw sugar identified, shall be as shown in the following schedule for each degree of polarization, and for fractions of a degree in proportion:

Schedule of rates for hard refined sugars.

REFINED FROM RAW CANE SUGAR.

Polarization of raw sugar used.	Rate of drawback on each 100 pounds exported.	Charge record of importation for each 100 pounds exported.	Polarization of raw sugar used.	Rate of drawback on each 100 pounds exported.	Charge record of importation for each 100 pounds exported.
Degrees.	Dollars.	Pounds.	Degrees.	Dollars.	Pounds.
99.....	1.83	102.23	86.....	1.60	119.85
98.....	1.82	103.70	85.....	1.58	121.54
97.....	1.80	104.65	84.....	1.56	123.32
96.....	1.79	106.23	83.....	1.53	124.39
95.....	1.77	107.27	82.....	1.51	126.36
94.....	1.76	108.98	81.....	1.48	127.59
93.....	1.74	110.12	80.....	1.45	128.89
92.....	1.72	111.33	79.....	1.42	130.28
91.....	1.70	112.58	78.....	1.39	131.75
90.....	1.68	113.90	77.....	1.36	133.33
89.....	1.66	115.24	76.....	1.33	135.03
88.....	1.64	116.72	75.....	1.29	135.79
87.....	1.62	118.25			

REFINED FROM RAW BEET SUGAR.

98.....	1.82	103.71	91.....	1.72	113.91
97.....	1.80	104.66	90.....	1.70	115.26
96.....	1.79	106.24	89.....	1.69	117.37
95.....	1.78	107.88	88.....	1.67	118.87
94.....	1.76	108.98	87.....	1.65	120.44
93.....	1.75	110.76	86.....	1.63	122.10
92.....	1.74	112.63			

2. When sugar of one kind, but of different grades, is used in a "melt," the quantity of each grade so used must be shown in the drawback entry, and the drawback on hard refined shall be computed on the basis of the several percentages identified and the rate prescribed for each grade.

3. When cane and beet sugars are mixed in refining, the drawback entry must show the quantity of each kind and grade of sugar used in the manufacture, and in liquidation of entries the drawback on hard refined, for the several percentages of each kind and grade of raw sugar used, shall be determined in the same manner as if the sugars identified had been used separately.

4. When duty has been levied and paid on imported sugar under the provisions of section 5 of the tariff act, such duty, computed on the basis of the amount "charged" in the foregoing schedule for each kind and grade of raw sugar identified, shall be used in determining the rate of drawback due on hard refined sugar, in addition to the duties otherwise imposed by the said act.

5. When "soft refined" sugar is exported, the drawback thereon shall be apportioned to that on hard refined made from the same kind and grade of raw sugar, on the basis of its polarization and an assumed polarization of 100 degrees for hard refined. For determination of drawback, all refined sugars polarizing less than 99.5 degrees shall be regarded as soft refined.

6. The preliminary entry must show the marks and numbers of the shipping packages, with their average gross and net weights, and the kinds of refined sugar contained therein, describing the same, separately, by their commercial designations.

7. The drawback entry must show the quantity and polariscopic test of each kind of sugar exported, and samples shall be taken as ordered by the collector to

be submitted to the appraiser for verification of the declared test, but in no case shall the test used as the basis of allowance of drawback exceed such declared test.

8. In the sampling and testing of exported refined sugars, the same general rule shall apply as in the case of imported refined sugars. The regulation round tin sample box shall be used for preserving the samples, which, in the case of soft refined sugar, must be firmly packed full, and the cover placed thereon at once.

The sugars shall be sampled with a trier specially provided for the purpose, and the sample shall be drawn from the middle of the package. Such percentage shall be taken as in the judgment of the sampling officer may be necessary to afford a fair representation of each kind of sugar in the shipment, and all samples must be sent promptly to the appraiser for report of test.

SIRUP.

9. The drawback on sirup shall be as follows: On sirup valued at 3 cents per gallon or less, $1\frac{1}{2}$ cents per gallon; on sirup valued above 3 cents and not above 14 cents per gallon, the drawback shall equal one-half the value of the sirup; on sirup valued above 14 cents per gallon, 7 cents per gallon.

10. The values herein named are the values "in tank" at the refinery, *in condition as thrown finally from the centrifugal in the regular process of sugar manufacture*. When, after such process, the sirup has been passed through filters, or subjected to treatment, other than mixing in the vacuum pan, whereby its character and value have been enhanced, the fact must be shown in the drawback entry, and a deduction must be made therefor of 4 cents per gallon, in addition to the usual deduction from the price "free on board," to find its value as a basis for determining the rate of drawback. When the sirup is exported in condition as thrown from the centrifugal, in the sense herein explained, such fact must be declared in the drawback entry.

11. When the exported sirup has been produced by boiling wholly imported molasses for the purpose of extracting sugar therefrom, the drawback on such sirup per gallon shall equal four-fifths of the duty paid per gallon on the imported molasses used, and the remaining duty shall be applied as drawback on the sugar product, when exported, on the basis of the quantity of sugar extracted: *Provided*, That in no case shall allowance be made on a quantity of sirup in excess of 50 gallons for each 100 gallons of imported molasses identified, and that when the sugar product, or any part thereof, is exported, the total quantity of sugar produced from the imported molasses identified must be declared in the drawback entry.

12. To find the quantity to be charged on the record of importation when the exported sirup has been refined from raw sugar, divide the drawback allowed on the sirup by the duty paid per pound on the raw sugar identified.

13. Values declared in drawback entries, as herein provided, must be verified by the collector and quantities by United States weighers and gaugers prior to liquidation of entries.

W. B. HOWELL,
Assistant Secretary

Q. Will you explain again just what that is you are giving?—A. That is the rate of drawback allowed on 100 pounds of exported refined sugar obtained from raw cane sugar testing 96 degrees.

Q. Is the drawback supposed to be the full amount of the duty that is paid for bringing such sugar into the country?—A. It is the full amount of the duty paid on sugar brought into the country and used in the production of refined sugar, less the proportion of duty reserved for the sirup.

Q. Yes. Let us take up that afterwards. What is the duty upon enough sugar of 96 degrees centrifugal to manufacture 100 pounds of granulated sugar? If I understand the figures you have given, would not that be arrived at by adding to \$1.685, which you said was the duty on 100 pounds, the duty on $7\frac{1}{2}$ pounds?—A. Yes; that is, take 10,000 and divide it by 0.925 and you get figures representing the number of pounds of raw sugar used in refining.

Q. Then the duty is calculated on that? Now, can you give us those figures? I should like to find out, if possible, just what amount of raw sugar, in the opinion of the Treasury Department, is used to produce 100 pounds of refined.—A. 108.1 pounds.

Q. Then the duty upon that amount?—A. To find the duty on that number of pounds, 96 degrees, I multiply 108.1 by 1.685.

Yes?—A. 182.148.

What was it?—A. 182.148.

Q. Then, what is the duty at present upon 100 pounds of refined granulated sugar?—A. The duty upon refined sugar imported?

Q. Yes.—A. It is \$1.925.

THE DIFFERENTIAL DUTY ON REFINED SUGAR AND RATES OF DRAWBACK ON EXPORTED.

Q. What is the difference between the duty on 100 pounds of granulated sugar and upon the amount of raw sugar that it takes to manufacture that much refined? Do you get that by subtracting?—A. That difference was calculated at the time by the Senate committee at \$1.825 per 100 pounds.

Q. According to the figures you have just given, how much would it be?—A. 1.82148. Very nearly 1.825, which would be the duty on refined sugar of 100 degrees.

Q. Yes.—A. Carry that, say, from 75 to 100 at the rate prescribed of 0.035 to a degree, and it would make the duty on refined sugar testing 100, if such were imported, just 1.825.

Q. That is the difference that you make also between the present duty on refined sugar and upon a sufficient amount of raw sugar to produce that?—A. Very nearly. You see I make it 1.82148 instead of 1.825.

Q. Yes.—A. It is very near.

Q. How much then, according to your figuring, is the differential duty on refined sugar per 100 pounds or per pound at the present time?—A. 125.

Q. There is a differential duty in favor of the refined sugar.—A. Of 125.

Q. Of 125; yes.—A. It is supposed to be equal to the duty which would have been paid on the whole quantity of raw sugar necessary to produce 100 pounds of refined sugar.

Q. Will you repeat again what you have just said?—A. This differential duty is exactly equal to the duty which would have been paid on the quantity of raw sugar necessary to produce 100 pounds of refined.

Q. Yes. Did you not say that it took 108.1 pounds of 96-degree test to make 100 pounds of the refined sugar?—A. Yes.

Q. And what is the amount of the duty upon the 108.1 pounds of 96 test?—A. 182.148.

And what is the duty upon refined at present?—A. 1925.

1925. It is substantially equivalent to the other difference you make out. So you make the difference upon this amount substantially equivalent to the other?—A. Wait a moment; pardon me. It is 195. I made a mistake in saying 1925. It is 195.

Q. 195; and then what will the differential be?—A. 12.852.

Q. Does it not amount to this then that at the present time there is what we may fairly call a protective duty upon refined sugar?—A. Yes; of 12.852; and that, I understand, comes from the improved methods of refining which now yield more sugar from 96 than they obtained at the time when the schedule was enacted.

Q. This present schedule was made in 1897, was it not?—A. The schedule of rates of drawback was made in October, 1898.

Q. In October, 1898; and when was the law passed?—A. The law was passed July 24, 1897.

THE EFFECT OF IMPROVED METHODS OF PRODUCTION.

Q. So you think this differential in favor of refined sugar comes about by the improved methods of production that have been adopted since 1897?—A. Since 1896, perhaps, because the schedule of 1897 was, of course, based upon statistics collected the year before.

Q. Was the proportion of 92½ pounds of refined sugar to 100 pounds of raw sugar settled upon by the Treasury Department in 1898?—A. Yes; in 1898.

Q. What had the figures been before that time?—A. The figures before that time?

Q. Instead of 92½ pounds, it was what?—A. Instead of dividing by—

Q. (Interrupting) 92½?—A. 92½; we divided by 92.

Q. That was the only point?—A. It showed that more raw sugar was required to make 100 pounds of refined sugar than is now required.

Q. Do you think the present rate is more accurate than the former was; that is, that 92½ is more nearly accurate than 92?—A. I think both are exactly the same in accuracy. If they could produce 92 pounds then, the schedule then was accurate. If they now produce 92½, the schedule of rates of drawback is also accurate.

Q. Yes. Of course, it is expected that there will be regular improvement in

methods of production. When the law has been passed and the rate has once been fixed, it is likely, if that law stands for 10 years, to be somewhat behind the times?—A. Most likely.

Q. As the old law was. Now, is it not your opinion that before the law of 1897 was passed it would have been more nearly accurate to have the basis of reckoning 92½ instead of 92? That is, did not the change in the methods of production come before the change in the law?—A. I believe it more safe to prevent the growth of that differential within a short time by making it a little less than accurate; then in time it will become accurate. But whether it is wise legislation to provide for possible improvements in manufacture I do not know, because it would then also be wise legislation to provide for possible unfavorable circumstances.

AMOUNT OF REFINED SUGAR OBTAINED FROM A GIVEN AMOUNT OF RAW AGAIN CONSIDERED.

Q. The reason I asked you the question in this form was that you were quoted at the time the act of 1897 was under discussion as saying that, in your judgment, it would have been somewhat more accurate, according to the conditions at that time, to have assumed 93 as the product of 100 pounds of raw sugar instead of 92½?—A. I recollect having been quoted that way. Not having had any opportunity of correcting the statement at the time, I dropped the matter. But I found among my papers a memorandum drafted by me, June 29, 1897, wherein I said:

"In a statement printed in the Congressional Record of the 26th of June, 1897, reference is made to recent interviews with me, in regard to the Treasury tables of sugar drawbacks, and 13 statements are attributed to me."

As these statements are deduced from informal conversations upon the subject, none of them are accurate, and some are misleading, as shown by the following notes:

I am reported as having said:

"Nos. 2 to 5: That 8 refiners submitted statements to the committee, and that the tables were constructed by taking an average of these 8 statements."

NOTE.—I said that the basic proportion of 92 pounds refined to 100 pounds raw sugar testing 96 degrees was verified by the average of the statements.

"No. 7: That the statement containing over 94 pounds came from Cunningham, of Texas."

NOTE.—I stated that a Texas refinery, whose name I did not recollect, which reported a yield somewhere near 94 pounds, uses Louisiana sugars, which are known to give better results in refining than imported sugars.

"No. 8: That I never believed the refiners' statements and that I always estimated 93 to 93½ pounds of hard refined could be made from 100 pounds of 96-degree sugar."

NOTE.—I said that I would have preferred 93 pounds to 100, as a safer basis.

Q. When you say "as a safer basis," what do you have in mind—a safer basis for the Treasury Department?—A. Safer for the Treasury Department; safer against over allowances. [Reading.]

"No. 11: That though their (the refiners') statements were made under oath, I would not believe them."

NOTE.—I said (in reply to a remark of the interviewer) that "when refiners' statements are made under oath I have to believe them, unless I am prepared to prove perjury."

A man claiming to be a lawyer, as I do, should not say that he would not believe any man's statement under oath. When asked, if the parties are interested do you take their statements? I say, when they are under oath and I am not prepared to prove perjury, of course I have to take them.

Q. Now, before the law of 1897 was enacted, you said you would have preferred, as the safer basis, to take 93 pounds instead of 92½?—A. Yes.

Q. At the present time the Treasury is taking 92½ pounds for a basis?—A. Yes.

Q. I suppose that you would say that you would now consider it safer to take 93, or possibly 93½, on account of the improved methods of production?—A. That is, for the purpose of preventing an overallowance in some special cases; but the rates were based on averages, which is safe enough, and I myself signed the committee report in 1896 because I thought it safe enough. Personally, I might have preferred a different way of getting the result, but as a member of the committee I could have no objection to the average rate of 92, which was safe enough. It proves now it was safe enough. We have advanced only one-half pound in two years.

Q. Then, at the present time, with the changes we have made, you think that a basis of 92½ is certainly favorable enough to the refiners?—A. Yes.

And that probably no injustice would be done them now if a somewhat higher rate were taken, say 93; but, of course, one has to be sure to be fair to them. Is that your idea?—A. Yes.

Q. You think that in a great many cases no injustice would be done if you should adopt a basis as high as 93, or possibly 93½?—A. I can not tell what results might be reached by certain new combinations of degrees of raw sugar. You see the refiners use different combinations and are always experimenting upon the best results to be obtained from the various mixtures; but that is a very complicated calculation, which the Treasury Department can not make.

Q. It is, I presume, true that a great deal also depends upon the raw sugar itself, it having been found that raw sugar from different places is likely to give somewhat different results?—A. Exactly.

Q. Sometimes they may get as low as 90 pounds of refined to 100 pounds of raw, and sometimes possibly as high as 94 or 95?—A. I do not know about 95; that is a little too high; but 94 is possible with certain sugars. The Louisiana raw sugars give better results in refining than any others.

Q. So that from an especially good grade of raw sugar you may get as high as 94?—A. Yes.

Q. And this 92½ is supposed to be a fair average?—A. A fair average.

Q. Did you say that Louisiana sugars are, on the whole, the best the refiners use?—A. It is so reported.

Q. Can you give us any information with reference to the quality of sugars that come from other places. Which is the next best?—A. No; I can not give you any information on that point, because this Louisiana sugar was simply brought to my attention by Senator Caffery. In connection with my duties it has not been necessary to inquire into the different grades of sugars from different places.

Q. Do you know anything with reference to the comparative quality of the sugars that come from Cuba and the Hawaiian Islands?—A. I do not; I can not tell you.

Q. To come back to what we were speaking about a moment ago, the special point that I wish to be perfectly certain about is this, that in the present administration of the Department, according to your figuring, there is a differential duty in favor of refined sugar of 12.5?—A. I beg your pardon, 13.25; 13.25 instead of 12.5; 13½ instead of 12½.

THE DUTY ON SUGAR NOT INJURIOUS TO CONSUMERS.

Q. It is the opinion, of course, of a good many people that our sugar refiners do not need so high a duty as that. In the opinion of some, on account of the advantages that they get from combination in manufacture they need no differential duty. Have you any suggestion to make as to any law that might be passed to prevent the abuse of this differential duty in case the President or any one else should think there was an abuse?—A. The differential duty in itself can not be abused.

Q. Explain a little more fully.—A. I can not see how it could be abused.

Q. Will you tell just what you mean by that. I say that some people think that the protection that the refiners get is really injurious to the consumers of sugar and I ask you whether you have any suggestions to make.—A. No; I have not. I do not believe that it is injurious; that is not my belief. I think it is not injurious, because I find that under that very slight protection the refining interests of the United States have been growing and that the success of the refiners in their business redounds to the benefit of the public—of the sugar consumer. I am one of the greatest consumers of sugar in the United States. I use more sugar than double the per capita sugar consumption of the United States. I know very well that 20 years ago I had to pay 10, 11, and 12 cents a pound for refined sugar. Now I pay only 5 cents; I pay as much now, and have double the quantity to consume, so I do not see that a differential has done any wrong to the public.

TRUSTS OR COMBINATIONS MAY BE INJURIOUS.

But I see that a combination of the manufacturers of any article, call it trust or industrial combination, may become a menace to the welfare of the country if they abuse their power by using it in certain ways; as, for instance, if, after crushing the competition of small manufacturers by underselling their goods, they attempt to raise the market prices of the monopolized products on the one hand and on the other crush the workingmen employed by them in order to reduce the cost of production. Then they may become public enemies.

Q. Yes.—A. How to prevent or punish such a possible crime against the Commonwealth is a puzzling and troublesome question. In saying this, of course I

speak of something with which I have no official connection; we do not know anything in the Department about trusts and combinations.

Q. Of course not.—A. I speak as a citizen of the United States who reads the papers and tries to understand them. It is possible that a combination of manufacturers may become a menace to the Commonwealth, but how to prevent it and how to punish it is a puzzling question; and the newspapers, notwithstanding the great ability of our newspaper men, have not yet satisfactorily solved that problem. One way suggested is by legislation by the different States; another way is by legislation of the United States. Having had much to do with tariffs, it naturally suggested itself to my mind that tariff legislation might in some way be an instrument for preventing the abuse of combination; and in anticipation of coming before the commission I drafted a little bill, not as a perfect measure but as a suggestion, that might be of some use later. I will read it.

Q. Yes; I shall be obliged if you will read it.—A. (Reading):

A BILL.

To provide for the reduction of import duties in certain cases on articles, the manufacture of which is controlled by combination of manufacturers.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That whenever the President of the United States shall be satisfied that the manufacture of any article subject to import duty under the law then in force is monopolized, and the price thereof to the consumer is controlled by a combination of manufacturers of the same, and that such combination results in the lowering of the wages of its operatives and an inflation of the price beyond a reasonable profit over the cost of production, he shall provide by proclamation for the reduction, during a specific period, not exceeding 5 years, of the duties imposed on such article by such law to the extent of not less than 5 per centum nor more than 20 per centum thereof, and thereafter the duty which shall be collected by the United States upon the article designated in such proclamation shall be the duty so reduced.

Q. If I understand the purport of your bill, applied to the sugar combination, it would amount to this: That if, in his judgment, the President of the United States thought the sugar combination injurious to the consumers of sugar throughout the country, it would be within his discretion to reduce the tariff on refined sugar to the extent of 20 per cent for 5 years?—A. Yes.

Q. (By Senator MALLORY.) I notice that you make both of these conditions necessary, viz, an increase in the price of the article and a decrease of wages. Do you think it would be dangerous if it gave him the power to issue such proclamation on the existence of one condition, an increase of the price, for instance, or a decrease in wages. Either of them by itself is an evil. Is not an increase of the price to the public an evil of considerable importance in itself?—A. It is not an evil if it is comparatively slight. Suppose they sell sugar now at 5 cents and to-morrow find a way of producing it at a cost of 4 cents and continue to sell at 5, the consumer is not unfavorably affected.

Q. No; that is not the question.—A. Their income is greater and they derive it from a legitimate source—from an improvement in manufacture. Why should we punish them?

Q. Would that be an increase of price?—A. It would be.

Q. Would that not be simply allowing the price to remain at what it was before?—A. But it would be a price above the cost of manufacture.

Q. Oh, yes.—A. If they reduce the cost of manufacture by introducing machinery or some new methods, there is no reason why they should not reap the benefit of it so long as the public pays the same price; but if they reduce the cost of manufacture at the expense of the operatives, then the law would intervene. The public might not lose anything, but the operatives would, and in that case the law would intervene and open a free—a comparatively free—market to importation, and naturally reduce prices and bring them to terms.

Q. Well, as I understand your bill, a combination might reduce wages 90 per cent, but still the President could not issue such a proclamation unless they also increased the price. Now, if the production of sugar is in the hands of a combination, and if they are selling at 5 cents to-day and to-morrow raise the price to 7 cents all over the United States, would not that in itself be sufficient reason for the President to issue his proclamation without any reference to a reduction of wages?—A. It would, and therefore I suggest the word "or" instead.

Q. (By Mr. JENKS.) Instead of the word "and," before the words "an inflation," you would put the word "or"?—A. Yes.

Q. So it would read (reading) "and that such combination results in the lowering of the wages of its operatives, or an inflation of the price beyond a reasonable profit over the cost of production," etc.—A. Yes. This is a somewhat socialistic standpoint, but our minds can not help the influences of socialistic ideas falling in the way. We want to protect the operatives.

THE SUBJECT OF DRAWBACKS EXPLAINED.

Q. (By Mr. JENKS.) Will you explain to us the drawback on sugars and sirups exported?—A. The tables here submitted will give you the exact figures of the rates of drawback. All I can explain to you now is the general method of doing this.¹

Q. That is what we wish.—A. The committee investigating the proper rates of drawback to be allowed on sugar and sirups exported first of all ascertained the number of pounds of sugar of a certain degree necessary to produce a hundred pounds of refined sugar. At the same time they ascertained how much sirup would result from the operation of producing a hundred pounds of refined sugar from the required quantity of raw sugar of a certain degree. Having found how much raw sugar it took to make a hundred pounds of refined and the amount of sirup resulting from the operation, they took the duty on the number of pounds of raw sugar found to be necessary and apportioned it between the refined sugar and the sirup according to the quantities and the market prices. It may be reasoned in this way: If a pound of refined sugar is worth 4 cents and a gallon of sirup 6 cents, they will find what part of the value of the imported material is contained in the sugar and what part in the sirup and divide the total amount of drawback due, or duty due as drawback, between the sirup and the sugar in proportion to the values of imported material found to be contained in the product. It is a double proportion and complicated, but it is only arithmetical; and in this way they constructed these tables. Under the former tariff, the duty being ad valorem, the whole drawback was figured on the number of pounds of raw sugar used, and the number of pounds was calculated in accordance with the principle I have just explained, of distributing the duty between the sugar and the sirup in proportion to the values of the materials found therein. These tables will therefore show you that on sugar 96° test the duty of 107.47 pounds was attributed to the refined sugar. Under the present ratio, the duty being specific, the drawback has been calculated in dollars and cents, but the system of distributing the drawback between the sugar and the sirup has been the same. Now here you will find a column entitled "Charge record of importation for each 100 pounds exported." Now for each 100 pounds of refined sugar made from 96° test the charge to the record of importation is 124 pounds. That covers all the sugar used in refining and all the sugar which goes into the sirup, and the figure is very ample in order to prevent reference to importations that have been exhausted by exporting. One hundred and twenty-four pounds is a very high figure, but inasmuch as the present committee, or the latest committee on the drawbacks, found it necessary to get the average drawback on sirup, instead of so much per pound on the sugar contained in the sirup, they found it possible to make the average here. The drawback on sirup is as follows: "On sirup valued at 3 cents per gallon or less, the drawback shall be 1½ cents per gallon; on sirup valued at 3 cents and not above 14 cents per gallon, the drawback shall be one-half the value of the sirup; on sirup valued above 14 cents per gallon, the drawback shall be 7 cents per gallon." They made very elaborate calculations showing that these averages exactly meet the postulates of the system of distributing the duty between refined sugar and sirup. On reading the very elaborate report there was no doubt in my mind that it was correct.

Q. The information was, I suppose, largely gathered at the refineries?—A. Yes. They went to the refineries and examined the books and had statements made to them; the refineries opened their books to the investigation of the committee freely, and there was no secret about it.

COUNTERVAILING DUTIES EXPLAINED.

Q. Will you also explain for us the subject of countervailing duties?—A. Yes. It is one of the most delicate and difficult duties imposed upon the Secretary of the Treasury by the existing law.

¹ See Circular No. 183, p. 44.

[1898. DEPARTMENT CIRCULAR No. 199. Division of Customs.]

ADDITIONAL DUTIES ON SUGAR IMPORTED FROM, OR THE PRODUCT OF, COUNTRIES PAYING BOUNTIES ON THE EXPORT THEREOF.

TREASURY DEPARTMENT,
OFFICE OF THE SECRETARY,
Washington, D. C., December 12, 1898.

To Officers of the Customs and others concerned :

Section 5 of the act of July 24, 1897, provides as follows :

That whenever any country, dependency, or colony shall pay or bestow, directly or indirectly, any bounty or grant upon the exportation of any article or merchandise from such country, dependency, or colony, and such article or merchandise is dutiable under the provisions of this act, then upon the importation of any such article or merchandise into the United States, whether the same shall be imported directly from the country of production or otherwise, and whether such article or merchandise is imported in the same condition as when exported from the country of production or has been changed in condition by remanufacture or otherwise, there shall be levied and paid, in all such cases, in addition to the duties otherwise imposed by this act, an additional duty equal to the net amount of such bounty or grant, however the same be paid or bestowed. The net amount of all such bounties or grants shall be from time to time ascertained, determined, and declared by the Secretary of the Treasury, who shall make all needful regulations for the identification of such articles and merchandise and for the assessment and collection of such additional duties.

In pursuance of these provisions, the following amounts of bounties respectively paid or bestowed, directly or indirectly, on the export of sugars by the countries hereinafter named, are hereby declared for the assessment of additional duties on sugars imported from, or the product of, such countries or their dependencies, viz:

ARGENTINE REPUBLIC.

On sugars produced in the country since January 20, 1897, and exported with benefit of drawback, 6 centavos per kilogram.

AUSTRIA-HUNGARY.

On sugar under 93 per cent and at least 88 per cent polarization, 1.37 florins per 100 kilograms.

On sugar under 99½ per cent and at least 93 per cent polarization, 1.46 florins per 100 kilograms.

On sugar at least 99½ per cent polarization, 2.10 florins per 100 kilograms.

DENMARK.

On refined sugar produced wholly from beets grown in Denmark, 1.12 crowns per 100 kilograms.

FRANCE.

Raw sugars of the standard of 65 to 98 per cent for beet-root sugars, or of 65 to 97 per cent for French colonial sugar per 100 kilograms of refined sugar, 100 per cent, 10.82 francs.

Sugar candies calculated at their legal equivalent, per 100 kilograms, effective weight, 11.51 francs.

Refined sugars in loaf or crushed, clear, hard, and dry, per 100 kilograms, effective weight, 11.51 francs.

Raw and refined sugars in grains or crystals of a minimum standard of 98 per cent, 11.17 francs.

The output of refined sugar from raw is calculated by deducting from the polarization of the raw sugar twice the glucose, four times the ashes, and 1½ per cent for loss in refining.

GERMANY.

On raw sugar at least 90 per cent polarization, and on refined sugar under 98 per cent and at least 90 per cent, 2.50 marks per 100 kilograms.

On candy and sugar in white, hard loaves, blocks, crystals, etc., at least 99½ per cent, 8.55 marks per 100 kilograms.

8. On all other sugar at least 98 per cent, 8 marks per 100 kilograms.

THE NETHERLANDS.

On raw sugar produced in the country from beets, and testing less than 98 per cent, 2.2354 florins per 100 kilograms of hard refined (100 per cent).

On raw beet sugars testing 98 per cent or above, three-fourths of said bounty, viz, 1.7655 florins per 100 kilograms of hard refined.

On refined beet-root sugars, 0.2946 florin per 100 kilograms of hard refined (100 per cent) in addition to the above bounties.

On refined sugar from other materials than beet-root raw sugar produced in the country, 0.2946 florin per 100 kilograms of hard refined.

The output of refined sugar from raw is computed by deducting from the polarization of the raw sugar twice the glucose, four times the ashes, and 1½ per cent for loss in refining.

RUSSIA.

On sugar testing not less than 99 per cent per pood (36.113 pounds avoirdupois), 0.50 rouble. One rouble equals 51½ cents.

On sugar testing not less than 88 per cent per pood, 0.44 rouble.

On sugar testing not less than 75 per cent per pood, 0.38 rouble.

Every invoice of sugar must be accompanied by a certificate of the United States consular officer at the port of shipment to the United States, naming place and country where the merchandise was produced, and, in the case of refined sugar, naming also the country of production of the raw sugar, molasses, or sirup used in the refining.

The liquidation of entries of sugar not accompanied by such certificates shall be suspended, and the estimated duties shall include an amount sufficient to cover the additional duty to which such sugar may be apparently liable.

The conversion of the several foreign currencies mentioned above into United States money will be governed by the provisions of section 25 of the act of August 28, 1894.

The question as to the net amounts of the bounties indirectly bestowed by the Government of Belgium on exported sugars is under consideration. Pending the ascertainment and determination of said amounts, entries of sugars imported from, or the product of, that country will be subject to the provisions of circular No. 174, of October 19, 1897 (synopsis 18481).

L. J. GAGE,
Secretary.

When you consider that the countries paying export bounties on sugar have been trying for years to conceal from each other and from the world at large the ways in which such bounties are bestowed, and when you consider that the legislatures of the different countries have used their own language in legislating upon that matter, you may conceive in a slight degree, at least, what the difficulties which confronted the Secretary of the Treasury in ascertaining these facts must have been. Some of the foreign countries have recently, comparatively recently, concluded that there is no use concealing, and in addition to the concealed bounty have given straight bounties on exports. Germany, Austria-Hungary, and France have done so. The concealed bounties most levied were the result of the taxation of sugars, on the basis of production, from beet roots, which was less than the actual production. Now, for instance, if the product of 100 pounds of beets is 7 pounds, the tax will be levied on 6 pounds, and 1 pound will go free. When the sugar is exported the whole of the tax is remitted. You say, Where is your bounty? We levy a tax on 6 pounds of sugar consumed here, and remit the tax on 6 pounds. But where is the other pound? That pound was not exported; it was more profitable to the producer of sugar to sell free sugar at home at the price of the taxed sugar and to export the taxed sugar with a remission of the tax. They did that in Belgium, in France, in Germany, in Austria-Hungary, and, I am sorry to say, in my old country, Russia. I felt a little delicate about showing up that concealed bounty in Russia because my former liege and sovereign might have taken exceptions to such action, and so I washed my hands of the whole thing. I submitted the case to the Assistant Secretary, and stated to him that I

might be suspected of undue partiality toward my old country. I said, "There are the facts; you decide for yourself." He decided there was a bounty.

Q. You gave him the facts in detail?—A. Yes; he said there was a bounty, and so we proclaimed it; and there it is, and a big one, too. In Russia all sugar testing less than 99 per cent is .5 of a rouble per pood; that is, in Russian, pood. That, however, is the unit we had in Russia, equal to 106.130 pounds of sugar. Testing not less than 99 per cent, this corresponds to about 25 cents—25 cents on 6 pounds; that is a very big bounty. The official correspondence of the Secretary of State shows that the Russian Government denies the existence of any bounty. These figures were reached by the Assistant Secretary by taking the difference between the cost of production and the price for exportation. The price for exportation was, by these figures, lower than the cost of the production.

Q. Were you able to find out the cost of production there then?—A. Yes, the cost of production is generally so much per pood.

Q. How much is it per pound?—A. It was about 2 roubles, or 2½ roubles, per pood.

Q. Can you give us the cost of production in English figures?—A. I am sorry, but I can not—I can not do it; I will not undertake to figure from memory; I have a very poor memory for figures.

Q. Then you were able to find that Russia also gave an export bounty?—A. I was not.

Q. You were able to get the figures for the Department?—A. I was unable.

Q. Then the Department was able to find it?—A. Yes, the Department was able to find it, but I was not.

Q. Then these countervailing duties are simply additional duties imposed here to even or balance export bounties paid by foreign countries?—A. Yes; they place sugars imported from countries not paying bounties on the same basis as countries that pay export bounties.

Q. So as far as the question of protection on sugar is concerned, do the countervailing duties have anything to do with it?—A. They have nothing to do with it; there is really no protection in that.

Q. Have you anything further to bring out with reference to these countervailing duties?—A. I might say that the bounties we have spoken of were determined and proclaimed after a very careful and minute investigation in most cases and after conferences with the representatives of the country affected. The representatives all came to see the Secretary and pleaded their side.

TREATIES AFFECTING IMPORTATION OF SUGAR.

Q. Are there any reciprocity treaties that affect the tax on imported raw sugar?—A. I do not know of any reciprocity treaty except the Hawaiian.

Q. What are the conditions at present with reference to the importation of sugar from the Hawaiian Islands?—A. I do not know that the accession has as yet changed the conditions; we are waiting for further action by Congress.

Q. Will you tell us just what the conditions were in order that we may get it on record?—A. I thought the Hawaiian treaty was appended to this new tariff, but I see it is not. We used to have it appended to the publication.

Q. Will you state what it is, so that we can get it on record?—A. I will read you the section of the tariff act which applies to the Hawaiian treaty. I have not the provisions of the treaty.

Q. Will you read again that part of the section that you read before?—A. Yes. Paragraph 209, Schedule E, tariff act, July 24, 1897, reads as follows:

"Sugars not above number sixteen Dutch standard in color, tank bottoms, sirups of cane juice, melada, concentrated melada, concrete and concentrated molasses, testing by the polariscope not above seventy-five degrees, ninety-five one-hundredths of one cent per pound, and for every additional degree shown by the polariscopic test, thirty-five one thousandths of one cent per pound additional, and fractions of a degree in proportion; and on sugar above number sixteen Dutch standard in color, and on all sugar which has gone through a process of refining, one cent and ninety-five one-hundredths of one cent per pound; molasses testing above forty degrees and not above fifty-six degrees, three cents per gallon; testing fifty-six degrees and above, six cents per gallon; sugar drainings and sugar sweepings shall be subject to duty as molasses or sugar, as the case may be, according to polariscopic test: *Provided*, That nothing herein contained shall be so construed as to abrogate or in any manner impair or affect the provisions of the treaty of commercial reciprocity concluded between the United States and the King of the Hawaiian Islands on the thirtieth day of January,

eighteen hundred and seventy-five, or the provisions of any act of Congress heretofore passed for the execution of the same."

Q. So that provision still remains in force?—A. Yes.

AFFIDAVIT.

WASHINGTON, D. C.

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

S. N. BUYNITSKY.

Sworn and subscribed before me this 12th day of September, 1899.

[SEAL.]

JAS. N. FITZPATRICK,
Notary Public.

WASHINGTON, D. C., June 12, 1899.

TESTIMONY OF MR. G. WALDO SMITH,

President of the Wholesale Grocers' Association of New York City.

The commission met on Monday, June 12, 1899, at 2 p. m., Vice-Chairman Phillips presiding. Mr. G. Waldo Smith, of New York City, president of the Wholesale Grocers' Association of New York City, being first duly sworn, testified as follows:

Q. (By Mr. JENKS). Will you kindly state your full name and address to the stenographers?—A. G. Waldo Smith. My present address is College Point, Long Island, N. Y.

Q. What is your business?—A. Wholesale grocer.

ORGANIZATION AND OBJECT OF THE WHOLESALE GROCERS' ASSOCIATION.

Q. You are also connected, I believe, with the Wholesale Grocers' Association?—A. Yes.

Q. In what capacity?—A. As president.

Q. You will tell us briefly what the nature of this Wholesale Grocers' Association is?—A. It was formed 11 years ago, to improve the condition of the trade in all ways possible. It is a voluntary association; not incorporated. That was the simple purpose—to improve the condition of the trade.

Q. In what different ways has it gone to work to do that?—A. First by putting a limit on some goods that were sold at cost, such as sugar, Royal baking powder, and bakers' goods—that is to say, they were sold at net cost. They were about one-third of the aggregate of the business, and bankruptcy stared us in the face. We would buy \$1,000 worth of sugar and could not get \$1,000 and 1 cent for it. We finally agreed that we would buy sugar and sell it at a quarter of a cent a pound advance. That lasted for a year and a quarter.

Q. About what time was this arrangement made?—A. About 10 years ago last October.

Q. Was this arrangement made by the officers of the Wholesale Grocers' Association?—A. No; it was made at a meeting of the whole association.

Q. Was it a formal agreement, put in writing?—A. No; I do not think it was. We agreed to it in the organization informally and passed a resolution verbally. Notice was then sent out to those who were not there, stating what we had done.

Q. Please go on.—A. We maintained that price for a year and a quarter. Then a new house came in and cut the price and reduced the profit to one-eighth of a cent a pound.

Q. What house was that?—A. Todd & Co., a very small house. That went on for 6 or 8 months, and they began to cut the price and paid no attention to that agreement, so that we were reduced to the original status of handling goods for nothing. That was the end of that arrangement. Then we passed a resolution that we would never limit the price again ourselves. We could not maintain it. The one hundredth man made the price and the 99 men had to consent.

Q. Has the Wholesale Grocers' Association had any other arrangement with reference to the sale of sugar?—A. Not as an association.

THE FACTOR SYSTEM.

Q. What have your arrangements been since?—A. Some of us then went to the refiners. There was practically only one refinery at that time—the American Sugar Refining Company.

Q. You say that there was practically only one refinery at that time?—A. Practically only one, and we asked them what they could do to help us.

Q. One moment, please. You say that there was practically only one at that time?—A. The Revere at Boston was the only other one I knew of. There was nothing in New York or Philadelphia, but since then they have been coming in. Mollenhauer came afterwards and quite a number of others.

Q. And since then have come the Arbuckles and quite a number of others?—A. Yes; they all came in afterwards.

Q. Very well. Will you please tell us what arrangements you made with the American Sugar Refining Company?—A. We asked them to adopt certain definite fixed terms of sale.

Q. You said that a number of you went to them to make that arrangement. Was it the Wholesale Grocers' Association, or did a number of you go to them as individuals?—A. Oh, we went as individuals. They came from Boston, Providence, and Newark, different ones at different times.

Q. This was, of course, done by consultation and arrangement among yourselves?—A. Yes.

Q. About what proportion of the Wholesale Grocers' Association were represented by this meeting or by this committee that asked the American Sugar Refining Company to make such an arrangement?—A. Perhaps I had better tell the story. I will get at it quicker.

Q. Very well.—A. We—that is, Mr. Thurber, who has since gone out of business, Mr. Leggett, Mr. Nichols, Mr. Seaver, of Boston, Mr. Howard Spur, of Boston, and others whose names I do not recall, and myself—went to Mr. Havemeyer and Mr. Searles and asked if some way could not be invented by which we could get a profit on sugar. We were closeted with them discussing the matter for six afternoons, and it was settled as a result of our talk that they would bill us sugar at 5½ cents and that if we maintained the price at 5½ cents, say, for 3 months, they, at the end of that time, would give us a rebate of 18½ cents a hundred. This was to be uniform to all buyers, wholesale and retail, manufacturers, and everybody. It was simply the terms by which they would sell their sugar.

Q. They would sell at the same price to everybody?—A. Yes; everyone the same.

Q. Regardless of whether or not they were represented by you?—A. No; it was no concern to us at all. It was to cover New York as far as Poughkeepsie, New England, and New Jersey.

Q. How about the grocers who were beyond these limits?—A. They came in afterwards. They saw we had a good thing and asked for the same thing.

Q. Will you go further, telling us the nature of the agreement, if there was anything further?—A. There was never any agreement. They simply said to us: "If you will prove to us that you want it, why, we may consider the matter." And we proved to them by getting all the grocers of that entire territory of New England and New York, as I have said, and a portion of New Jersey, all except three, to sign a petition that they would adopt the system.

Q. That was considerably over 90 per cent, probably about 99 per cent?—A. Ninety-five per cent was their ultimatum, and we got practically the whole. There were only 5 of them who did not sign, and they were in Europe, and no one was authorized to sign for them. It was practically unanimous.

Q. Will you please tell again clearly what the nature of the terms of sale was to be?—A. In place of granulated sugar being sold and billed at 5 cents, they would bill the sugar at 5½ and we would pay 5½, and on condition that we sold at no less than that they, at the end of 3 months, would give us a rebate amounting to 18½ cents a hundred pounds.

Q. When were you to pay for this sugar?—A. We were to pay for it in 7 days. We could get 30 days, but we could get one off for cash in 7 days.

Q. Thirty days was the time?—A. Yes.

Q. And you got one off for cash in 7 days?—A. Yes.

Q. How long did that custom or plan last?—A. It has lasted practically until the present time, although there is no enforcement of it in any way. The wholesale grocers simply buy at a certain price, and if they sell at less they get what they are paid and do not get this rebate.

Q. In case a person was not willing to abide by it, and did not maintain the price, what would be the penalty?—A. The penalty would be the loss of the rebate at that time, but for 4 or 5 years there has not been any penalty.

Q. At that time it would be the loss of this rebate of 18½ cents?—A. A hundred pounds; yes.

EFFECT OF COMPETITION AMONG THE REFINERS.

Q. At this time you say you are selling sugar under substantially the same terms?—A. Yes; but it is now purely voluntary, because, on account of the competition between the refineries, they can not enforce anything.

Q. How long has the competition between the refineries existed?—A. I should say since last August; perhaps a little later; along in September Doscher and Arbuckle came in. The Doscher concern is known as the New York Company.

Q. Since last August or September?—A. I should say about August or September.

Q. Do you recollect about what time the Doscher and Arbuckle refineries were built and put in operation?—A. About that time. I was in their offices occasionally, but I can not fix the exact date. I know it was last summer, for, living on Long Island, I was passing by their factories on the ferryboat.

Q. As soon as their refineries came into full operation did the price of sugar begin to drop?—A. The margin between 96 degrees centrifugal and granulated began to get closer.

Q. About what was the margin between 96 degrees centrifugal and granulated 2 years ago?—A. I should say about seven-eighths of a cent, although my knowledge is not definite. I do not know; I do not look at the prices close enough.

Q. Very soon after these sugars began to get on the market this margin began to lessen?—A. Yes.

Q. Do you know on which side the cut in price came first?—A. Oh, on the Arbuckle and New York.

Q. And they were followed by the American, but they started first?—A. They are usually one-sixteenth below.

Q. Below the American Sugar Refining Company?—A. Yes.

Q. What is the margin between the two?—A. My knowledge is not definite, but I should say about one-half cent, but I have no definite knowledge. I have not looked at the price in a month; perhaps not quite a month.

Q. In your own business, as a wholesale grocer, do you handle exclusively the sugar of the American Sugar Refining Company?—A. I handle the sugar of the 4 different refineries.

Q. What 4 refineries; the American, the Mollenhauer, the Doscher, and the Arbuckle?—A. We handle the sugar of all of them.

Q. You are handling now the Arbuckle and Doscher sugar, as well as the American?—A. I do not know; I have no knowledge. I am not in my store more than once in 2 or 3 days, and I do not keep track of the details.

Q. But you know that you have been handling the Doscher and Arbuckle within a month or so?—A. I can not say that.

Q. Within how long can you say?—A. Within 3 months.

Q. Then you certainly have been handling the sugar within 3 months?—A. Yes.

Q. Did you not make a distinction a moment ago between the Doscher and the Mollenhauer refineries?—A. I do not know how I made any distinction.

Q. In speaking of the competitors of the American did you not mention Mollenhauer and then withdraw his name?—A. Mollenhauer started several years ago and worked in harmony with the American Sugar Refining Company.

Q. Is he controlled by the American Sugar Refining Company?—A. He has always been working in harmony with them. They have always been in perfect harmony whether they are really one or not.

Q. You say that the prices you get from Doscher and Arbuckle are ordinarily one-sixteenth less?—A. Yes.

Q. Than the American? But the prices you get from Mollenhauer are the same?—A. Mollenhauer is practically out of the market now.

Q. Is he not running his refinery?—A. No; he was not running it the last I heard. As I have said, his prices were in harmony with the American refinery.

Q. As long as he was running he was in substantial harmony?—A. The last I heard from Mr. Post he said he was not anxious to push business when he could not make any money.

Q. Is Mr. Post one of the partners?—A. He is the salesman; he is the head of the selling department in the Mollenhauer factory. That was about 3 months ago. He told me he did not want to run his refinery, and as long as they were fighting and running in opposition he would not run it.

Q. At the present time are the only ones that can be considered as running in opposition to the American Sugar Refining Company the Doscher and the Arbuckle?—A. I said that the other is just as much in opposition, only it is not running.

Q. But I understood you to say that the prices from the Mollenhauer refinery were always in harmony with the American Sugar Refining Company?—A. Until the opposition came in; my knowledge is not definite about that. I have paid no attention to that, and had practically nothing to do with it until the commencement of this rebate system.

Q. Now, with regard to the territory outside of that covered by your association, did you say they afterwards came in under substantially the same method of doing business that you adopted?—A. Yes.

Q. How did they arrange prices for the territory further west?—A. In the same way.

Q. Did they make any difference for freight?—A. Oh, yes; there is what is called the equality book published, so that if a grocer in Watertown—I do not know where Watertown is, but we will use that name—wants to buy sugar in New York, Philadelphia, Albany, or Rochester, it will be laid down at the same price.

Q. Who determines what that price shall be?—A. The railroads, I think. Our secretary goes to the railroads and gets their freight rates.

Q. Then it is your secretary that fixes the rate book?—A. He fixes the rate; that is, the cost of transportation from Philadelphia, Boston, and New York, where these refineries are. He compares the costs of transportation and fixes the rate from each one, which is in the form of an arbitrary statement, as, the freight from a certain point to a certain point is so much.

Q. Then the wholesale grocers in Kansas City that are buying sugar from the American Sugar Refining Company pay the same as you do with the freight added?—A. I suppose so.

Q. Now, who is it that gives you the price, the American Sugar Refining Company?—A. They give us the price of their goods only.

Q. Are the rebates which they fix the same, in your judgment, barring the difference in freight, to everybody to whom they sell in the country?—A. As far as I know to everybody, to all classes of people.

Q. About what proportion of the sugar that goes into the market is furnished by the American Sugar Refining Company?—A. I have no knowledge.

THE REBATE SYSTEM.

Q. This agreement that you have with them?—A. We have no agreement, we have no agreement of any name, nature, or kind.

Q. When you have a bill of goods sent to you does not the bill contain a statement about the rebates, or is there no rebate at all now?—A. The rebate comes, but it is purely voluntary. We can sell to anybody we wish and get the rebate just as well.

Q. Is there no statement in the bill as to what the rebate will be?—A. I do not think there is, although I am not certain. I have not seen an account for several years. I know that they withdrew the affidavit 4 or 5 years ago. We had to sign an affidavit before we got the rebate, but they withdrew it 4 or 5 years ago. I remonstrated with them that it would break up our whole system.

Q. Is it, however, your experience that the withdrawal of the affidavit did not break up the system?—A. It has not, and still it has, partially. Those that do maintain it have lost lots of customers because of cutting. We have lost probably one-quarter of our sugar trade through the prices being cut by our competitors.

Q. Are you, at the present time, in the same condition as you were before this rebate system was adopted? That is, are you now selling at exact cost?—A. Oh, no, no.

Q. What rate of profit have you now?—A. Eighteen and three-fourths cents.

Q. There has been no change then?—A. Yes.

Q. No change at all since that first agreement?—A. No, except that there is always somebody who will cut prices; sometimes they will cut 2 per cent in order to get something, or make 3 per cent discount. There are various ways of cutting prices.

Q. Do the people who cut the price get the discount?—A. Certainly; there is no compulsion about the selling; it is just as they please; in fact a good many of us are in favor of opening up the whole thing.

Q. Do you think that change (the doing away with the affidavit and permitting the grocer to make his own price as he wished and still receive the rebate) was made on account of the competition of the other refineries?—A. No; it was made on account of the propensity of people to make every possible effort to get trade and to get all the business by being dishonest and selling things for less than cost. There is always one man in a hundred that will do that.

Q. You mean, then, that it was found that there were some people who would cut below the fixed price and make an affidavit that they had not?—A. No; I think it was very rigidly adhered to. I heard no complaint that amounted to anything; none that was substantiated. I think that everybody kept it honorably and faithfully.

Q. Why did they do away with the affidavit, then? What reason could they have had for withdrawing it?—A. Carelessness, I think, and the difficulty of enforcing it. They would be charged with cutting prices and our secretary would try to get the proof. It would not be satisfactory to the refiners and they would not enforce it. They got into a great deal of trouble, became careless about it, and finally let it go. They had no object in it; they had nothing to gain; it was all labor for them, and expense and trouble for nothing.

Q. The gainers were mostly the grocers?—A. Yes; we could not keep it up. I tried hard enough, I am sure.

Q. Do you deal in foreign sugars?—A. No; I do not think there is any foreign sugar imported under the new tariff bill, or if there is it is very little.

Q. I was thinking of raw sugar. Do you deal in raw or beet sugar?—A. No; I do not think any wholesale grocer deals in raw sugar.

ARRANGEMENTS FOR SELLING OTHER KINDS OF GOODS.

Q. Have you had or do you now have any similar arrangement with reference to selling other lines of products besides sugar?—A. Yes.

Q. Could you give us some other instances?—A. Babbitt's soap, Royal baking powder, and a large line that I do not now recollect.

Q. Suppose you tell us about those two. Under what conditions do you sell Babbitt's soap?—A. We buy it at \$4—I do not know what the price is—and are allowed, when we make a remittance to take off 25 cents a box if we send a statement that we have sold it at no less than \$4.

Q. You send a statement to that effect?—A. Yes. There is no affidavit. We send a simple statement; they adopted terms of sale. There is no agreement between us of any name or nature. The Royal Baking Powder Company give us, at the end of the year, 5 cents off, if we do not sell for less than we have paid.

Q. Do you have to sign a statement as to that?—A. No; I do not think we do. There is no statement we have to sign. I have never signed one. There may be, possibly, but I never saw one.

Q. Have you any forms of bills or agreements with you?—A. No.

Q. Can you furnish them to the commission?—A. Yes; I can mail you some.

Q. Will you mail us, in the first place, a statement of the forms in which you receive your bills from the sugar companies now?—A. Yes.

Q. If you can, will you send us the form you had when under the rebate system, with the affidavit form?—A. I suppose I can do that, if we have got it in the office. I do not know whether they will give it to me at the sugar refinery. I will go through the desk.

Q. Will you also furnish us the form of agreement you say you have with Babbitt's and the Royal Baking Powder Company, so that we may see how they correspond?—A. Yes.

Q. Will you be kind enough to mail those to us in a day or two?—A. Yes; within two or three days.

[Mr. Smith was unable to furnish the exact forms asked for above. He furnished the following as substitutes.]

Preamble and resolutions offered by G. Waldo Smith, president Wholesale Grocers' Association, New York and vicinity.

Whereas a very large and ever-increasing proportion of the goods handled by the wholesale grocers are manufactured articles of uniform quality and quantity in each package; and

Whereas under the laws of modern competition it is impossible to obtain a profit on such goods; and

Whereas it can not be expected, nor is it right, that either the jobber or the retailer should aid the manufacturer in placing his goods in the hands of the consumer, unless he obtain a reasonable and adequate remuneration for the service he performs; hence, the real relation between the manufacturer, the jobber, and the retailer is one that calls for careful consideration at the hands of all concerned.

The right of the manufacturer to sell directly to the consumer, or to reach the consumer through the retailer alone, can not be questioned. The only question that we can expect the manufacturer to consider is: How can he place his goods in the hands of the consumer with the least cost and trouble to himself? If he

wishes to reach and supply a million consumers, he can deal directly with, say 250,000 families, or with about 4,000 retailers, or with about 80 jobbers. To deal directly with private families is manifestly impossible for the large manufacturer. To deal directly with 4,000 retailers for each million of consumers involves an outlay for salesmen, clerks, credit clerks, lawyers, delivery wagons, etc., and an amount of detail, also losses from bad debts that few manufacturers can undertake, or, at least, except in their home city. To reach a million consumers through about 80 jobbers is a task that can easily be accomplished, and entirely within the reach of a successful manufacturer.

Some manufacturers deal directly with large retailers who discount their bills, but expect the jobbers to serve the smaller retailers who do not pay so promptly. This is manifestly unjust and unfair to the jobber.

The jobber acts as distributing agent for a large number of manufacturers, and has a plant adapted to that special work.

Under the laws that govern competition the hundredth man—and he may be a very small dealer at that—can make the price at which his 99 competitors must sell all goods of the class above enumerated. All experience proves conclusively that where no protection is afforded by the manufacturer, such goods are soon sold at about net cost, and hence involves a loss of nearly, or quite, the cost of handling them. Now, while the individual jobber may be a philanthropist, yet he certainly is not doing business for the good of the people, and, like all other men, he is in business solely and alone for the purpose of making money; and, while he may carry in stock some goods that do not pay a profit, he certainly does not push their sale, and is either endeavoring to prepare some article that will take their place, or else substitute an article that will pay a profit.

Now, the experience of the last 10 years of associated effort has proven conclusively that it is possible to adopt a plan that will not only control the hundredth man, and enable not only his 99 competitors, but he himself, also, to obtain a reasonable recompense for the service he performs.

Our experience also proves that half-way measures that hold the honorable merchant, but do not control the man who seeks to obtain an advantage over his competitors by dishonorable means, are far worse than none, and should not be tolerated for a moment.

What we want is a system that will be absolutely maintained by the manufacturer, even if it involves trouble and expense, and, perhaps, the occasional loss of a customer. We believe that such a system can be found, and we believe that the true interest of the manufacturer would be best conserved by adopting such terms of sale as could be rigidly enforced.

We further believe that all self-respecting jobbers should refuse to carry goods in stock on which a profit can not be obtained; and that where manufacturers will not do all in their power to protect the jobber from the nefarious and destructive work of the cutter, that they should be permitted to deal directly with the consumer.

Of the wisdom of the manufacturers adopting such terms of sale as will interest the jobber, there can be no doubt, if for no other reason than that the jobber distributing for many manufacturers can do it at much less cost than the manufacturer can do it for himself.

Of the question of its justice, it is only necessary to say that any system of doing business which compels anyone to perform a service for the public without a reasonable remuneration is opposed to a wise public policy and the best interests of all the people.

Of the legality of the limited price and rebate system, or the factor system, there can be no doubt, as no law ever has been or can be passed that will prevent a manufacturer adopting such terms of sale as will, in his judgment, best subserve his own interests, provided that they are uniform and work no injustice to any one class of buyers.

Therefore, in view of the foregoing, be it

Resolved, That this convention believes that a limited price and rebate system is necessary, just, and in the interest of all concerned.

Resolved, That a committee of 5 be appointed to consider all systems now in vogue and to prepare such a system as, in their judgment, will be to the interest of all concerned, and then endeavor to procure its adoption by all manufacturers whose goods we handle.

[Office of New York State Wholesale Grocers' Association, 6 Harrison street, New York.]

GENTLEMEN: At a convention of wholesale grocers, held at Niagara Falls, June 7 and 8, 1898, the undersigned were appointed a committee, with instructions to endeavor to bring about such changes in the present system of handling manu-

factured and proprietary articles as, after full investigation, might seem for the best interest of both manufacturers and jobbers.

As preliminary work, a copy of preamble and resolutions adopted at the convention, with a circular letter asking for the opinion of manufacturers and jobbers on 5 questions propounded, were sent out to all parties interested.

We have received a large number of answers from wholesale grocers, every one of which assures the committee of their approval of the movement; most of them expressing their preference for an ironclad agreement, if one could be devised, and promising their hearty cooperation in carrying out any measures that might be adopted that would improve the condition of the trade, and as far as possible put an end to the nefarious and ruinous work of the cutter.

We also received a large number of replies from manufacturers. One said that he had never tried a rebate or factor system, and hence could not give any advice. A number said they had never tried one, but earnestly desired to do so if one could be submitted that seemed workable.

Many of the largest and best known manufacturers, having business relations with the entire country, and well known to all grocers, said they were doing their business under a rebate or factor system and had been for some years; had found it satisfactory and proposed to continue it, and would gladly adopt any improved system that might be suggested.

If it were not for the fact that it would make this report too voluminous, we would like to quote from many of them, but will only give short extracts from 6 of the best known and largest manufacturers' replies.

One from Pennsylvania says: "We are satisfied that an improvement can be made upon our plan and are anxious to formulate an agreement mutually beneficial to manufacturers and dealers."

One from Indiana says: "We have always believed the rebate system to be a good thing for the manufacturers and jobbers, and we are in favor of any satisfactory system which you may devise."

One from Illinois says: "We appreciate the value of the cooperation of the wholesale grocery trade, and no effort on our part will be spared to make them a medium through which to supply the retailers with our specialty products."

One from New York says: "We hold that the master key to the situation is found in the hands of the manufacturer, and in his alone, because he acts clearly within his constitutional rights, when he chooses his customers and when he elects not to sell his product to price cutters. The legality of his act can not be successfully assailed from any quarter."

One from Pittsburg says: "We are very much pleased to see this movement. We have been advocates of the rebate system for many years."

One from Ohio says: "We beg to advise the committee through you that we are in hearty sympathy with every effort of the wholesale grocers in their attempt to devise a system which will enable them to sell our products and other staple specialties at a price that will offer them a legitimate profit, and will gladly cooperate with them in a movement in this direction to the extent of our ability."

As a result of our study of the situation, we have decided to submit as follows:

We hereby fully indorse the plan for selling sugar, known as the factor and equity system, as it was managed in the early years of the movement, when rebate checks were not sent until affidavits had been received. With this requirement restored, we doubt if the plan could be greatly improved upon.

For handling other articles, we have selected and formulated three plans, giving our first preference to No. 1, our second to No. 2, and our third to No. 3.

When at all possible, we believe that the equity system should be introduced (our secretary will explain this to those not familiar with it), and where this can not be done, the country should be divided into sections and different prices made to equalize the freight rates, as is now done by some of our largest manufacturers. We believe that either system proposed will work to the benefit of all concerned, if strictly enforced by the manufacturers, but not otherwise, and we again repeat what was said in the preamble and resolutions passed at Niagara, i. e.:

"That any halfway measures that hold the honorable merchant, but does not control the man who seeks to obtain an advantage over his competitors by dishonorable means, are far worse than none and should not be tolerated for a moment."

We respectfully ask all manufacturers to give this communication careful and thoughtful consideration, and if they have not yet adopted a rebate system to adopt one of the three submitted, or if these do not have their full approval to adopt one of their own that will accomplish the same results; and we also ask all wholesale grocers whom we represent, and in whose interest we are working, to

cooperate with us in putting an end, so far as possible, to the ruinous and destructive work of the cutter.

We recommend to all associations the passage of resolutions offering a large reward for the detection and exposure of anyone who willfully cuts the price of any limited article.

Respectfully submitted.

G. WALDO SMITH, *New York,*
W. J. SEAVER, *Boston, Mass.,*
J. F. GRINSTED, *Louisville, Ky.,*
HORACE C. BREWSTER, *Rochester, N. Y.,*
F. W. HANNAHS, *Newark, N. J.,*
Committee.

[FORM No. 1.—Contract governing sale of John Doe & Co.'s goods.]

First. We promise and agree not to sell, or cause to be sold for less than the card rates now in force, the different brands and grades of soap manufactured by John Doe & Co., directly or indirectly, either by rebates, commissions, payment of freight, allowing a greater discount for spot cash than 1 per cent, selling the said goods on longer time than thirty days, allowing anyone not solely and entirely in our employ a commission or allowance of any kind for turning orders for said goods over to us to be filled, or otherwise.

Second. Should any change be made by John Doe & Co. in the price of any of their brands, we agree to conform to the new price immediately upon receipt of the advice of the change.

Third. We further agree that when requested by John Doe & Co. we will refuse to sell at any price, loan, or exchange for other goods, goods of their manufacture to any dealer who has or has not signed an agreement similar to this who is selling or has sold their goods for less than their established card or profitable rates.

Fourth. We further agree that when a charge of violating this contract shall be made against us, and we are asked by John Doe & Co. for the name of the person who made the sale in question, we will give them the name and such other particulars as they may desire. Refusal on our part shall be conclusive evidence against us that the charge is true, and we will then pay \$50 to John Doe & Co.

Fifth. We also agree that when anyone in our employ is accused of violating this contract, and such employee shall be requested by John Doe & Co. to make an affidavit under oath or affirmation denying the accusation against him, refusal on his part to make such affidavit shall be conclusive evidence against him that the charge is true, and we will then pay \$50 to John Doe & Co.

Sixth. John Doe & Co. agree to pay the \$50 collected under the fourth and fifth clauses of this contract to the parties making or furnishing proof of any such charges.

Seventh. John Doe & Co. further agree not to furnish their goods to any firm who has sold or whose salesmen have sold goods of their brand for less than the established price until the fine of \$50 is paid, either by the house or by the salesman who made the sale.

This agreement is to take effect on and after ———, 189 .

(Sign here)

JOHN DOE & Co.

Please date, sign, and return, as no orders will have attention until this agreement has been entered into.

[FORM No. 2.—Agreement regulating the sale of goods manufactured by John Doe & Co.]

We, the undersigned, hereby promise and agree with John Doe & Co. that we will not sell, nor will we allow our employees or agents to sell, either directly or indirectly, any goods under the "Hobson" brand for less than the prices established by them for said goods, or upon other terms or conditions than herein given.

Should any change be made by John Doe & Co. in the prices of their brand of goods, we agree to conform to the new price immediately upon receipt of advice of the change.

We also agree that under no circumstances will we give longer time than thirty days, and no greater discount than 1 per cent for cash if paid within ten days after delivery of the goods.

We further expressly agree, that in the event of it being charged that a sale or sales have been made by ourselves, employees, or agents, at prices or terms that do not conform strictly with this contract, both in spirit and in fact, we will for-

feit and waive all our right to and interest in any trade discounts that may be due us, unless we can prove the charge untrue to the satisfaction of John Doe & Co.

_____, 189

(Signed)

[FORM No. 3.—Notice to jobbers.]

On and after May 1, 1898, our "Dewey" soap will be sold as follows:

A uniform price of \$4 per case will be charged to all buyers in any quantity sold. To jobbing grocers who purchase 100 case lots, and who do not sell the same for less than the purchase price, and who sign and remit affidavit at the end of each month that they have in good faith maintained the selling price, we propose to remit on the 10th of each month a sum equal to 40 cents per case for all goods bought during the previous month.

If any complaint is received that the buyer has cut the price in any way, we will withhold the rebate until satisfactory proof is furnished that the charge is not true; and if proved true to our satisfaction, we will withhold it altogether.

We reserve the right to discontinue all rebates at any time without notice, and desire to have it distinctly understood that the above proposition is in no sense an agreement on our part, but simply an effort to interest the jobbers in the sale of our goods and to see that they are paid for any service they perform for us in the distribution of our product.

_____, 189

(Signed)

CERTIFICATE.

We hereby certify that we have not, nor to the best of our knowledge and belief has any member, salesman, or any person employed by us, or connected with us, sold any soap made by John Doe & Co. at a price less than the price adopted by said John Doe & Co. as their schedule price, or accepted any diminished price, either directly or indirectly by means of device, or return rebate, commission, discount, allowance, or otherwise, nor made nor had with any person any promise, agreement, or understanding, expressed or implied, whereby such diminished price would be in fact accepted or received by us, either directly or indirectly.

Dated, _____, 189 .

AFFIDAVIT.

State of _____, county of _____

_____, being duly sworn, deposes and says that he is a member of the firm of _____, and that he has not, nor has the firm of which he is a member, sold, nor have they permitted their representatives or employees to sell, nor have they, after a full and thorough investigation of all their transactions, sold John Doe's flour to _____ below the card or contract price in force on and since the aforesaid date, either directly or indirectly, by payment of freights; by rebates, in cash or in any other manner; by drawbacks; by gift, gifts, or promise of such; by payment of commissions or brokerage, either to the purchaser or to persons not solely and regularly in the employ of his firm; nor under pretense of paying lost bets; by allowing a greater discount than 2 per cent for spot cash, or by selling John Doe's flour on longer time than sixty days; by the sale of other goods at less than the usual price, or the purchase of other goods at more than the ordinary price, having an understanding with the interested parties, express or implied, that such was done in order to sell John Doe's flour for less than the card or contract price; to sell a certain quantity at the price for that quantity and make more than one delivery of the lot, or to divide the payments so as to make it equivalent to more than one delivery of the lot; by the sale of a certain quantity of John Doe's flour at the price for that quantity with the knowledge that a division of the lot was to be made between two or more buyers, to enable each to procure the said flour for less than the contract or list price for the quantity each would receive; by having an understanding with his said firm, or with any of its employees, to bill a less quantity of goods than actually shipped, or to bill other brands of flour at a lower price than John Doe's flour, supplying said John Doe's brands in lieu of those so billed, or in any other manner. That he is not now, nor is his said firm, or any of its employees, under promise or obligation to, nor have they an understanding with any person or persons, to do any of the above acts whereby the price on sales already made would be reduced below the card price in force at this time and since the aforesaid date; and that he makes this affidavit without any mental reservations whatsoever.

Sworn to before me this _____ day of _____, in the year 189 .

[Office of New York State Wholesale Grocers' Association, 6 Harrison street, New York.]

NEW YORK, October 3, 1898.

GENTLEMEN: In a letter of recent date we stated that we had prepared a circular letter and three formulas for a limited price or factor system, and sent copies to all manufacturers of goods of the kind susceptible to being handled in that manner, with the request that they adopt one of the three systems, or some modification of them that would accomplish the same results. This marks a new era in the trade; for while for many years there has been a general and oft-expressed demand on the part of the wholesale grocers for the adoption of some system of the kind, yet no definite plan has ever been formulated and submitted, and while many manufacturers have adopted a plan of their own, yet it has usually been without concert with their customers, the wholesale grocers, and no two plans have been alike. While some have been reasonably successful, others have failed to accomplish the desired end, and some have been worse than none, as they held the honorable, covenant-keeping merchant to a fixed price, while permitting the cutter to obtain an unfair and dishonorable advantage over his competitors in trade.

The three plans submitted have the unanimous indorsement of representatives from thirty-four States, and all the numerous letters received from various sections of the country give their approval of them and express an earnest desire for their adoption by all manufacturers.

Some doubt or question has been raised as to their legality in some States. The inclosed copy of an editorial found in the Journal of Commerce and Commercial Bulletin, under date of August 26, 1898, shows conclusively that manufacturers have a right to adopt terms of sale.

You will observe that neither of the formulas has any relation whatever to an association, neither are they contracts between any two buyers.

No. 1 is the form used by Proctor & Gamble, and was prepared and used by them long before any wholesale grocers' associations were organized, and has worked admirably.

No. 2 is the form used by another large manufacturer, with some slight modifications. They are both simply contracts between buyer and seller.

No. 3 provides for no contract whatever. The seller simply agrees with himself, by himself, and for himself that if the buyer does not sell the goods for less than he pays for them (men calling themselves merchants have sometimes done so), that he will reward him for the service performed for him in helping to place his goods in the hands of the retailer. Any law that would deny this privilege to the seller would deny the right of contract, and would unquestionably be unconstitutional.

The system is not only legal, but is also fair, reasonable, and right, as we have divine authority for saying that "the laborer is worthy of his hire."

Some letters received convey the impression that the writers think that your committee can secure the adoption of one of these formulas by all manufacturers at once. This is a great mistake, as while your committee is willing and anxious to do all in their power by correspondence and by personal interviews to secure the adoption of these forms by all manufacturers, you must remember that they are men whose interests are no greater than yours, and can not be expected to give all their time working for the good of the trade in general.

If any material improvement is secured, it must be the result of persistent and continuous effort on the part of a very large number of wholesale grocers. If you and your buyers should keep copies of these papers before you, and when making purchases would urge the adoption of one of the formulas upon the manufacturers, they would soon come to see the advantage of complying with the wishes of their principal customers, and the ones upon whom they mainly depend to aid them in the distribution of their product.

Copies of all papers issued can be obtained from Mr. L. P. Lyon, 6 Harrison street, New York.

Hoping to have your earnest cooperation in this very important matter, we remain,

Yours, truly,

G. WALDO SMITH.
HORACE C. BREWSTER.
F. W. HANNAHS.
W. J. SEAVER.

[New York State Wholesale Grocers' Association. Office, 6 Harrison street, New York City.]

NEW YORK, October 27, 1898.

GENTLEMEN: In the numerous letters received from manufacturers in reference to our circular letter sent out over the signatures of a committee appointed at the convention of wholesale grocers held at Niagara Falls in June last, several have expressed doubt as to the legality of the forms submitted. This is a matter that has received careful attention at the hands of the committee, eminent counsel have been consulted, and the conclusion reached that either the factor system, now in use by some of the largest manufacturers in the country, or the limited price system, as per forms Nos. 1, 2, and 3, as per inclosed copies, are unquestionably legal and can not be successfully attacked by the laws of any State in the Union.

The inclosed clipping from the Journal of Commerce, under date of August 26, very nearly expresses the views of the committee.

You will observe that neither of the formulas has any relation whatever to an association; neither are they contracts between any two buyers.

No. 1 is the form used by Proctor & Gamble, and was prepared and used by them long before any wholesale grocers' associations were organized, and has worked admirably.

No. 2 is the form used by another large manufacturer, with some slight modifications. They are both simply contracts between buyer and seller.

No. 3 provides for no contract whatever; the seller simply agrees with himself, by himself, and for himself that if the buyer does not sell the goods for less than he pays for them (men calling themselves merchants have sometimes done so), that he will reward him for the service performed for him in helping to place his goods in the hands of the retailer. Any law that would deny this privilege to the seller would deny the right of contract, and would unquestionably be unconstitutional.

The plans submitted work automatically and do not at any place require the assistance of the courts, but depend for their working upon the penalty which the seller can enforce without the assistance of constituted authority.

The factor system is simply terms of sale adopted by the seller and accepted by the buyer.

This system was fully explained by the chairman of this committee and others to the Lexow trust investigating commission, and it was found not only that there was no law on the statute books that could reach it, but that any law that could be passed that would deny the manufacturer the right to make his own terms with the buyer would also deny the privilege of making a contract for the sale of a house or a horse.

It was claimed before the committee that the factor system was not only legal, but that it was fair, reasonable, and right, and the claim has never been questioned to the knowledge of the undersigned.

We again respectfully call your attention to the papers inclosed and to the views therein expressed, and if you have not already adopted a system, it is hoped that you will give the matter the consideration which we believe it deserves at your hands.

Yours, very truly,

G. WALDO SMITH, *Chairman.*
HORACE C. BREWSTER.
F. W. HANNAHS.
W. J. SEAVER.

Q. Are there any other manufacturers of soap with whom you have similar terms of sale?—A. Yes.

Q. (By Senator MALLORY.) In the event that this soap, that you get from Babbitt, were not sold at the price agreed upon with the manufacturer, what would the result be?—A. The fact is that not half of it is sold at that price and there is no result; they take off 25 cents just the same; it is not enforced. I have been at their office for the last 2 years, once a month, and tried to get them to enforce it but I cannot; they will not give it any consideration.

Q. (By Mr. JENKS.) Still they will give you the 25 cents off?—A. They will bill it at 25 cents more than they propose to get and we get the chance to make it.

Q. Are there any other manufacturers that make a similar agreement and insist upon it?—A. Proctor and Gamble are the original factor system men. They invented it and put it in force 10 years before there was any wholesale grocers' association, and it is the most carefully and religiously kept of any rebate system to-day.

Q. They are keeping it up rigidly?—A. Oh, yes, they are holding them up to it, and if they could find a man anywhere in the United States selling 5 cents less than the agreement, he would be fined \$50 forfeit, which would be paid to some charitable institution, while he would not be sold any more soap. That is one rebate system that is faithfully kept.

Q. Can you give us a copy of that?—A. No.

Q. Do you buy your soap from them?—A. We buy from their agent in New York. I will try to get one; I do not know whether I can or not.

Q. Do the different soap manufacturers, Proctor & Gamble, Babbitt, etc., sell under agreement with reference to this system at all?—A. No, they have no agreement; they have simply adopted these terms of sale.

Q. Well, have they adopted them in unison or has each company acted for itself?—A. Each company for itself.

Q. How is it with reference to the baking powder companies?—A. They are all consolidated; but before the consolidation, the Davis Baking Powder Company and the Cleveland Baking Powder Company gave us 10 per cent rebate. There was a statement required, I think, but not an affidavit. The Cleveland Company gave us 6 per cent rebate. Now, I think, they are all consolidated. I do not know whether the Davis is in or not. That is an alum baking powder; I do not think it is.

Q. Do you think the agreement is now uniform for most of the baking powder companies?—A. I do not know that the new corporation has adopted any system, but have been told by their agent that we would still get our 5 per cent.

Q. (By Senator MALLORY.) You say there was no agreement or understanding between the manufacturers of soap and yourselves in regard to maintaining the prices. Is it a fact that the soap was sold at different prices by wholesale grocers?—A. Yes.

Q. According to their agreement with different manufacturers?—A. No; according to their own desire to get trade. If you will allow me to explain—

Q. (Interrupting.) I should like to hear it.—A. I will take a brand of milk as an illustration. There was a brand of milk put on the market 3 or 4 years ago at \$3.50 in carload lots. We undertook to get \$3.75, which would afford us 25 cents profit, which is about 6 per cent, and less than the cost of doing the business. It was not more than a month before our salesmen came in and said, "That brand of milk is being sold at \$3.65." And in another month they came and told us it was \$3.60, and in less than 3 months that milk was being sold for just what it cost us. The only remedy was to ask the manufacturers to put a rebate on that milk; the only way to remedy that method of selling goods is to see that we are paid for the goods. I think I said that the one-hundredth man can cut a price and fix a price for the 99. The only way a manufacturer can interest us in selling his goods is by seeing that we are paid for it. If we purchase of you, and the New York man cuts, you can help us by making a fixed, definite price, with a rebate, and by giving the rebate only to those who maintain the price. Now, if that system was carefully, religiously, and honestly carried out it would enable the wholesale grocer to get a reasonable profit.

Q. And what would the advantage of the manufacturer be?—A. That we would be interested in selling his goods. Our salesmen are mostly salesmen on commission and they will not push goods in which there is no profit; they will say, "We do not like soaps that do not pay or milks that do not pay." There is no reason in our handling goods that do not pay. The only reason that we gave to the American Sugar Refining Company 8 years ago was this: The wholesale grocers of America are handling one-third to one-half their goods at net cost, and there are going to be enormous failures in the trade unless we get a profit for handling sugar. It was the general condition. These goods represented from 25 to 30 per cent of the business. We said to them, "You have got enormous accounts receivable with the wholesale grocers. If you can not put them in the way to make a profit, you are going to lose your accounts receivable; if you will help them, you will get the accounts." That was the only reason presented to Mr. Havemeyer, Mr. Searles, and Mr. Theodore Havemeyer.

NOT MUCH PROFIT FOR WHOLESALE GROCERS IN SUGAR.

Q. Does this 18½ cents a hundred afford you a fair profit?—A. No; it does not. It is a very difficult thing to decide. It is about 5 per cent. The cost of doing business is always more than that. It is 6, or 6½ to 7 per cent in New York. It is not less than 6 and is frequently over 7. My business cost me 7 last year.

Q. So that substantially the wholesale grocers are handling sugar at a loss?—It is difficult to decide whether or not it is an actual loss. They say you handle sugar at a loss. It comes in barrels and is delivered on the sidewalks. It is

easier to handle than similar goods and perhaps in that way does not actually cost more than we get. We are all glad to sell it, but certainly it is difficult to tell and no one can determine. I can not determine and I have figured on it with the biggest and best wholesale grocers in New York. I have talked that over with my clerks, "Do we make a cent on sugar or not?" I have not decided that; I can not tell; I do not believe any human being can settle that sugar question fully and determine whether or not sugar at 18½ cents is a loss. Of course it depends on the length of deliveries and the average loss on bad debts. Our loss averages one-half of 1 per cent on bad debts. You take a wholesale grocer in a town like Albany, a place with short deliveries and short trips to the depot, and he makes some money probably, but in the case of the New York jobber it is doubtful if he makes anything.

Q. You have handled sugar as a wholesale grocer for a good many years?—A. For 25 years.

Q. Do you think there was more profit in handling sugar before the American Sugar Refining Company controlled a very large part of the output?—A. No, there was not.

Q. Was there earlier?—A. Never in my life, in the 24 years I have been doing business, have I made any profit until we got that rebate. I might on soft sugars but not on the hard. Any goods that are not of uniform quality always afford a minimum of profit. Soft sugar is of an indefinite quality; one may be worth 4½ and one may be worth 4¼. But granulated is always of a fixed, definite value, and if we buy at 4 cents we can not sell it for more; everybody knows who buys it what we are making. It is just the same with a box of soap. We have handled the Royal baking powder as long as I can remember. Our limit was a \$300 purchase. We could handle a \$300 purchase and not get \$300 and 1 cent for it. I have been working with them for years and finally they gave us the rebate.

Q. But the combination in the refining business was an advantage to you as long as you held to the rebate system?—A. Unquestionably.

Q. And since that time it has been a matter of neither advantage nor disadvantage; it has been immaterial whether you had it or not?—A. Except this. There is more or less cutting going on and I have never seen a day since Arbuckle and Doscher came in that I expected there would be any system 2 weeks ahead. It is quite to my surprise that it has been kept up, and it is very honorable of the merchants who have kept up the price. There are a few that cut.

Q. Do Doscher and Arbuckle give the same price, the same terms, and rebates?—A. I have seen copies of the agreement and terms of sale and they furnish the rebates exactly the same.

WHERE WHOLESALE GROCERS MAKE PROFITS.

Q. On what lines of goods are the wholesale grocers able to make reasonable, living profits?—A. Spices, teas, and coffees. Coffees have been very much cut by the competition between Arbuckle and Havemeyer, i. e., the package coffees. In the South and West coffee is almost as bad as sugar. In New York they will not use the package coffees; they claim they are not as good. As I said before all goods that vary in quality afford a small margin of profit.

Q. Why is that?—A. Because they have not a definite, fixed price. My agent says my 18-cent coffee is better than Jones's 18-cent coffee. If the customer says your coffee and Jones's are exactly the same, we can not charge any more. If they are not the same thing, I am able to charge more. Wherever articles vary in quality there is always a reasonable margin of profit. Wherever they are absolutely uniform, we can not get a profit unless we can get the manufacturers to give us a rebate.

Q. As regards these goods that vary in quality, are not your methods of purchasing them substantially the same as where there is no variation, or pretty nearly so?—A. We purchase them where we can—in the best market and at the best prices we can make.

Q. Does not the rebate system apply to these?—A. You can not fix a rebate on anything unless there is uniformity of quality and packing. If there are just 100 cakes of soap of just the same size, of the same quality, and in the same kind of a box, then you can get a rebate. If there are different sizes or qualities of soap and different sized packages, then you can not get a rebate; it is difficult.

ORIGINAL ADVOCATE OF THE REBATE SYSTEM.

Q. (By Mr. PHILLIPS.) Perhaps you can make a statement to the commission of your own motion. If you have any information that would be of benefit to the commission we should be pleased to hear it.—A. Well, I am the original advocate, as a wholesale grocer, of the rebate system—where it is absolutely uniform

and does not involve a contract between the grocers. I believe it is honorable, legal, right, and strictly in accordance with fair dealing and the spirit of the golden rule of doing to others as we would be done by. Now, I believe that any system of doing business that compels the manufacturer, the merchant, or the transportation company to perform a public service without a reasonable and adequate compensation is opposed to a wise public policy and the best interests of all the people. It is right and reasonable that every merchant should get a reasonable remuneration for what he does and the moment he gets more than a reasonable remuneration, competition is certainly going to come in and cut down the price. The only way that a so-called trust can be maintained is by being reasonable, and if they are reasonable, all interests are served, and the greater the magnitude of the concerns the better it is for the people. I do not own a dollar's worth of stock in any so-called combination or trust, and I can not in fact hear of a great corporation or a trust.

NO SUCH THING AS A TRUST.

There is no such thing as a trust to-day. I asked 14 lawyers in 14 States if they knew of a trust, and they could not name one. I went to Albany the other day and I used the New York Central Railroad. I was making an address not long ago and I wanted to use the New York Central Railroad as a type. I went over there to find out how many owners there were of that railroad, and I found there were 12,015. I wanted to go up to Albany, and they took me up there in 2 hours and 40 minutes, and brought me back again in the same time. That road having a great combined capital of \$200,000,000 and 12,015 owners performed me a great service. The Pennsylvania Railroad, which I used to-day, did me a great service. Now, I say, that iron and all such industries can be carried on more successfully, more reasonably, and more cheaply by a great corporation. I happened to come across in the paper to-day a statement which I knew to be a fact before. George M. Warner, a delegate of the International Machinists' Union, reported yesterday that there was a great demand for machinists everywhere, and that some employers could not find enough men. That is true all over the country. Employment was never so general, so universal, as it is to-day. Of course, there are a few great corporations, but there are positions for everybody who wants them. Will you allow me to make another statement?

THE WANTS OF THE PEOPLE ARE INCREASING.

Q. (By Mr. PHILLIPS.) Yes.—A. I had a slight interest, which I sold, in an Ohio steel concern. I used to be familiar with that business. I went in there a few years ago and the first thing I noticed was the absence of men. Everything was done by electricity. Work that required 50 men to perform formerly is now done by machinery. I said to the president, "Where are all the men?" "We do not employ them any more." "What has become of them?" He replied, "I do not know; they are all employed." Employment was never so general as it is now. The fact is, the cheapness of everything has increased the wants of the people. That is the only solution I can find. Another fact: I am a Methodist, and go to the Methodist Church. I was looking down over the rail the other day and I saw that the whole congregation had \$4, \$5, \$6, and \$7 umbrellas; 40 years ago they would have had 50-cent cotton umbrellas; and I noticed that the umbrellas had silver and pearl handles, etc., and they were all poor people, too. There was not a man in that church worth more than \$20,000. That shows that the people's wants are increasing.

ONE CAUSE OF THE PANIC OF 1893.

Q. Is not the great plenty at present brought about largely by the panic of 1893? Were not the works shut down then and manufacturing stopped so that everything became scarce?—A. One of the most potent factors leading to the panic of 1893 was the fact that the transportation companies had worked for nothing. Three billion six hundred million dollars of stocks were not remunerative and the people who had been depending on dividends on them for buying houses, horses and carriages, ribbons, shoes, and all the necessities of life lost their incomes. The demands of the people were lessened in consequence of the fearful fight of the transportation companies. That was one of the most potent factors, in my judgment, leading to the hard times of 1893, the fact that the transportation companies had failed to pay dividends. The moment they began to make dividends again, the ribbons and shoes and trinkets and all those

things were wanted, building up trade and starting business, and that has made this great boom of 1899. Dividends are being made. The great trouble is that the stocks of these corporations have been put on the market at inflated prices and the public do not know what they are buying and are going to get fearfully hurt when bad times come again.

Q. Do you, then, apprehend an overproduction in the near future?—A. Not in 2 or 3 years, I should suppose, although I am not a prophet; but I do think the time will come when there will be an overproduction and these great corporations which are overcapitalized will not be able to pay dividends on their stock. That will reduce the earning capacity and the buying capacity of all the people.

Q. (By Mr. JENKS.) Do you look upon overcapitalization as a decided evil?—A. Yes; that is a very serious evil, but it would not be an evil if the original owners of the stock of the great corporation still continued to be owners, but instead of that the public comes in and buys it out, and while they may make dividends for a few years on the overcapitalization, they will get left in time.

LEGISLATIVE REMEDIES NOT APPROVED.

Q. Can you make any suggestion as to legislation that will check that tendency?—A. Mr. Lexow asked me if I did not think the price of wheat, corn, and rye should be fixed by law. I answered that until the legislature of the State of New York controlled the rain, the heat, the sunshine, the movements of the atmosphere, and the production of crops, it could not control the prices of commodities, or anything that nature produces independently. It is absolutely impossible. I think the more the legislature and the people let these things alone the better they will work out their own solution; the moment they do anything unreasonable they will be checked. The moment they crowd or overcharge anybody there will be a reaction. Look at the nail trust. A few years ago they put nails up to an unreasonable price. What was the result? A new man came in and put up factories and reduced the price. The law of supply and demand is inexorable; you can not get away from it. Let me make another statement. The antagonism of labor and capital is the most unfortunate thing for labor that can possibly be conceived of. Their interests are identical and uniform. When this building was built, the first man that received the benefit was the man that dug the cellar, and the next man to receive the benefit was the architect's clerk that drew the plan. Then for a year labor took in profit from the capitalist, and from the time the building was finished there have been caretakers here who have been benefited all the time. You take the railroads. Labor is benefited by the building of a railroad from the time it is begun all the way through and after it is finished. The railroads support millions of people; they require caretakers and operatives; everybody connected with them is benefited. The capitalist may be benefited or he may not; but the laborer is sure to be benefited. This antagonism is very unfortunate; it is dangerous and against the best interests of all the people.

Q. (By Mr. PHILLIPS.) Do you think the new industrialists have put too high a price on their manufactured materials? Does not this still apply to the tin-plate and steel combinations and the various other combinations?—A. I have no definite knowledge. I do have definite knowledge in regard to one matter, but that is all I know of. I do know of one concern that was formed on a basis of 275 per cent value, but that is the only definite knowledge I have.

RELATIONS OF LABOR AND CAPITAL.

Q. (By Mr. KENNEDY.) Do you think that labor is ever unreasonably antagonistic to capital?—I do; but all I know is from reading.

Q. You can not say anything specific about it?—A. No; all I know is from reading. I have known of cases, of my own knowledge, where strikes have been very disastrous.

Q. Is it not always where labor believes it has a grievance and is not getting its proper share of the values created that there is trouble?—A. I believe that labor is honest in its opinion and thinks it is done a great injustice; but the laborer to-day gets about two and one-half times as much in food, shelter, and clothing as he got 30 years ago.

Q. What would you say, for instance, with regard to the laborer who works 10 hours a day for a railroad company in the track work and gets from 50 cents to \$1 a day?—A. I never heard of such a thing.

Q. There is labor of that kind all over the country.—A. Not in the East, is there?

Yes; track labor does not receive more than \$1.25 in any part of the country, and it gets as low as 50 cents.—A. I did not know that; I have no definite knowledge of that subject. I know I used to hire men in my business for half I pay now, and everything was a third dearer.

COMPETITION THE REMEDY FOR THE EVILS OF COMBINATION.

Q. (By Mr. FARQUHAR.) Do you think it is possible for any combination of capital, however large and however well managed, to maintain a monopoly and keep prices up for any length of time?—A. They will bring down ruin on their own heads very quickly, the same as the nail concern did, and the same as they all have.

Q. Do you believe that there is enough capital in the United States to handle three times the amount of business the trusts have to-day and that new capital would come in if it saw an opportunity for profit?—A. New capital is always ready to come in if there is a profit.

Q. Do you believe that under present conditions there is capital ready to take a hand in production if there is any reasonable prospect of profitable investment?—A. Yes; for instance, these other sugar companies that have been bought up by Havemeyer. My argument is that millions stand ready to come in if there is any opening. My study of the sugar question is that the whole work of the American Sugar Refining Company, while they have made it pay, has been beneficial. They have reduced the price of sugar to every consumer in America. Their margin of profit is reasonable; it has never been excessive. I used to know more about it than I do now; I have not followed the margin lately, but it has never been excessive; and buying such enormous quantities they can control the market, in the interest of cheap sugar.

Q. Is the cheapening of the price of sugar due to foreign legislation? Have the advantages in respect to sugar been more the result of foreign legislation than anything else?—A. You know the tariff legislation does not let in refined sugar. Under the Wilson bill they could not compete with one-eighth of a cent margin on refined sugar, and it was difficult to make more than one-half of a cent margin. Under the new bill refined sugar is practically shut out, as I understand it.

Q. Your statement here is that you do not think there are any inordinate profits going to the American Sugar Refining Company?—A. There could not be any inordinate profits, and now they are making no profits. It is only a question now of the survival of the fittest among the refiners; the fittest will survive and the rest will go down. You will find that Mr. Havemeyer will tell you, when he gets here, that they are making no money and that nobody else is.

Q. In your business, as a wholesale grocer, have you ever found any difficulty on account of discrimination in rates on the railroads?—A. Our business is local. There used to be difficulties of that kind. We do not have much outside business. Austin, Nichols & Leggett have more than we have. I have not heard any complaint of that kind lately, and I think that has been entirely overcome. The railroad rates are so low now there is no occasion for complaint. Edward Atkinson said it used to cost \$3.50 to move a barrel of flour 1,000 miles, while now you can move it for 25 cents. If you do not believe it, take a wheelbarrow and go ahead.

Q. (By Mr. FARQUHAR.) Did you state that all of the baking powders were under the control of one concern?—A. I think all the cream-of-tartar powders are. Whether the Davis is in it (the alum baking powders) I do not know, but all the cream-of-tartar baking powders are in one concern, with \$20,000,000 capital.

Q. Have you any means of telling the commission how much that has cheapened the product to the consumer?—A. No; they have a close corporation and have done an enormous amount of advertising and have got practically a monopoly through their advertisements. If such a thing as a monopoly can exist, it is in that. It is a good deal like a patent medicine—there is a margin there. That is the result of advertising in combination. They have made people believe it was the only baking powder fit to use by extensive, persistent, and continuous advertising. That is legitimate. Others have tried it and failed.

Q. Does not the advertising of all these products lay entirely with the producers of them; that is, the wholesale grocers or the factors between the consumers and the manufacturers, pay very little for advertising now?—A. They advertise scarcely at all; the manufacturers advertise their own products and place them.

Q. They advertise the quality of their wares without designation of the parties selling them?—A. Yes; it is the same with all grocers; the retail grocers come to us.

Q. Do you think that the overcapitalization of these great corporations or combines, as they are called, will ultimately lead to the same condition as the limited companies did in England, that the general public will be caught in an era of speculation which will ultimately result in loss; that it will be stock jobbing from beginning to end?—A. That is entering upon the realm of prophecy.

Q. Well, what is your opinion as a business man?—A. I think it is the rule that we have times of inflation; and I think that in the course of time we will have a reaction from this movement in some form or another.

Q. Is it your opinion that half the companies now being organized are stock-jobbing companies, and have nothing to do with cheaper rates to the consumer?—A. I think most of them have been formed of necessity to meet competition and to reduce the cost incidentally. Most of them have made money on their stock, but still I think the object was to reduce the cost. When the American Sugar Refining Company was first formed there were 7 refineries that had offices in Wall street next to each other, and if our broker went down there to buy sugar A would perhaps undersell B at less than cost. Mr. Frazer, of Philadelphia, of Harrison & Frazer, one of the largest manufacturers, said to me 8 years ago, "Until the formation of the trust we had not sold a barrel of sugar in years that we did not lose money on. Just as soon as that was formed we followed their price, and now we are making a profit." Mr. Frazer told me that in the presence of several other wholesale grocers in Philadelphia. That is what it is going to be now; it is a question of the survival of the fittest. Somebody has got to go. Who is going I am not able to say; but it is going to be ruin. It is a fight to the bitter finish. Somebody has got to die, that is all; there is no help for it. It is very unfortunate that these refiners got into line. It is a great misfortune. This is my opinion, as I said before. I have no information of any name or nature.

COMBINATIONS DO NOT PERMANENTLY DESTROY COMPETITION.

Q. (By Senator MALLORY.) Is it your opinion that combinations of capital, or corporations, for the purpose of controlling the production of any particular article do not destroy competition?—A. They may temporarily until the fact is developed that there is a margin of profit to be got by somebody, and immediately somebody makes an investment and cuts the price.

Q. That is the point of my question. You believe that they will not destroy it permanently, but only temporarily?—A. They will not destroy it for any length of time. The only exception to that would be some article like patent medicines—some highly advertised article, of which the people will not have anything else.

Q. Do you know anything of the workings of the Standard Oil Company?—A. Nothing, except what I have read in the newspapers. I have no knowledge of any name or nature. I only know this fact, that I used to buy oil at \$1.25 a gallon and sell it at \$1.50, and that I could not get as much as I could sell. Now, I can buy 4 gallons for what I used to make on 1. Who has done that I can not say.

Q. So far as refined oil is concerned, that is very much cheaper now than before the organization known as the Standard Oil Company; but the point I want to get at is whether any combination—I will not take the Standard Oil Company as an illustration, because I may be doing them an injustice—for the purpose of controlling any particular product can be so powerful as to limit and crush out all possible competition. Your general proposition is that no matter how large a combination may be, it will not prevent competition as long as competition will pay. Now, is it possible for the combination to be so large that it can crush out all possible effort to compete with it?—A. Yes; that may be true; and it is certainly true that great aggregations of capital, that can command the very best brain power in the world, can undersell inferior aggregations of capital and inferior brain power; and that is all right. That, of course, can be done and should be done; it is legitimate and right; the best interests of the people are subserved by it; it should be understood that a reduction of 1 cent on oil is a saving and a reduction of \$2,000,000 a year to the people of the United States. I used to sell it at \$1.50.

Q. (By Mr. PHILLIPS.) You do not attribute that to the fact that it was monopolized?—A. No; the reduction is the result of handling.

Q. New discoveries?—A. New discoveries.

Q. New methods and the brains that have been brought to bear upon them?—A. Yes; largely the new methods of handling. It is the great aggregations of capital that use the force of gravity to bring it here instead of cars, and the ability that has been brought to bear upon it that has reduced the cost of transportation and distribution.

Q. (By Mr. PHILLIPS.) Will it be possible in the case of some of the new combinations that have been formed lately, such as those in the iron and steel trade and the tin-plate industry, where they have an aggregate capital of \$25,000,000 to \$50,000,000 and are generally supposed to be making very large profits at the present time, will it be possible to induce capital to come in and compete? Will it not be very difficult to get large capital to venture in and compete with such an aggregation of capital or such a combination?—A. I had a slight interest in a steel factory in Ohio, and the moment that was sold by the original owners they immediately formed another company and commenced building new factories. There is one thing I am quite familiar with. I have been in Mexico and seen them mill corn. They grind 2 hours to grind enough for supper. I have been in Egypt, and everybody in those countries grinds his own flour when he needs it. I used to live on a farm, and the best part of my life was going to the mill. I used to ride to the mill and spend a day there. I used to go in the morning and stay all day and have 10 cents for my lunch, and have a good time. That was the old way. Now, Mr. Pillsbury, with his great aggregation of capital, grinds a barrel of flour for 20 cents. I have seen them work 2 hours in Mexico, Egypt, and Asiatic countries to get flour enough to make bread for supper or a day's supply for the family. They grind the wheat by pounding it with a stone. Now the great aggregations of capital do it for almost nothing, and they are satisfied if they can get a profit of 2½ cents on each barrel of flour. That is one of the advantages in great capitalization. The New England artisan could not live if we had to transport flour at the old prices.

Q. (By Mr. RATCHFORD.) Is it your opinion that without this large capitalization those old methods would still continue?—A. No.

Q. Then why state that as an illustration?—A. No; I say we never go back; nothing ever moves backward in this world.

Q. (By Mr. KENNEDY.) Do you believe that the movement that is now going on in the industrial world will end in one combination in each particular industry, controlling that industry?—A. That is in the region of prophecy again, and I am not a prophet. I can hardly conceive it possible, except in baking powder and such things, where they are advertised and popularized in the public mind. They can not do it in iron and steel; it is too widely spread, too easily found.

Q. They can in the tin-plate industry at the present time?—A. I have no definite knowledge of that; I doubt it very much, although I have no knowledge. I heard Senator Vest say in the United States Senate a few years ago that before anybody could get any profit the people of the United States would have to pay \$50,000,000 in protection. I think he was mistaken. It has been proved so, has it not?

Q. If it were possible to attain a condition in which overcapitalization and all transportation favors given to certain industries were eliminated, what, in your opinion, would be the effect on these industrial depressions that occur periodically?—A. I do not know whether I can give you an intelligent answer. It would take a wiser man than I am to fathom that. I think, on general principles—indeed, I have a profound conviction—that these things can take care of themselves better than legislation can take care of them, and that they will work out their own success or their own destruction in their own legitimate way.

Testimony closed.

WASHINGTON, D. C., June 13, 1899.

TESTIMONY OF PROF. ERNEST MAS, NEW YORK CITY, N. Y.

The commission met at 11 a. m., June 13, 1899, Vice Chairman Phillips presiding. Prof. Ernest Mas, 106 Fulton street, New York City, N. Y., after being duly sworn, testified.

Q. (By Mr. JENKS.) Will you be kind enough to state your name and address to the commission?—A. Ernest Mas, 106 Fulton street, New York.

Q. What is your business?—A. I am consulting chemical engineer of the Glucose Sugar Refining Company, of Chicago.

Q. What is your present relation to the Glucose Sugar Refining Company?—A. I am under a 5-year contract for the exclusive use of my services as a chemist and chemical advisor.

Q. Are you under salary of this company?—A. I am under a salary, and under monthly compensation and a commission of 1 per cent on all proceeds of the by-products turned out by the Glucose Sugar Refining Company.

Q. That is, on all by-products which they turn out you are to receive 1 per cent of the proceeds?—A. That is, on all the by-products extracted from the germ of the product of the corn.

THE MANUFACTURES OF THE GLUCOSE SUGAR REFINING COMPANY AND THEIR USES.

Q. Will you explain to us briefly the nature of the manufacture of glucose sugar from corn, and state what the chief by-products are?—A. From Indian maize or corn there are a great many products and by-products. The main product is corn flour. The second product is glucose; that is what is called sugar. Glucose sugar results from the transformation of the starch in the corn by chemical process. The next product is dextrine, the next corn oil, the next corn cake, and finally a rubber substitute which is a product of the vulcanization of corn oil.

Q. Will you kindly explain the uses to which these various products are put in ordinary manufacturing and trade?—A. I have never had anything to do with the commercial part of the enterprise. My knowledge is purely scientific and technical. Corn flour, of course, is an edible, and on account of its cheapness is used for mixing with other flours—with wheat flour.

Q. So far as you know, then, corn flour is largely used to adulterate, as you might say, wheat flour?—A. We might say as a cheapening agent.

Q. As a cheapening agent for wheat flour?—A. Yes.

Q. Is this corn flour you speak of the same as flourine?—A. Flourine is a mere proprietary name for it.

Q. But it is really the same thing?—A. Identically the same thing.

Q. If you will, please continue giving us the uses of these other by-products?—A. Starch is used for laundry purposes, as a size, and for cotton mills.

Q. This starch that you secure in the manufacture of glucose sugar is substantially the same as ordinary commercial starch used for all other purposes?—A. It is commercial corn starch. The next product, which is dextrine, is used for adhesive compounding, making mucilages and also sizes. The corn oil, which is to-day the most important by-product in the manufacture of glucose, has some legitimate uses in the manufacture of soft soap, but it is most largely used for mixing with other oils, owing to its emulsifying power. It is highly prized in Norway, where it can be mixed with cod-liver oil. It has a fine flavor, which makes it desirable for mixing with olive oil.

Q. You say it is used in Norway in the manufacture of cod-liver oil?—A. They mix it with cod-liver oil.

Q. And when it is mixed with cod-liver oil it is ordinarily sold as cod-liver oil?—A. No; I presume we get part of it again here in bottles.

Q. Labeled as cod-liver oil?—A. Very likely. It is also used, owing to its peculiar flavor, as an edible oil in competition with olive, and it is exported largely as a substitute for cottonseed oil.

Q. When it is used as an edible oil, it is used to take the place of olive oil?—A. It is used for blending with olive oil.

Q. Just for blending oil?—A. And sometimes for reducing the original cost of olive oil.

Q. What is the comparative cost of corn oil as compared with the cost of pure olive oil?—A. The high grade of olive oil can not be had in this country for less than \$1 per gallon, while the highest grade of refined corn oil made under my process sells at 4 cents a pound. It is sold for 4 cents a pound, which means about 80 cents per gallon.

Q. When this is used for blending with olive oil, where is this blending process usually carried on, in this country or abroad, or both?—A. It is carried on by exporters from the old country to the United States—exporters from Italy, France, Spain, and Prussia.

Q. That is, corn oil is sent to those countries, blended there with olive oil and is returned here as olive oil?—A. No; as a blended oil.

Q. As a blended oil?—A. It is mostly a table oil without a name, Table oil, compounded oil.

Q. Does it ordinarily, in your judgment, go on the market to the retailers as a blended oil, table oil, or does it go as olive oil?—A. It goes mostly under the name of table oil. There is no pretense of selling this mixture as pure olive oil, but as it is extremely difficult to analyze a mixture of corn oil and vegetable oils, I could not tell positively, as a chemist, whether a mixture of olive, corn, and linseed oil, for instance, exists in a given proportion; it can not be determined by qualitative or quantitative analysis.

Q. You spoke of a mixture of corn oil and linseed oil; in your judgment, is that mixture a common one?—A. When I first refined oil, some 4 years ago, for

the American Glucose Company I was rather struck by the similarity of the characteristics between the poppy oil, which is worth 80 cents per gallon in Belgium, and corn oil, and it occurred to me that by a proper refining process we could produce a corn oil in the United States so similar to the poppy oil that it might naturally take its place for painting purposes, for mixing with white zinc and white lead, and I think we have succeeded in preventing the export from the old country of poppy oil, at least to a considerable extent, simply because poppy oil is worth from 80 cents to \$1 per gallon and the same class of corn oil is sold in this country for 30 cents per gallon.

Q. As far as a mixture of corn oil and linseed oil is concerned, the similarity of the two oils is such that it is an impossibility for any chemist to determine the presence of corn oil in linseed oil, and as the price of corn oil is much lower than the price of linseed oil the two oils are frequently mixed in order to reduce the cost?—A. Yes.

Q. Under those circumstances do they go on the market regularly as blended oil?—A. It will be impossible for me to tell whether the large producers of linseed oil are making use of corn oil, but I doubt it. I believe manufacturers of linseed oil are selling pure linseed oil, but before the product reaches the consumer the two are blended with a view to reducing the cost.

Q. That is, the blending is done, then, not by manufacturers of linseed oil but by large dealers?—A. And by buyers of corn oil.

Q. And by the manufacturers of paint also?—A. Perhaps, by manufacturers of paint and putty.

Q. Is corn oil as good practically for the purpose for which it is used as the linseed oil when blended in this way?—A. It has no injurious effects on the finished product; it cheapens the cost, and is a slower drying oil than linseed oil. The main application of corn oil is in the production of substitutes for Brazilian rubber (which is exported from the banks of the Amazon) by a process of vulcanization which I have suggested to the Glucose Sugar Refining Company. Vulcanized oils are produced which can be sold for about 6 or 7 cents per pound, while the rubber from Brazil is worth \$1 per pound. Vulcanized corn oil can be mixed with pure Para rubber in any proportion. The resulting mixture is much softer, less elastic than pure rubber, but almost equally acid proof. It is largely used to-day for cheapening bicycle tires, rubber boots, and in fact, almost all articles made from rubber, the difference in price being such, from 6 to 7 cents for corn rubber to \$1 for the pure rubber article, that the mixture greatly reduces the cost of the finished product.

Q. You think yourself that the product is, on the whole, not so durable or quite so good in most particulars?—A. It is not so good; it is not so resilient. The main characteristic of rubber is its resiliency or elasticity; it is not so elastic, but I presume it is almost as acid proof as vulcanized rubber is.

Q. You yourself have had a great deal of experience in connection with the manufacture of these different products by the Glucose Sugar Refining Company and other companies?—A. I first suggested the manufacture of rubber substitute to the Glucose Sugar Refining Company.

Q. That is, you were the first person that suggested that in this country?—A. I made the suggestion by letter, but I did not believe this process could be patented.

WITNESS FIRST EMPLOYED BY AMERICAN GLUCOSE COMPANY IN CONNECTION WITH THE REFINING OF CORN OIL.

Q. Will you, before explaining in detail that matter, give us a little of your experience in the manufacture of corn oil and of these other products—that is, tell us what different establishments you have worked for, what your relations with them have been, and how you came to be employed by the Glucose Sugar Refining Company?—A. Prior to the consolidation of the plants manufacturing glucose in this country I was the chemist of the American Glucose Company in Peoria.

Q. In Peoria, Ill.?—A. Illinois. The problem of refining corn oil had been under consideration for 10 years by that company.

Q. They had been before that time manufacturing simply raw oil?—A. The raw corn oil.

Q. And they had been considering the question of refining it?—A. Of refining it, and the chemical treatment of corn oil.

Q. But they had not yet succeeded in finding a process?—A. They had not succeeded in finding a process of treating corn oil chemically. The problem was submitted to me in 1895, 4 years ago.

Q. That is, the problem of finding a process of refining this oil?—A. And the utilization of corn oil, which was at the time without known industrial application, except in the manufacture of soft soaps. I went to Peoria from New York, and after a chemical examination of corn oil I undertook the solution of that problem. I went back to New York and after 1 month of investigation found out the process by which corn oil could be treated chemically, by which corn oil could be refined and rendered colorless. I returned to Peoria with my samples, which were simply laboratory samples. The president of the company at the time, Mr. William Hamlin, of Buffalo, asked me if I could produce the same results in 1,000 gallons quantity. I was satisfied that I could obtain the same results in 1,000 gallons quantity, and a refinery was erected under my plans and personal supervision. It was the understanding under my contract that, in the event of the oil not being equal to the laboratory sample, I would not receive any compensation for my services; but it was understood also that if the refinery proved a success, and if the oil could be demonstrated to be equal to the laboratory sample, I would be given 15 cents royalty per barrel. The factory was erected; it was 9 months before I could complete the refinery. At the end of 9 months the first attempt at producing 1,000 gallons was made under my own supervision and in the presence of two chemists of the company. The result was that the oil made in 1,000 gallons quantity was far better than the laboratory samples which I had brought with me from New York. An agreement was entered into by which I was to receive 15 cents per barrel royalty, and as the company at the time contracted to make 100 barrels, it meant simply—

ORGANIZATION OF THE GLUCOSE SUGAR REFINING COMPANY.

Q. (Interrupting.) One hundred barrels in what length of time?—A. A day. It meant \$15 dollars a day royalty. Two months after—it was less than 2 months—a very little time after the refinery had been proved a success and when I expected to receive my 15 cents per barrel, I was informed of the consolidation which was taking place, in fact the consolidation of all the glucose plants in the United States under the name of the Glucose Sugar Refining Company.

Q. This combination included all the plants in the United States?—A. All but one. The consolidation took place before I had received 1 penny of royalty, and, if I am well informed as to the financial aspect of the transaction, the American Glucose Company, for a nominal consideration, sold their plant in Peoria to the Illinois Trust and Savings Bank of Chicago. The Illinois Trust and Savings Bank turned around and sold the plant for another consideration, which was not a nominal one; and I found myself at the time with a contract on my hands which was worthless, from the fact that the American Glucose Company was out of existence.

Q. This plant was sold to what company?—A. The refinery which I erected in Peoria passed as a part of the assets of the new combination.

CONTRACT WITH GLUCOSE SUGAR REFINING COMPANY.

Q. That is the Glucose Sugar Refining Company?—A. Yes; the Glucose Sugar Refining Company. I had no recourse against the American Glucose Company, which was out of existence. I had no contract with the Glucose Sugar Refining Company, which was the new combination, so I found myself with a contract which I have here; yet when I thought it was proper for me to notify the combination about the existence of my contract with the American Glucose Company I was requested to go to Chicago to talk the matter over and demonstrate the value of my process. The result of that trip to Chicago was a contract with the Glucose Sugar Refining Company for 5 years. The terms of this contract with the Glucose Refining Company, which I will now call the Sugar Trust from this very moment, were, first of all, that for a period of 5 years from September 27, 1897, I was to receive an annual compensation of \$3,600 a year for my professional services, to be paid monthly in installments of \$300, but I was to act as consulting chemist of the company and counsel on all questions bearing upon the manufacture, uses, treatment, and application of corn oil.

Q. If you did not work for any other company?—A. If I did any other work for any other company it would be a violation of my contract. The contract on that point reads thus:

“Ernest Mas binds himself not to act as consulting chemist of any other company or firm or individual in the United States engaged in the manufacture or refining of corn oil, or in the manufacture of starch or glucose or proposing to engage in any such manufacture, or to enter into the employ of or render any

services to or become in any way identified with any such company or firm or individual; but said Ernest Mas shall be free to act as consulting chemist or in any other capacity for any company or firm not falling within the above prohibition and to engage in any other business than that of manufacturing or refining corn oil or the manufacture of glucose or starch."¹

In the next place, I bound myself to continue my laboratory experiments and researches in the production and refining of corn oil, and I also bound myself to give the Glucose Sugar Refining Company the exclusive use and benefit in the United States of all the results of my experiments and discoveries in that direction during the period of 5 years.

Q. Perhaps you can sum up and give us in a word or two any other special points there may be in your contract?—A. In the next clause there was this: I was to receive an annual compensation of \$3,600, and in addition to that I was to receive also 1 per cent on all the proceeds of corn oil turned out under my process. A very significant stipulation of this contract which I have faithfully carried out is that I had to waive and release all claims against the American Glucose Company which I may have had under my contracts, and the Glucose Sugar Refining Company was assuming every responsibility of the American Glucose Company. It also guaranteed me against any claims which the American Glucose Company might have against me for professional services or otherwise.

Q. Now, after this contract was made you continued your laboratory experiments, making regular reports to the Glucose Sugar Refining Company?—A. In accordance with the terms of this contract I made practically an assignment to the Sugar Trust of all my processes, and started my experiments again in New York City, and have from that time sent laboratory reports every month covering the results of my investigations during the month. I declined three propositions made to me by other concerns owing to the existence of this contract, and I received exactly on the 1st of each month, for a period of 14 months, a check of \$300 covering my monthly compensation as per contract.

Q. That sum you say you have received for 14 months?—A. For 14 months consecutively I have received \$300, covering my monthly compensation.

COMPANY DID NOT LIVE UP TO THE CONTRACT.

Q. When did that period of 14 months end?—A. I have never received a monthly statement of the oils sold. There is a clause in our contract which specifies that monthly statements shall be rendered by the Glucose Sugar Refining Company to Ernest Mas, showing the amount of prepared or refined oil sold, and payment shall be made monthly to Ernest Mas, based on the amount of said oil sold, upon the basis of 1 per cent on the amount of such sales, as per contract.

Q. That is, they lived up, for a time at any rate, to the part of the contract which stated that they were to pay you \$300 a month, but they did not render these reports on the corn oil manufactured?—A. They did not render the reports on the corn oil manufactured. I have never received a monthly statement for the oil sold, so I made a demand for monthly statements from the company, but I have not received any report yet.

Q. At what time did you make this demand for a statement?—A. Four months after our contract was made I made the first one by letter; I did not receive any reply, but received on the 1st of each month \$300 for my salary. I waited until the end of the year, thinking that, perhaps, I would then receive all the statements for the months past. So at the end of the year I made another demand for my 1 per cent commission as per contract, which I have not received as yet.

Q. That was at the end of the year 1898?—A. It was at the end of the year 1898. I received my last check on the 21st of December, 1898.

Q. Since that time you have had no further salary from them?—A. Since that time many peculiar things have happened. I did not know when I entered into a contract with the Sugar Trust what was in store for me. I thought that my attributions would be those of a chemist, when, to my great surprise, I received one day from the company, instead of my monthly statement, a very significant letter. This letter is signed by the president of the company: "I inclose some literature which we are having prepared to offset newspaper talk about the unwholesomeness of glucose, starch, etc., and would like to have you sign the petition and also to interest as many of your friends as possible in doing the same. (Signed) C. H. Matthiessen, president Glucose Sugar Refining Company."

¹ See contract at end of testimony.

WITNESS REFUSED TO SIGN TESTIMONIALS.

Q. What was the nature of this petition he wished you to sign?—A. First of all there was a copy of the bill introduced in the Senate of the United States by Mr. Mason on the subject of mixed flour. I did not at first understand what all this meant. I kept all those papers; I did not sign any testimonial, and I do not propose to sign any. I do not consider that the attributions of a chemist are to sign testimonials, but to attend to his business as a chemist.

Q. Did you think that these testimonials that you were asked to sign would give a false impression to anyone who might read them?—A. It was my impression that I could not consistently sign a testimonial which was evidently intended to counteract a legislative measure.

Q. That is, a law has been passed providing for the prevention of the adulteration of foods, and they asked you to sign a testimonial which would say practically that there either was no adulteration or that the adulteration was not injurious. Was that the nature of the testimonial?—A. It was practically to state that flourine, or whatever it is—glucose—in fact, all the by-products manufactured by that branch of the sugar trust, called the Glucose Sugar Refining Company, were all right.

Q. That all their products were of legitimate uses, or articles of food?—A. I did not think I could sign that paper, and I did not sign it.

Q. You could not conscientiously, as a chemist, sign the paper?—A. I do not wish to commit myself too far in this matter. I did not feel like signing that paper, simply because I was not satisfied, and I am not yet satisfied, that flourine is equal to wheat flour, that glucose is as good as sugar, that corn oil is as good as linseed oil, that corn cake is as good as flaxseed cake, and that the rubber substitute made from corn oil is as good as rubber.

Q. They practically asked you to sign that statement which would have declared that the products of the Glucose Sugar Refining Company were equal to the genuine products you have mentioned?—A. It was practically that. The next bill which I received was from Mr. Brosius. This was to prevent adulterations or branding or imitation of foods, beverages, candies, drugs, or condiments in the District of Columbia and Territories, H. B. 9154. I did not pay any attention to that either.

Q. For the same reason?—A. For the very same reason. The next one was from Mr. Pearce, of Missouri.

Q. That is, the bill was introduced by him; but you received these bills, I understand, from the president of the Glucose Sugar Refining Company?—A. And the request to sign the testimonial to the effect that the goods manufactured by the company were, to use the words of the president of the company, "In order to offset the newspaper talk about the unwholesomeness of our products." I have not signed these papers yet and I do not intend to sign them.

THE PATENT ON RUBBER SUBSTITUTES.

Q. Were there any other requests made by the Glucose Sugar Refining Company that you thought, as a reputable chemist, you could not accede to?—A. Here is another one; my attention was called in the month of December, 1898, to the fact that a party in Ohio, Mr. William K. Leonard, of Piqua, Ohio, had invented a process for the transformation of corn oil into rubber substitutes. I immediately notified the company that my attention had been called to that patent, but not knowing who the patentee was, I told the company that I was not prepared to make any comments as I had not seen a copy of the specifications which I had already sent to Washington for, but that I could challenge the validity of such patents at any time.

Q. That is, you had seen a notice that this patent had been applied for?—A. (Interrupting.) I had notified the company.

Q. But in your judgment there were no grounds for issuing such a patent, because the process was already known?—A. The process has been known for about 50 years in the old country, and is public property, and I did not think it could be patented at all, so I wrote to the company that I was ready as the chemist of the company to challenge the validity of that patent. I did not know who was the patentee at the time, and I do not know who the patentee is to-day, and I am very much surprised to see that a patent is granted to the sugar trust, or at least that branch of the sugar trust which is named the Glucose Sugar Refining Company.

Q. You say the patent was granted to that organization?—A. No; it was granted to Mr. William H. Leonard, of Piqua, Ohio.

Q. But you think the patent is practically controlled or owned by the Glucose Refining Company?—A. I have no information regarding what is really patented, but I see that the specifications of this patent are practically worded in the very same terms as my chemical report sent to the company 8 months before.

Q. If I understand, then, this matter which is connected with the patent is this: that you had made a special report to the company on the manufacture of a substitute for rubber from corn oil?—A. Yes, this was made on October 26, 1897.

Q. That some months after this process was patented by some person unknown to you; that when you received specifications of the patent you found that these specifications were worded almost exactly the same as your report to the company had been?—A. Almost exactly the same.

Q. That nevertheless you believed the process is one that could not properly be patented because it had been known for some 50 years?—A. That is exactly the case.

Q. You believe, then, that the president of the Glucose Sugar Refining Company, to whom your report had been made, secured this patent which you believed to be illegal?—A. I can not say that positively, but I can say this—

Q. You believed it to be so, from the fact that the specifications of the patent were substantially the same as your report to your president?—A. It looks that way.

Q. That is the point that I understood you were making?—A. It looks that way. Now, what surprises me more than anything else is this, a request from the company to me as chemist: "Please send your next laboratory report in the form of an affidavit covering your investigations as an expert in the manufacture of rubber substitutes, the date of your experiments in New York, the date of the first commercial production of the same." There are 15 or 16 inquiries which I shall not name.

Q. It amounts to this, I judge, from what you say: they ask you to make an affidavit to show this was not patentable?—A. They wrote me to make out an affidavit so as to be ready in the event of any legal action that might be resorted to by parties interested in the Leonard patents.

Q. You having had a long and thorough experience in the manufacture of rubber substitutes they wanted your next laboratory report in the form of an affidavit, in such a way that they could defend the manufacture of this rubber substitute against any suit that might be brought by this patentee?—A. I knew the Glucose Sugar Refining Company was contemplating the manufacture of rubber substitutes and wanted me, of course, as a chemist, to assist them; but I did not wish to commit myself again by signing a paper which I could not conscientiously sign because the process could not be patented, and so notified the president of the company that I was ready to go to Chicago whenever my services were needed, or to appear in case that any action should be taken by the patentee of the rubber substitute process.

EFFECT OF THE GLUCOSE SUGAR REFINING COMPANY ON PRICES.

Q. You can perhaps now tell us something with reference to the control that the Glucose Sugar Refining Company has over the market; in the first place, you said, I believe, that the company included all of the plants of the kind in the country, with the exception of one, when it was first organized?—A. Except one; 90 or 95 per cent of the production of glucose in the United States.

Q. Is that condition substantially the same at the present time? Do they still control 95 per cent of the output?—A. From 90 to 95 per cent.

Q. What has been the effect of this control of the combination upon the prices of the product?—A. Before answering that question it seems to me I ought to mention one fact, the result of my not signing those testimonials. It was simply this: I have not only failed to receive my monthly statements, but from the very day when I declined to sign those papers I have not even received my monthly check. So I find myself to-day with a 5-year contract with the Glucose Sugar Refining Company, binding me not to give my services to anyone else. I have assigned all my processes to the branch of the Sugar Trust which I call the Glucose Sugar Refining Company; I have instructed the chemist of the company how to refine corn oil, and from the 1st of January I have not received a single dollar of compensation.

PRESENT RELATIONS WITH COMPANY.

Q. (By Mr. KENNEDY.) Have you taken any legal action against the company?—A. It is my intention to do so when I see I have been waiting long enough. I intend to take such steps as soon as my legal adviser says the time has come.

Q. (By Mr. JENKS.) Then, if I understand you, the situation is about this: In your own belief you were cut off from receiving any further salary because you declined to sign some testimonials which you could not conscientiously sign? You believed you were living up to the terms of your contract fully and completely, and that signing testimonials was no part of your work as a chemist, particularly testimonials which you believed would mislead the public?—A. I could not sign conscientiously, that is it.

Q. (By Mr. KENNEDY.) Have you had any formal notification by the company of the severance of your relations?—A. The company has informed me that I could not enforce my contract. I replied to the president of the company that this contract is in force until the 27th of September, 1902, and that it is entirely out of the power of the president of the sugar trust and any man's power to cancel this contract without mutual consent.

QUESTION OF PRICES RESUMED.

Q. (By Mr. JENKS.) That gives, then, at the present time, substantially what your relation to this combination is, so far as your personal relation goes. Now, may we take up this question of prices? What has been the effect of the combination upon the prices of the products made by it?—A. When I was first engaged by the American Glucose Company the price of glucose was about 80 cents per hundred. The consolidation took place, and if I have a clear understanding of what a trust means from an industrial standpoint, it is to reduce the expense and consequently to reduce the price of the finished product. A little while after the trust was formed the price of glucose went up to \$1.60, or 100 per cent above the price prior to the combination. The price of glucose to-day, I believe, is \$1.35.

Q. Whereas before the combination was made it was about 80 cents?—A. It was about 80 cents.

Q. As regards the effects on the prices of the other products?—A. In the line of corn flour I can not tell exactly, because the applications of this product are so secret that it is impossible to get data.

Q. I understand by that statement that there is not an open market for this corn flour?—A. There is some market for corn flour so long as it is offered as corn flour, but so long as we have wheat we shall not buy corn flour, because we can not produce a quality of bread which is acceptable from corn flour.

Q. In your judgment, then, a large proportion of this corn flour manufactured by the Glucose Sugar Refining Company goes into the hands of flour manufacturers for mixing with wheat flour, and is not sold in the open market?—A. Yes; it is offered in the open market, but not as being equal to wheat flour.

Q. The reason I put my question in this form is this: You said you had been unable to determine the effect of this combination on the price of corn flour, and I inferred that if the products were sold regularly in the open market you could have discovered that easily.—A. The only thing I have been able to find out yet was through a microscopic examination of the Minneapolis flour. I have examined some samples; I have found some startling results. It is extremely difficult to trace the presence of corn flour in wheat flour. The best experts are often misled by the method of grinding. Microscopic examination shows a difference in texture which has enabled me to detect the presence of corn flour in wheat flour.

Q. So you have found corn flour mixed in wheat flour in some Minneapolis brands?—A. In the samples submitted to me from Minneapolis. The samples were sent to me without any name, and I can not mention the name of the concern that mixed corn flour with wheat.

Q. Now, can you tell us the effect of the combination upon the prices of corn oil?—A. Upon prices of corn oil the result has been about the same. Corn oil which used to sell for \$2.25 per 100 pounds is worth to-day 4 cents per pound.

Q. That is, it has gone to \$4 per 100 pounds?—A. Whether the increase in price is due to my process of refining corn oil or to some other cause I do not know. The dilemma is simply this: If the price is due to the refining process it is admissible that the refined product commands a higher figure than the crude.

Q. This price, then, of \$2.25 was for crude oil?—A. It was for crude.

CRUDE CORN OIL SOLD FOR REFINED.

Q. And the price of \$4 per hundred quoted to-day—is that for refined oil or for the crude?—A. It is for the refined. It is supposed to be for the refined, but I find out that samples are submitted to me by my former clients who have been charged 4 cents, or \$4 per hundred, and which are not samples of refined oil, but simply crude oil. I have called the attention of the company frequently to that point.

Q. Then this oil that was sold to some of your former clients for \$4 a hundred as refined oil when submitted to you for analysis was found to be crude oil?—A. Crude oil.

Q. Your inference from that is that the Glucose Sugar Refining Company at the present time is selling crude oil under the name of refined oil?—A. That is the way it looks to me.

Q. And getting refined-oil prices for it?—A. In some instances.

Q. You say you have received complaints from your former clients to this effect. About how many such complaints have come to you? Can you recall?—A. Oh, about 20.

Q. From different sections of the country?—A. From Alabama, Maryland, New York, and many other States which I do not remember.

Q. So that this custom of selling crude oil under the name of refined seems to be quite widespread in your judgment?—A. It may be that a mistake has been made, but I have called the attention of the company to the fact. That is all I can do. I have nothing to do with the commercial part of the enterprise. The only thing I could do was to call the attention of the company to the fact that people had been charged refined-oil prices for crude oil.

Q. Is it difficult for a person who is not an expert to distinguish between crude oil and refined oil?—A. The consumer of corn oil in large quantities will recognize it immediately without being an expert. It can be recognized by what is called the organoleptic test, which is a test by looking at it through a glass.

Q. Is this test one that would be applied by the ordinary consumer?—A. The large consumer would apply it. The small consumer would not.

Q. Are these complaints that come to you largely from the smaller concerns?—A. From jobbers mostly.

Q. What is the difference at the present time between the price of the crude product and the refined product, so far as the market quotations go?—A. I have endeavored to get those quotations from the company, but I have never been able to get a reply on that subject.

Q. And these prices are not quoted regularly in the trade papers?—A. The prices are fixed. I am satisfied as to that. And that is where I have found out that I had to deal with a trust. I did not know what a trust was until I found out I was dealing with the genuine article.

Q. Let us go back to the other point for a moment. What, in your judgment, is the principal difference in value between the crude oil and refined oil?—A. It is the difference between \$2.25 per hundred and \$4 per hundred.

Q. Now, if I understand you, you mean to say that the effect of this combination upon the prices consists simply in their selling crude oil under the name of refined and at the proper prices for refined?—A. The effect of the combination has been this: One hundred thousand bushels of corn are used, from which, in my opinion, 500 to 600 barrels of corn oil are recovered. This quantity of 500 or 600 barrels I shall put at 200,000 pounds per day, basing my calculation on 500 pounds to a barrel. The difference in price between \$2.25 and 4 cents gives a difference in price in favor of the new process which amounts to \$4,000 a day advance price for the company on corn oil alone.

Q. They have advanced the price enough so that it gives them an added income of \$4,000 a day on corn oil alone?—A. It was not a question of salary which induced me to join the Glucose Sugar Refining Company. It was the question, under the contract, of that 1 per cent which was the inducement offered me to join that concern. Some information has reached me to the effect that last year \$1,750,000 worth of corn oil, supposed to be refined oil, was distributed in the United States and abroad. This is what I have been able to trace. On a basis of 1 per cent, I ought to get out of that \$17,500 commission, which, with my salary of \$3,600, was shown to me by the president of the company to be a sufficient inducement to sign a contract for five years for my services—for the exclusive use of my services.

Q. Let us go back to the question of the price for a moment. Was there any market price at all for refined corn oil before the trust was formed?—A. Corn oil was a drug in the market at the time. It was absolutely impossible to sell it.

Q. It must have been sold at some price. You were manufacturing refined oil there at Peoria with the American Glucose Company at that time. Do you know what price they received?—A. For crude oil?

Q. No; for refined oil. There was a short time, if I undersand correctly—A. (Interrupting.) \$3.50.

Q. (Continuing.) After you had built a refinery before the trust was formed?—A. \$3.50 for the crude oil. For a while they were receiving \$3.50 to \$3.75.

Q. Now, the difference in price between that day and the present for the refined oil, provided that any refined oil is sold now at all, would be simply the difference

between \$2.50 and \$4; is that right?—A. Is it not in that case as it has been in another case which I have read about? It comes from the same tank. If a man insists upon getting 4-cent refined oil, he gets it; if he does not, he gets the crude and he gets charged 4 cents.

Q. The main effect, then, has been that they are selling crude oil for refined quite generally. Now, can you give us the effect of the combination upon the price of any other of their products? You have spoken of the glucose, which is double in price, and of its effect upon the price of corn oil. How about its effect upon other products?—A. It is impossible, as I have already said, to get quotations on what they term flourine unless you are an insider. As to rubber substitute, I can not sign this affidavit to the effect that the process can be patented, because, in my opinion, it can not be patented.

Q. What has the effect upon the price of rubber substitute been? Is there any increase in the price of that?—A. People do not like it; it has some drawbacks which do not appear at first. Of course, the reduction is such that it is an inducement to use rubber substitute in place of para rubber, but I am under the impression that this process is not a success.

Q. You are not able to detect in the market any difference in the price of this rubber substitute as time goes on?—A. In fact, the sugar trust controls practically the entire production of corn oil and rubber substitute in the United States.

Q. So that, in your judgment, they fix the price at whatever height they think will bring them the largest net income?—A. Yes.

VALUE OF PLANTS AND CAPITALIZATION OF GLUCOSE SUGAR REFINING COMPANY.

Q. You have spoken once or twice with reference to the price at which this corn-oil refinery, that you put up in Peoria, was sold to the Glucose Sugar Refining Company. Can you give us any information with reference to the value of the plants that are consolidated in the Glucose Sugar Refining Company as compared with their capitalization?—A. I can not give a very accurate estimate or approximation, but I believe that \$6,000,000 would be a fair price.

Q. Do you believe that the plants they have now could be reproduced for \$6,000,000?—A. Not including the real estate. The real estate constitutes most of their value. They are mostly old worn-out plants.

Q. Can you give an estimate that you think would be fair and conservative as to the value of all the plants they have, including the real estate, at the present time?—A. \$6,000,000.

Q. Including the real estate. What is their capitalization?—A. \$40,000,000.

Q. Have you taken any special pains or made any careful study of the value of these plants in order to make this estimate that you put on them of \$6,000,000?—A. I have seen them as a chemical engineer; and it is as near as I could make an estimate if I had to furnish one to another manufacturer.

Q. Do you know what dividends this company has paid upon its \$40,000,000 capitalization?—A. I understand that the company is paying 1½ per cent dividend quarterly.

Five per cent a year?—A. Yes.

On \$40,000,000 capitalization?—A. On \$40,000,000 capitalization.

Q. You spoke of having yourself built this corn-oil refinery. Can you tell us approximately or accurately how much it cost to build it?—A. Approximately, I believe I could. We put in machinery, apparatus, building, and connections, but I believe that not over \$25,000 was invested.

Q. Not over \$25,000. Do you know what price was secured for that when it went into the combination?—A. You mean for the assets?

Q. Of this one plant; yes.—A. It is a matter of public report or record, I guess, that half a million dollars was the price of it at the time.

Q. It was put in at half a million dollars?—A. That is what I read; I do not know where I have read it; I can not tell exactly where I have read it; and I will only give that as my opinion.

RELATIONS OF GLUCOSE SUGAR REFINING COMPANY TO THE SUGAR TRUST.

Q. You have spoken several times of the Glucose Sugar Refining Company as part of the Sugar Trust. What reason have you for thinking that the two are connected in any way?—A. I have simply this reason. When I entered into the contract with Mr. Mathiesen, after the experience I had before the consolidation, I wanted to know if the corporate existence of the Glucose Sugar Refining Company would last at least 5 years. That was the time of my contract. Mr. Mathiesen told me himself that Mr. E. O. Havemeyer was his uncle, and gave me a gentle hint that there was before me the opportunity of my life, of becoming

HEARINGS BEFORE THE INDUSTRIAL COMMISSION.

the chemist of the Sugar Trust. I did not understand at the time what it meant, but I understood with such a guarantee, moral guarantee, as that of Mr. H. O. Havemeyer I had nothing to fear about my 1 per cent and my salary, so I signed that contract for 5 years. But I have no tangible proof of a combine existing between the Glucose interest and the cane-sugar interest.

Q. You say you have no proof of that?—A. I have no proof of that. I infer simply from what I have been able to see during my 20 years' experience.

Q. What relations exist between the uses of glucose and the uses of cane sugar which would make it advantageous for the two to be combined? Are there any?—

A. The glucose sugar does not conflict in any way with the cane-sugar market. Glucose is worth \$1.35; sugar is worth a great deal more. I believe that the existence of the Glucose Sugar Refining Company is due entirely to that cause, which I may call the law of demand and supply, which calls for an article cheaper than pure cane sugar; and it is with the Sugar Trust as I believe it is with any other concern. When a corporation has established a name for the sale of a pure article, such as crystallized sugar, and the demands of the trade are for cheapening compounds, the mother house, if I can call it that, creates another house.

Q. A related house?—A. A related house under them, whose business is simply to supply the trade which the parent house does not care to supply. So I believe there is a combine existing between the Glucose Sugar Refining Company and the American Sugar Refining Company; there is at least an understanding.

Q. That is, there are certain uses to which glucose can be put that, if it were not for the existence of glucose, would have to be supplied by sugar, as, for example, the manufacture of cheap candies, or something of that kind?—A. I believe that when we get the new sugar-producing countries to giving us all the sugar in the raw condition, there will be no reason for the existence of any glucose concern in the United States.

Q. That is, you think that raw sugar will ultimately come from Cuba, the Philippines, etc., and be as cheap substantially as glucose is?—A. Then sirups can be made which will be free from sulphuric acid and from all the objections that glucose sugar—

Q. You think that glucose sugar is objectionable on account of the presence of sulphuric acid?—A. On account of its mineral acid reaction. The four legs upon which the Glucose Sugar Refining Company stands to-day are, glucose as a cheap substitute for sugar, corn flour as a cheap substitute for wheat flour, corn oil as a cheap substitute for linseed oil, corn-oil rubber as a cheap substitute for rubber. I do not wonder that the American Sugar Refining Company do not care to put their names on the barrels of goods manufactured by the Glucose Sugar Refining Company.

Q. (By Mr. C. J. HARRIS.) Do I understand you to say that the American Sugar Refining Company puts their name on?—A. No; I say I am not surprised that they do not. To come back to my own personal contract with the company, I have reason to say that the Sugar Trust believes that it is the understanding of our contract that I am engaged as a chemist to sign testimonials in order to offset newspaper talk, to indorse affidavits on legal points which I do not understand, and to work simply to counteract legislative measures. I shall not be a party to such schemes.

Q. (By Mr. KENNEDY.) Is there anything in that contract which could possibly be construed so that you would be called upon to perform such duties for the Glucose Sugar Refining Company?—A. If there had been such a clause I would not have signed the contract.

EXTENSIVE INTERESTS OF THE SUGAR TRUST.

Q. (By Mr. JENKS.) You will perhaps put a copy of that contract in evidence, if you have a copy here. You have explained some of the evils which come from these combinations—the increase of their prices, etc. Can you suggest any remedy?—

A. As a chemical engineer, I believe in combines which are intended for economical purposes to reduce the cost of production, but I do not believe in combines the effect of which is just the reverse. We have not reached the time that we may be afraid of the universal trust; but if that trust should ever come it will not come from the Beef Trust or the Standard Oil Trust. They manufacture a great many by-products, no doubt, but they do not manufacture one-tenth of the products manufactured by the Sugar Trust. I was at first under the impression that the Sugar Trust was simply manufacturing sugar until such a time as I found out that they were interested in almost anything and everything, from glucose, I should have said, to rubber boots. I do not believe that Mr. Rockefeller will ever have anything to offer to Mr. Havemeyer, and I do not believe that Mr. Armour will ever have anything to offer to Mr. Havemeyer; but I do believe that

the time will come when Mr. Havemeyer will be able to sell to Mr. Rockefeller enough corn oil to revolutionize the entire production of linseed oil in the United States, and to Mr. Armour all the feed stuff that he may need to run his stock yards. I have read about the proposed billion-dollar combine of brewers. I should like to ask a brewer what he would do if the Glucose Sugar Refining Company should tell him that he could not get any glucose. He could not make his beer.

Q. You mean that practically all the beer in the country at the present time is manufactured with glucose?—A. I simply wish to point out that if there is a dangerous trust—if there has ever been any danger from a trust—it is the trust which controls all the sugar, the breweries, the corn flour, the corn oil, and rubber substitute of this country.

Q. Is glucose used regularly in the manufacture of beer?—A. Glucose is used as a substitute for yeast in the manufacture of beer.

Q. Do you think that use is quite general?—A. Almost universal.

Q. Do think that the glucose used in the manufacture of beer and cheap candies is deleterious or injurious to health?—A. I am not a physician, and I can not give you an answer that would be of any weight. I have simply conducted experiments with the view of finding the action of glucose upon membranes of a vegetable nature, but not upon membranes of the stomach, because, as I say, I am not a physician. The results of my investigation, I consider, belong to the company, and I do not feel at liberty to mention that here.

Q. The same answer would apply, would it, to the question as to the nutritive power of corn flour as compared with white flour?—A. I do not question the nutritive power of corn flour.

Q. Do you think it is equal to that of white flour?—A. Opinions are divided on that question. I have read the opinion of Professor Wiley, and I have agreed to some extent with his views; but there is a fact which remains, and that is that it is utterly impossible to make an excellent mixture of white bread from corn on account of its lack—

Q. (Interrupting.) Are the processes used in the manufacture of glucose and corn oil and in refining corn oil the same processes which you yourself discovered in part?—A. Most of them.

Q. Most of them are used by the Glucose Sugar Refining Company?—A. It would be unwise to patent a process which is based upon a combined application of mechanics and chemistry.

Q. So the processes are not patented, but are kept secret for the manufacture?—A. Yes.

A REMEDY FOR THE EVILS OF COMBINATION.

Q. I asked you some time ago if you had any remedies to suggest for the evils that you think are associated with some of these combinations. Have you any?—A. I do not wish to say anything that would be detrimental to the company; but I wish to speak about trusts in general, basing my remarks on personal experience. I believe that there is a remedy. It was suggested not long ago that, providing we can find a proper definition for a trust from an industrial standpoint, from a monopolistic standpoint, goods manufactured, staple goods, or food products manufactured by foreign concerns in the same lines, be admitted free of duty. I do not agree with that view of the situation. I believe there is a better remedy than that, and that is for the United States to put an internal tax on goods manufactured by corporations controlling the trade. Take, for instance, corn oil. A great many people write me, "We want to get a carload of corn oil." I have nothing to do with the commercial part of the institution, but they can not get that corn oil and consequently the demand is greater than the available supply. There is no question, therefore, as to the Sugar Trust controlling entirely all the products and by-products derived from glucose in the United States; and, in my opinion, when a corporation has reached a point where it controls not only the trade but fixes the prices, disregards contracts, disregards patents from other people—there is one, for instance (producing paper)—it is time for the Government to step in.

Q. Do I understand you to say in this case?—A. There is a man that has a patent on corn oil.

Q. That they are using regularly?—A. They do not care anything about that. This man would be a very good witness before the commission, I guess. He is a man of very high standing and integrity—Mr. George W. Banker, of New York. I was saying that when a corporation or concern has reached such a point, it seems to me that, with my limited knowledge of economics in this country, it is high time for the United States Government to step in; and the only remedy

which I suggest would be to put an internal-revenue tax on things the use of which is not fully known and the production of which is not possible by any other concern.

Q. That is, you would put an internal-revenue tax on monopolistic products manufactured in this country?—A. Instead of free import duty from other countries.

Q. (By Senator MALLORY.) Would not the consumer have to pay that tax ultimately?—A. I can say this: There is a point where the consumer will have to pay the tax temporarily, but ultimately he would buy less corn oil. When I joined the company he paid \$2.25 per 100 pounds. It is impossible to-day to get corn oil for less than \$3.75 to \$4, which is about 75 per cent higher than it would be to pay an internal-revenue tax of 80 or 40 per cent. The consumer would pay about one-half or one-fourth the tax, about one-half or one-fourth of the increase.

Q. Do you think that there would be an advantage?—A. It seems to me that all products the use of which is not perfectly clear, such as flourine, corn oil, and rubber goods, should not be controlled by one corporation, but by the Government. It is my study of the question and my personal experience that has led me to this.

Q. You think they should be under inspection by the Government, and that if an internal-revenue tax were levied on them they would be brought under the inspection of the Government; is that the idea?—A. And further than that, it is giving too much power to one man here to give him the right to dictate to any man in the country what he should do and what he should not do.

COMBINATIONS AND THE TARIFF.

Q. (By Representative BELL.) You spoke of the remedy of taking the tariff off an article that is syndicated. Would it be any benefit in a case like petroleum or coal oil, where you have practically no competition? The tariff would not help a syndicate like the oil syndicate, would it?—A. I do not quite grasp the question.

Q. You were speaking of the proposed remedy of taking the tariff from anything that is formed into a trust. Now, suppose it were iron, or steel, or petroleum, or rubber, that we can now beat the world on, would that be the remedy at all?—A. There is a distinction between those two—between the two classes of products—and that distinction is this: Take the Standard Oil Company, for instance; any man can discover an unlimited quantity of oil to-morrow and be in a position to compete to a great extent with the Standard Oil Company, but no man can organize an institution that will be able in 24 hours to compete with the Sugar Trust, because it does not require the discovery of a mineral product to be enabled to compete. It is a question of years and years of organization. The best American institution, as far as organization is concerned, I once thought to be the Standard Oil Company. I think I know better to-day. I do not believe there is a single barrel of corn oil shipped from Chicago to Russia which is not traced from the moment it leaves the factory until it reaches the consumer.

Q. You do not ship to Russia, do you?—A. We ship to Russia because there they do not know how to make corn oil to-day. They do not know how to make glucose. The United States has a monopoly and controls corn oil. For this reason the remedy, based upon the suppression of the import duty, would not be a remedy at all.

Q. Would it be a remedy for iron, or steel, or rubber?—A. That may be another case. Being an expert only in this line, I can not express an opinion on any other.

Q. We are shipping iron and steel right into London at the present time?—A. I can not express an opinion upon iron and steel. My 20 years' experience has been in corn oil, glucose, and sugar.

Q. It seems to me if you had your internal tax on the products of the trust they would simply put it on the consumer?—A. The internal tax would certainly not be 100 per cent unless it was deemed advisable by the Government to put it so high. I spoke simply of products the use of which is not perfectly clear, such as the products of the Glucose Sugar Refining Company.

Q. You do not doubt at all, do you, but what the Standard Oil Company is a trust?—A. I do not consider the Standard Oil Company a trust; that is a pretty wild expression of opinion. I recognize a distinction between a trust and an absolute monopoly. I believe we may consider that the Standard Oil Company has an absolute monopoly of petroleum.

Q. What would you do with an absolute monopoly like that? What remedy would you propose?—A. I have suggested a remedy in the case of which I am speaking. I said I would not feel justified in expressing an opinion on some other question.

Q. You say you believe in combination. You do not believe in combinations

like that?—A. I do not believe in combinations like that. I believe, as a chemical engineer, in simplifying; and it seems to me the immediate result of a combine is to simplify. There are certainly good points in combines which should be taken into consideration. If the aim of combines is to reduce the cost of production, I am certainly in favor of them; but when the evident purpose is to monopolize trade, to control and regulate the consumption, the question is simply this: To find out first of all a proper definition of a trust—I come again to the original question—and then the Government should step in, it seems to me. I have nothing to suggest except an internal-revenue tax on goods the use of which is not perfectly clear.

EFFECT OF COMBINATIONS ON WAGE-EARNERS.

Q. May not all the great manufacturing institutions shut down plants and leave the men without employment and do no injury at all to the owner of the individual plant?—A. I have been studying the industrial aspect of the question, but I have not given any time to the labor aspect.

Q. Would any of your remedies cover a case of mills closed by a combination whose owners still received profit from the combination?—A. I repeat again that I can only suggest, as a result of my personal experience, a remedy in such a case as the Glucose Sugar Refining Company. It is to be expected that, by simplifying and by combining, a great many people will be thrown out of employment. That is to be expected. Traveling salesmen may be thrown out of employment by the fact of combining the interests of the Glucose Sugar Refining Company.

Q. Is not that just the way you lost your place?—A. The way I lost my place? I have not lost my place, for the simple reason that the Glucose Sugar Refining Company is one of my clients to the extent that they have tied me up by contract for 5 years. I have agreed for a certain consideration not to engage my services with any other corporation in the United States until the 27th day of September, 1903.

Q. But if your company had not gone into the trust is it not your idea that you would have had amicable arrangements with them up to this time?—A. If the company had not formed a trust I should not care anything about what they did, because I could find employment to-morrow with another corporation. The aspect of the question is entirely different. I can not go to-morrow to another concern, because there is no other concern in the United States.

Q. And it absolutely blacklists you, does it not?—A. And consequently whether I carry out the terms of my contract or not I am no better off.

Q. But you have no opportunity whatever now of getting employment in your line of business in the United States on account of this trust?—A. Unless there is another corporation being formed, willing to engage my services and take their chances, knowing that there is a contract existing with the trust. I could not to-day, without violating my contract, join any other company, and further than that there is no other company; so the situation created by the labor aspect of the question, which is the result of simplifying in the case of traveling salesmen, is an entirely different question from the one I have considered.

Q. Does not the private syndicating of these institutions result in making labor absolutely powerless?—A. Yes; there are remedies which the labor organizations can use.

Q. How would the organization remedy it in the town of Pueblo? I notice that in the town of Pueblo they have about 2,500 men working as smelters. The law provides that they shall only work 8 hours after the 15th of June. Now, the smeltermen and the friends of the smelters say to these laborers, "We are indifferent; we are in a trust; it makes no difference to us whether we shut down in Pueblo or not." If they do shut down in Pueblo, they can go on running the smelters at Denver, at Salt Lake City, and at Omaha the same as in Pueblo, and make the same profit as though their smelters were running there, but the laborers are without employment.—A. Now, you have reached a point where there is some similarity between your case and the case I have in view. I have found out that the Sugar Trust is conducting its business under methods which it is absolutely impossible for anyone to understand. You were saying that if they should leave one corporation, or one concern of the trust, they would simply have to go to another.

RELATIONS OF WITNESS TO GLUCOSE SUGAR REFINING COMPANY RESUMED.

Q. And does not that blacklist them? Suppose a man strikes in one branch of the Sugar Trust, or take your case, you are now at outs, as it were, with one branch of the Sugar Trust; will not that blacklist you in every one in the United States?—A. Well, I am inclined to think it may, simply because the last time I

went to Chicago there were Professor Horton, Dr. Fuelling, Professor Humphrey, and Dr. Arno Behr, all of them chemists of the highest rank, and Mr. Thomas Gaunt, general superintendent of the company, under a 5 years' contract like myself, with a salary of \$25,000 a year.

Q. (By Mr. JENKS.) These other chemists also were in the employ of the company?—A. They formed a part of the chemical staff of the Sugar Trust, that branch of the Sugar Trust which is the Glucose Sugar Refining Company, every one of them.

Q. How is it to-day?—A. Dr. Arno Behr is in California, and I do not know what he is doing. Professor Humphrey is somewhere in New York looking for a position. I do not know where Professor Horton is; and I am here. Now, it seems to me that there is a constant process of assimilation and elimination; the assimilation of knowledge whenever there is an opportunity to get it and a process of elimination when the knowledge has been imparted. That is exactly my case, and there is no remedy there.

Q. (By Representative BELL.) Now, could not your company refuse or fail to run a particular institution that you were superintending and supply the demand from other companies and leave yours out?—A. There is no other company.

Q. I thought there were numerous glucose companies?—A. My contract is made with the trust.

Q. Suppose the combination would not manufacture that particular article? I am talking about your ideas and your remedy.—A. There is no remedy in this case. I believe that I have as much right to look into the books of the Glucose Sugar Refining Company as the president of the company has under the terms of my contract.

Q. (By Mr. JENKS.) At what time did you say it was that you were employed by the American Glucose Company in Peoria?—A. I have the contract here.

Q. It is the date we are after.—A. Three years prior to this time. I had been 2 years with the Peoria concern prior to joining this institution. I have not here a copy of the contract with the Peoria people. I thought I had it with me.

Q. It would be sometime, then, you think, in the year 1895?—A. I believe it was 1895. I was at that time under contract with a great many private concerns, corporations, I know.

Q. Can you tell me what time this combination was effected by which the American Glucose Company went out of existence?—A. It was 2 months, perhaps, before I joined the trust.

Q. About what time was that?—A. It was in July or August, 1897.

Q. Probably in July or August, 1897, that the Glucose Sugar Refining Company was formed?—A. Yes.

Q. Then your contract with them is dated—A. A month or two after, 2 months after, I guess.

Q. There had been negotiations pending before that time?—A. That was simply on account of differences between the two.

Testimony closed.

NOTE.

Following is a copy of the contract between Mr. Mas and the Glucose Sugar Refining Company, referred to by him on page 76 of his testimony:

This agreement, made at Chicago, Illinois, this 27th day of September, A. D. 1897, by and between Ernest Mas, consulting chemist and chemical engineer, of Brooklyn, New York, party of the first part, and the Glucose Sugar Refining Company, of Chicago, party of the second part.

Witnesseth, that said party of the first part being a consulting chemist and an expert in oil refining, and said party of the second part being a manufacturer of crude corn oil, it is agreed as follows:

For and in consideration of the payment of one dollar cash in hand, paid this day, and the further consideration of an annual compensation of three thousand six hundred dollars (\$3,600) per year for his professional services (payable in monthly instalments of three hundred dollars (\$300) per month on the first of each month by said Glucose Sugar Refining Company), Ernest Mas becomes from this date, and for a period of five years, the consulting chemist and chemical advisor of the Glucose Sugar Refining Company on all questions pertaining to corn oil, its methods of extractions, uses, manufacture, special treatment, and preparation and industrial applications.

Ernest Mas binds himself not to act as consulting chemist of any other company or firm or individual in the United States engaged in the manufacture or refining of corn oil, or in the manufacture of starch or glucose, or proposing to engage in any such manufacture, or to enter into the employ of or render any

services to or become in any way identified with any such company or firm or individual; but said Ernest Mas shall be free to act as consulting chemist or in any other capacity for any company or firm not falling within the above prohibition, and to engage in any other business than that of manufacturing or refining corn oil or the manufacture of glucose or starch.

Ernest Mas agrees to continue in New York his laboratory researches and investigations on the treatment, preparations, and refining of corn oil, and binds himself to give the Glucose Sugar Refining Company the exclusive use and benefit in the United States of all the results of his experiments and discoveries in that direction during the term of this contract.

In addition to the annual compensation of three thousand six hundred dollars (\$3,600) per year for five years, Ernest Mas is to receive from said Glucose Sugar Refining Company an amount equal to one per cent on the proceeds of all corn oil refined and prepared under processes or methods discovered by the said Ernest Mas and sold by the Glucose Sugar Refining Company during the life of this contract. Monthly statements shall be rendered by the said company to said Mas, showing the amount of said prepared or refined oil on hand and the amounts sold, and payments shall be made monthly to Ernest Mas, based on the amount of said oil sold, upon the basis of one per cent on the amount of such sales, as above specified.

In consideration of the foregoing contract, said Ernest Mas hereby waives and releases all claims against the American Glucose Company which he may have under his contracts with said company, dated at Peoria August 18th, 1895, and July 1st, 1896, and said Glucose Sugar Refining Company hereby indemnifies and guarantees said Ernest Mas against any claims that the American Glucose Company may have under said contracts against said Ernest Mas for professional services, processes, or otherwise.

The Glucose Sugar Refining Company agrees to defray all travelling and incidental expenses of Ernest Mas when he, at the request of said company, shall visit Chicago or make a visit of inspection to any of the plants owned by this company in the United States.

This contract is to continue for a period of five years from its date.

In witness thereof the said parties have executed this contract this 27th day of September, A. D. 1897.

THE GLUCOSE SUGAR REFINING COMPANY.
C. MATTHIESSEN, *President*.
ERNEST MAS.

Witness to signatures:

S. T. BUTLER, *Treas'r*.

WASHINGTON, D. C., June 13, 1899.

TESTIMONY OF MR. CLAUS DOSCHER, BROOKLYN, N. Y.

The commission met at 2.30 p. m. June 13, 1899, Senator Mallory presiding. Mr. Claus Doscher, Brooklyn, N. Y., after being sworn, testified.

Q. (By Mr. JENKS.) Will you give your full name and address to the commission?—A. Claus Doscher; 142 Ross, Brooklyn, N. Y.

Q. You have been engaged in sugar refining?—A. Yes.

Q. How long an experience have you had in that line of business?—A. I went into the refining business in 1870, and remained in it until 1887. Since then I have not been active until we built the refinery I am now running.

Q. At what time did you build the refinery you are now running?—A. We began in April, I think it was, 1897.

Q. At what time did you begin operating the refinery so that you could sell the product?—A. The 1st of November last.

THE COST OF SUGAR REFINING AND THE PROFITS IN THE BUSINESS.

Q. About what was the margin of profit on refined sugars when you arranged to build your refinery?—A. When we arranged to build it?

Q. Yes; when you began to build; when you decided to go into business in that way?—A. I can not tell just exactly at that time. Do you mean the margin between refined and raw sugar?

Q. No, I mean the margin of profit.—A. That is hard to tell. The margin between raw and refined was all the way from about 70 to 97 cents a hundred.

Q. How much did you say it was?—A. I do not know exactly, from about 70 to 97 cents on 100 pounds.

Q. By raw you mean 96 centrifugal sugars?—A. That is right.

Q. And of this margin between the two how much is considered the cost of refining and how much profit?—A. Well, the cost of refining is very hard to tell; it depends a great deal on what sugars you are working; the better the sugar the less it costs to refine.

Q. Supposing you have a good grade of sugar, 96 centrifugal, what is the cost of refining 100 pounds?—A. You see there are so many different things that go in. If you can work full, of course you can work much cheaper, but as a rule I should say about somewhere around 60 cents a hundred.

Q. Somewhere between 50 and 60 cents a hundred?—A. As I stated before, it is very hard to tell; one class is cheaper than another; then it depends on how much you can work. If you can work full, of course you can do better.

Q. But if you have a good house, a new house such as yours was, and running full, with a good quality of sugar, you would say that the cost of refining was about how much?—A. Well, as far as I am concerned, as far as our house is concerned, I can not tell that. We have not run it long enough, but that is about the figure.

Q. About 50 cents?—A. About; between 50 and 60 cents, I should say.

Q. What is the margin now between raw and refined?—A. The margin now?

Q. The margin at the present time.—A. At the present time, to-day or yesterday, I believe, it is 51 cents. Since we have been running it has varied, as far as I can remember, from 82 to 51 cents per hundred.

WHY THE MARGIN BETWEEN RAW AND REFINED SUGAR WAS REDUCED.

Q. What reason have you to give for this very great reduction from 70 and 97 cents, when you were building your refinery, to 51 and 32 since then?—A. I have no reason to give there.

Q. You see no reason at all for the reduction?—A. Well, we do not make the prices; that is what you are driving at, I presume.

Q. Who makes the prices?—A. The American.

Q. For what purpose do you think the American Sugar Refining Company put prices down in that way?—A. I could not tell you that.

Q. Have you any reason for thinking that the prices are put down in order to prevent your refinery running at a profit?—A. Yes, I have a good reason to believe so; I have heard a good many rumors to that effect.

Q. Have you ever had it reported directly to you that the officials of the American Sugar Refining Company have said that?—A. By that you mean the officials?

Q. I mean the officials.—A. No, I have not.

Q. You have never heard that any of the officers of the American Sugar Refining Company said that at all?—A. I never heard them say it, no.

Q. That does not answer the question.—A. Then I do not understand your question.

Q. I did not ask you if you heard them say it; I asked you if you had heard that they had said it? Have you heard that? Have you heard that any of the officials of the American Sugar Refining Company expressed the intention of making sugar refining so unprofitable that it would drive you out of the business?—A. No; as I said before, there were rumors and newspaper talk, but I never heard it said.

Q. Have you never had it reported to you that some of the officers of the American Sugar Refining Company said that they would put the prices down until it would be unprofitable for you?—A. Just as I stated before, there were rumors about, and it had been told to me and talked about to me, yes.

Q. I am not speaking simply of general rumors, but I am speaking of it somewhat more directly. I want to know if it has been told to you directly or if you heard that it was said by one of the officials of the Sugar Refining Company?—A. No, I can not say they have. I have heard it time and again, and I was told that they were told direct by the officials that they would do it. I do not know as I ever heard it said myself.

Q. No one ever told you directly that he had heard statements that were made by some of the officials of the company?—A. That is very likely. As I stated before, there has been much talk, but I can not remember it and I do not know where. There are of course a good many rumors, you know.

Q. But you are of the opinion that somebody told you that he had heard some of their officials make that statement?—A. Oh, yes.

Q. So that it came to you with simply one person between one of the officials of the sugar refining company and yourself?—A. No; not by the officials.

Q. I do not mean that; but you say that some person has told you that he himself heard an official make that remark?—A. No.

Q. You said that a moment ago.—A. I did not know that. He had said that a party had said that they had been told that by the official.

Q. That they had heard the officials say it?—A. I do not think I can say that.

Q. You state, then, directly that you have never been told by any person that he had heard any of the officials of the American Sugar Refining Company state that they would make prices so low that you would find the business most unprofitable?—A. Yes; that is right. I never heard by anybody telling me directly, coming to me and saying they were told so by the officials.

Q. Have you been told so directly that the officials made that statement that you believed it?—A. Well, so far as believing it, I do not think that I ought to go on belief or hearsay.

Q. It is part of your oath that the facts you state on opinion and belief you believe to be true.—A. Yes.

Q. And it is accepted here. Of course this commission is simply after general information as to the trust.—A. Yes; that is right.

Q. You have your knowledge direct enough so that you believe it to be true that some of the officials of the sugar refining company have stated that they would make sugar refining so unprofitable that it would drive you out of business?—A. I do not doubt that that has been said, but I can not say that I have been told directly by some party who got it from the company.

Q. Still, you have heard it directly enough so that you believe it is true?—A. I believe that is true; yes.

Q. You believe it is true that with the old margin of profit that existed when you were building your refinery and before prices began to be cut you could have made a good annual interest on your investment?—A. Yes.

Q. About what a rate of interest could you have made do you suppose; what rate were you calculating on making?—A. That I can not tell; that depends upon different circumstances again. But I do know that we could have made a nice profit; there is no question about that.

Q. (By Senator MALLORY.) What do you call a good, nice profit?—A. I can not tell that; what we could have made on the investment is a very hard thing to tell.

Q. Of course you can not get at it accurately, nevertheless you were intending to make a good profit. What, in your opinion, is a good, nice profit?—A. Well, I do not know as I have any opinion there.

Q. (By Mr. JENKS.) Coming back to that other matter, you say that you have heard it said definitely enough so that you believe the officials of the American Sugar Refining Company said that it was their intention to make the business of sugar refining so unprofitable that it would drive you out of business. You said you had no doubt of that.—A. I have no doubt of that.

Q. Have you any doubt, with reference to this further matter, that they also said that if they should make your factory prove a failure, no others would be likely to interfere for a good many years with their control of the business?—A. I have heard that indirectly.

Q. You have heard that the same as the other?—A. That is rumored, the same as the other; yes.

Q. Directly enough so that you have no doubt of it the same as the other?—A. Yes; both of them were the same.

Q. That they intended to drive you out, and that if they did nobody else would afterwards be likely to come into that business for a good many years to come?—A. No; that is a little hard.

Q. That they did not think anybody else would come in for some time to come?—A. Yes; I think that is about right.

Q. Since you started your refinery and began selling have you conferred with the officers of the American Sugar Refining Company with reference to the prices of raw and refined sugars?—A. No.

Q. Any conference with them at all?—A. None at all.

Q. Have you conferred with the other sugar refiners who are not in the American with reference to prices?—A. No.

Q. Not with Arbuckle, or anybody else?—A. No.

Q. Has there been any conference held, or have you conferred with any sugar refiners with reference to the testimony that was to be given here before this commission?—A. No.

Q. There has been no conference of that kind that you know of?—A. No.

NO PROFIT IN REFINING.

Q. Let us come back to the question of refining. Since the prices have dropped as they have, what has been the margin of profit in your refinery? How much per barrel do you reckon you are able to make now?—A. How much profit?

Q. How much profit per barrel?—A. I would say we have not made any, so far as I know.

Q. Has that been true since you began?—A. Yes.

Q. Did this drop in prices come at the same time you began to refine?—A. Yes.

Q. That was in November, 1898?—A. November the 1st, and probably a week after—

Q. And the prices were dropped so low that you made nothing?—A. We have made nothing on refining.

Q. What other sources of profit are there in connection with the sugar-refining business?—A. No others, except in buying raw which happens to advance in price.

Q. Have you happened to have any stock on hand that advanced in price so that you made something out of it?—A. Yes.

Q. In that way you have occasionally had the opportunity to make money on something?—A. Yes; we have been fortunate in that.

Q. Then you have not made anything in the refining business?—A. No.

Q. And you think that the reason the price was put down is that the American wanted to drive you out?—A. I think I have answered that question once or twice.

NO RELATIONS WITH THE SUGAR TRUST.

Q. Have you ever had any conference with the American Sugar Refining Company officials with reference to consolidation of interests with them, or any working agreement at all?—A. No.

Q. Have you ever had any communication with them at all with reference to that matter through third parties?—A. No; nothing at all.

Q. Not with reference to any consolidation of interests or with reference to any working agreement of any kind?—A. No; not of that nature at all.

RELATIONS WITH RAILROADS.

Q. In the shipping of your goods are you able to get any advantages from the railroads beyond published rates, lower than the public rates?—A. Do you mean on the railroads?

Q. You ship a great deal of sugar?—A. Yes.

Q. The railroads have certain published rates of freights?—A. Yes.

Q. Are you able to get any advantages that lessen the cost of shipping to you?—A. You mean from the railroads direct; get a rebate from them?

Q. Well, that is one way.—A. No; we do not get any.

Q. You get no rebate?—A. No.

Q. Do the railroads allow any other privileges, as, for example, any free storage at terminal points?—A. Yes.

Q. They do allow you free storage at terminal points?—A. Yes.

Q. Do they allow this to others?—A. I believe they do.

Q. Probably to all large shippers, you think?—A. I think they do; yes.

Q. Is this free storage worth considerable to you as a shipper?—A. No; I do not think that amounts to much; it is merely accommodation. The sugars are sent there, you know, and held by them for distributing.

Q. At these terminal points?—A. While they are being distributed there is no storage charge.

Q. For how long a time are they held?—A. O, I can not tell you; I do not know.

Q. I believe they count on 30 days?—A. It may be held 30 days; I think that is about right; I do not know, but I think about that.

Q. Do you have a pretty large amount of storage at these terminal points?—A. Sometimes we have.

Q. About how much?—A. Well, we have sometimes, I suppose, all the way from 2,000 to 4,000 barrels.

Q. And they remain there for 30 days or in the neighborhood of that?—A. Yes; part of it would be there for 30 days and part of it would be sent out directly.

Q. But there is a good deal of advantage in having that stored there free for so long a time?—A. Of course it is an advantage; there is no doubt about that; yes.

Q. Have you any information with reference to any division of sugar freights out of New York between railroads?—A. Division in sugar freights?

Q. That is, between different railroads?—A. No; I have no knowledge of that at all.

GENERAL CONDITIONS OF REFINING IN THIS COUNTRY.

Q. In your work in connection with the sugar-refining business, you, of course, have studied not only the cost of refining here, but the cost of refining in other countries as well?—A. No, I know nothing about refineries in other countries.

Q. Have there been decided improvements in the methods of refining in this country?—A. Yes.

Q. Within the last few years?—A. It is further back than that. Naturally there have been improvements all the time, of course, but the great improvements that have been made date further back than that, 10, 12, or 15 years. Of course in manufacturing there is something improved, more or less, from time to time.

Q. Do you think the methods of refining in this country are as good as anywhere, so far as you can judge from competition?—A. So far as I can judge, they are; yes.

Q. You are inclined to think the cost of refining here is as cheap as in foreign countries?—A. I am.

Q. Is there any special advantage in having a large refinery over a medium sized or a small one?—A. That depends upon circumstances again. If you have a large refinery, and can work it full, why, of course, there is no doubt an advantage.

CAPACITY OF REFINERIES.

Q. What is the capacity of your refinery?—A. About 1,000,000 pounds a day.

Q. How many barrels is that?—A. In the neighborhood of 3,000 barrels.

Q. Are there many larger refineries in the country?—A. Yes; some larger I believe.

Q. What ones?—A. The Havemeyer is larger.

Q. What is the capacity of that, about, in barrels?—A. Well, you see, they have so many together—

Q. (Interrupting.) I was thinking of their largest single refinery?—A. The largest single refinery; I can not tell you that.

Q. You say the capacity of your refinery is about 3,000 barrels a day in round numbers?—A. About that.

COST OF REFINERIES.

Q. Speaking in round numbers again, how much did it cost you to put up your refinery?—A. I do not know as that is a fair question.

Q. Is it not?—A. I do not know whether it is or not.

Q. I think that is a fair question.—A. I will tell you. I will put that in another shape for you. You want to know what you can put up a good refinery for. Is that the object?

Q. Yes.—A. If you want to put up a good refinery these days, equal to any in existence, it will cost about \$2 per pound.

Q. Does that mean it would cost about \$2,000,000 for a refinery of 1,000,000 pounds capacity?—A. Yes; that is right.

Q. So to put up a refinery similar in size to yours it would cost about \$2,000,000?—A. It would to-day.

Q. That includes just the refinery itself? You are not taking into account the land?—A. I am taking in everything complete, land, machinery, and everything. Of course the difference would be very decided as to whether the land in itself was worth half a million, as it might very well be if standing in a city or on a remote island.

COST ASIDE FROM LAND.

Q. Now, what would be the cost, aside from the land?—A. That does not figure a great deal.

Q. It figures very decidedly; you had better try to get at that.—A. Perhaps you had better let it go at that.

Q. I hardly think so; it is a very important question.—A. Well, I can not tell you that. Let me see; I can not answer that question.

Q. I beg your pardon; I did not understand.—A. I can not answer that question.

Q. Why not?—A. I am not prepared for it.

Q. You certainly have had considerable experience?—A. Yes.

Q. When you speak of the million-pound refinery you mean, of course, a refinery run at its full capacity?—A. Yes; that is right.

Q. Now, this question of the land is really a very important one, because if the place the refinery happens to be, let us say, in New York City, near the river or on a good dock, it may be, with the land, worth hundreds of thousands of dollars more than the refinery standing elsewhere would be worth.—A. Well, you know you have got to have a river front, so that does not make a great deal of difference. There is no great difference there.

Q. But you have not got to have it in so expensive a place as that.—A. All water fronts are expensive; there is no great difference.

Q. In the neighborhood of New York City they are all very expensive?—A. Yes.

Q. But a refinery built somewhere away from New York City would not be so expensive.—A. That is so. There are other disadvantages there also.

Q. Then the question of taking the land out is really a very important one at the time of capitalization?—A. Yes; I can not very well separate that.

Q. How much land, for example, have you with your refinery?—A. We have close on to 100 lots—between 90 and 100 lots.

Q. What is the frontage of a lot?—A. Twenty-five by one hundred.

Q. And you say you have how many? A. One hundred lots, or very nearly that; between 90 and 100.

Q. Have you some idea with reference to the value of real estate in that neighborhood?—A. Have I some idea?

Q. Yes.—A. Well, I have some idea; yes.

Q. About how much is real estate worth per front foot in your locality?—A. Well, I suppose about \$3,000 a lot.

Q. About \$3,000 a lot?—A. Twenty-five by 100—I think that is about the value around there.

Q. And you have about 100 lots?—A. Yes.

Q. Three hundred thousand dollars for your site?—A. Have you got at it now as nearly as you want to get at it?

Q. So the cost of building a refinery like yours would figure up to, say, somewhere from a million and one-half to a million and three quarters?—A. Yes.

Q. You think it would be about that?—A. Not quite—about one million—that depends a great deal—

Q. (Interrupting.) I said, you know, one million and one-half to one million and three-quarters?—A. Yes; there is a good deal of margin; there is a good deal of margin there.

Q. You think you could for probably a million and one-half?—A. I will not build any more; I have enough at present.

Q. You can for a million and a half equip a full, up-to-date, good refinery of a million pounds capacity; you think that can be done?—A. Yes; I think that is about right; in that neighborhood.

Q. You think you could not build one of that capacity at the present time for a million?—A. No, I do not think you could.

Q. You feel pretty confident you could for a million and one-half?—A. I do not know as I could.

Q. Then, as long as you are not in the building business any more—?—A. That is it.

COST AND PROFIT OF REFINING RESUMED.

Q. You said, to begin with, when you were speaking about the margin between raw and refined sugars, that it was perhaps 50 cents now, and had been 70, and as high as 90 at the time you began building your refinery, and that it had one time been down to a little above 80. Now, if we take the cost of raw sugar and attempt to figure out what the cost of refining is, and what the profit would be, etc., how would we get at it? For example, how many pounds of raw sugar, good quality 96 degree test centrifugal, does it take to make 100 pounds of refined?—A. It depends upon what kind of sugar you are working and also how good you are at refining.

Q. Suppose you have a good refinery and a good fair quality of 96-degree sugar, how many pounds would you allow for making 100 pounds of refined sugar, granulated?—A. Well, I can not answer that question.

Q. Does the United States Government have any calculations on that in connection with drawbacks and so on?—A. I do not know whether they have or not.

Q. The yield, as a rule, is, say, for some grades 93, some 92½, and in that neigh-

berhood. That is, that you get that amount from 100 pounds of raw sugar?—A. Yes.

Q. If you are going to attempt to figure out the cost of refining 100 pounds of refined sugar, you would need to calculate on 107 to 108 pounds of the raw sugar, say?—A. No; I guess it would be the other way. To take 100 pounds would be the handiest way, would it not?

Q. It depends on the matter of figuring; it is immaterial which way you take it. If you take 98 pounds as the amount that you expect to get out of 100 pounds of raw sugar you could figure it in that way.—A. You could figure it in that way; yes.

Q. If you were going to figure the cost of 100 pounds, you would take 108 or 109.—A. Yes; that is right.

Q. What is the price of raw sugar to-day, did you say?—A. The price of raw sugar to-day is \$4.69.

Q. That is, for the 96 degree?—A. Yes.

Q. I suppose that 96 degrees, tested by the polariscope, is a pretty definite thing? This quality, 96 degrees, is about the same always; it is a good quality of raw sugar, and when tested it is always substantially the same?—A. Yes.

Q. So, if you figure on the basis of 96 degrees test it would substantially cover all other degrees, because prices vary in accordance with that test, do they not?—A. Well, as I have already stated, they vary; sugars vary, you know.

Q. What difference in the quality of sugar is there, aside from the question of the polariscopic test?—A. You know, when you take the common sugars they have more or less impurities.

Q. And what did you say the price of refined sugar is to-day?—A. I think it is \$5.20 net.

Q. That makes a difference between the raw and refined of 51 cents, as you said?—A. Ycs.

Q. Now, if we were to add to this \$4.69, which is the cost of 100 pounds of raw sugar, let us say 9 per cent for the value of the amount of raw sugar above 100 pounds needed to produce 100 pounds of refined, making about 42 cents, would that be about fair?—A. I do not know; I do not go into figures; I am not a bookkeeper.

Q. But if it takes, to make 100 pounds of refined sugar, 108 or 109 pounds of raw sugar—of course I do not expect this to be absolutely correct?—A. I do not think they figure that way at all; it is always figured the other way, so far as I know.

Q. It is immaterial; it is a little simpler way of getting at the cost.—A. Yes.

Q. You think that instead of putting the amount of refined obtained from 100 pounds raw at 92 it would be more nearly correct to put it at 98?—A. That depends upon circumstances.

Q. Of course it depends upon circumstances, but I want to get a fair general average. That is as near as we can come to it; 98 you think is more nearly correct?—A. Yes.

Q. On that basis which you have given if we add to the price of 100 pounds raw, \$4.69, 7½ per cent, which would be the amount to be added on that basis, it gives us \$5.04, as the cost of the raw sugar in the 100 pounds of refined. Now if the price is \$5.20, that leaves the margin between the two, 16 cents per hundred. Is that in your judgment below the cost of refining?—A. I have no judgment as to that.

Q. On the basis of 51 cents margin you think there is no money in it to-day?—A. No; I did not say that.

Q. You did not?—A. I said there had not been any money in it on the average. It has only been raised for 2 or 3 weeks. It has never been as high as to-day, you know. It only raised one day last week; I think Thursday or Friday.

Q. There is some money in it on the basis of 51?—A. I do not think there is. I think that is getting about even.

Q. So, then, on this other basis you think the real bare cost of refining must be about 16 cents?—A. No; I did not say that.

Q. It amounts to the same thing, does it not?—A. I do not think it does.

Q. I take your own figures. You maintain that refining will cost 16 cents a hundred?—A. Sixteen cents a hundred the cost of refining?

Q. I thought I was taking that from your figures?—A. You are mistaken.

Q. You said, did you not, that it was a fair average to assume that there were 98 pounds from the 100?—A. Yes.

Q. On that basis you would get, then, 98 pounds of refined from 100 pounds raw; that would give almost exactly 107½, on the other basis; so I take your price of raw sugar, \$4.69, and multiply by the 7½ per cent we put on, and add that to the price of the raw?—A. Seven and one-half?

Q. That is what it would amount to, 7½ pounds, which is to be added to the 100 pounds of raw to make 100 pounds of refined?—A. Yes.

Q. Four dollars and sixty-nine cents multiplied by 7½ gives .85 and a trifle over—.85½; that, added to the \$4.69, gives \$5.04; subtract from \$5.20, the price of refined, and you have left .16. I understood you to say that there is possibly a little bit of money at the difference of 51; the difference there is to-day, which would make according to this 16 cents per 100 pounds, the mere cost of refining, unless you take into account the by-products or something of that kind.—A. There was some surplus.

Q. When you reckon it on this basis, you think we ought to count on the surplus beyond that?—A. Well, I am not up in bookkeeping—I am not up in bookkeeping.

Q. I should judge from your experience that you have given that you are pretty well up in refining?—A. I am not up in bookkeeping.

Q. It would seem to show 16 cents a hundred, and you think that would be a fair cost of refining?—A. I told you that refining costs from 50 to 60 cents.

Q. I know. That is not merely the cost of refining; that includes also the 1c of raw sugar. That is your way of stating the same thing?—A. I have told you what I considered the cost of refining.

BY-PRODUCTS FROM REFINING.

Q. Stated on the basis of the figures you gave me, how much by-product is there in refining 100 pounds of refined sugar; how much sirup, for example?—A. Well, about 2 gallons, I think.

Q. About 2 gallons in 100 pounds?—A. Yes.

Q. How much is that worth in the market?—A. About 10 or 12 cents a gallon.

Q. Twenty cents or more you would say, then?—A. I guess that is too much; however, I can not get at these figures exactly.

Q. Of course from what you have already stated about sugar refining there is more or less variation; but in general you get out of 100 pounds about 2 gallons of sirup?—A. About that; that depends again on the kind of sugar you are working.

Q. That is worth about 10 cents by weight?—A. Yes. I guess it is; you had better not say that; you had better say 12 cents for a gallon.

Q. About 12 cents a gallon; you think that is more nearly correct?—A. Yes.

Q. Are there any other by-products besides sirup?—A. No.

Q. Now, in every manufacturing business, of course, aside from the cost of the plant itself, more or less running capital is required. Speaking in round numbers, about how much running capital does it take to operate a refinery that would melt about one million pounds?—A. If you get credit enough you do not need any money, and if you have not got any credit you have got to have considerable capital, and that again depends upon the stock you are carrying.

AMOUNT OF STOCK CARRIED—AMOUNT OF RUNNING CAPITAL.

Q. About how much stock do you ordinarily carry?—A. There is no rule for that.

Q. Of course, there is no rule; but as a matter of general experience?—A. There is no rule for that at all, not any at all.

Q. There is considerable experience, of course?—A. Yes; but no rule for that.

Q. Of course it is true you would often be very much ahead and often run very low?—A. That is true, and that is something no one can tell, the same as in any other manufacturing business.

Q. There is, nevertheless, a great difference in different kinds of manufacturing as to the amount of running capital that one needs in connection with the business. In some lines of business one needs much more running capital than one does in other lines?—A. Yes.

Q. Now, with reference to the sugar business, does that, on the whole, require proportionately a large amount of running capital or a small amount?—A. Now, I am not acquainted with any other business; I can not tell you what it does require to run any other business.

Q. Suppose I put the question in another form. About how often do you turn your capital in the business; every 12 months?—A. I could not tell you; I do not know.

Q. Can you not give pretty nearly the time?—A. I could not undertake it at all.

Q. On what terms do you ordinarily sell refined sugar?—A. The rule now is that most goods are sold on 7 days.

Q. On 7 days?—A. Yes; 7 or 30 days.

Q. That means that they are to be sold on 30 days and you will give a cash discount for payment in 7 days?—A. Yes.

Q. How much do you give?—A. One per cent.

Q. What are the ordinary conditions of purchasing raw sugar?—A. Oh, there is nothing of that kind given. That is bought right out; that is all straight.

Q. No discount at all?—A. Without any discount.

Q. Cash down?—A. Cash.

A. That is the common custom?—A. That is the custom; yes.

METHODS OF SELLING REFINED SUGAR.

Q. How about the methods of selling your refined sugar, now? Do you have any factors' agreements that in case the wholesaler maintains a certain fixed price you will give him a rebate?—A. Yes.

Q. What are the conditions?—A. The conditions are—you know that, I guess, as well as I do—the factor plan—three-sixteenths and 1 per cent for cash and 1 for trade discount. That is what the factor plan is—what the grocers and the American have had and have been working upon for years.

Q. And you work under the same plan? Do you require, at the present time, any affidavits from the dealers to the effect that they have maintained prices?—A. No.

Q. On the whole, do you think they do maintain them pretty well?—A. Do they maintain them?

Q. Yes.—A. I do not think they do.

Q. You think they cut a good deal?—A. I do.

Q. What is the effect of that on their profits?—A. Well, I do not know.

Q. Who fixes the price for the American market, the New York market?—A. I think I have said that once before.

Q. The American does?—A. Yes.

Q. Are your prices regularly the same as the American prices?—A. Yes.

Q. You let them fix them and then you follow?—A. Yes.

Q. You do not cut first when the prices go down?—A. Never did.

Q. When you first began putting your goods on the market, you put them on at the standing rate that they announced beforehand?—A. Yes.

Q. They began to cut and you followed?—A. Yes.

COMPETITION AMONG THE REFINERS.

Q. Do you know whether there are any other refiners who are not in the American Sugar Refining Company who have cut first?—A. Well, the Arbuckles; they did cut once or twice last winter.

Q. What time did the Arbuckles' refinery begin business?—A. I do not know. It was August or October.

Q. A little bit before you?—A. A couple of months before.

Q. When they first started, did they begin to cut?—A. No; they did not cut, as far as I know, until last winter some time.

Q. The first cut was made about the time you began or a little before by the American, and then some time 2 or 3 months later Arbuckle cut under the American some?—A. Yes; that is right.

Q. How long did they keep holding their price below the American?—A. I can not tell you that. We kept it 7 days. That is all we kept it, but I do not know how long the Arbuckles kept it. We followed the Arbuckles, but we only kept it 7 days.

Q. When the Arbuckles cut, you followed them?—A. Yes.

Q. And then the American?—A. No; we did not follow them.

Q. How much was the cut that was made by the Arbuckles?—A. One-sixteenth.

Q. Then you followed the Arbuckles for 7 days and went back to the American price?—A. Yes.

Q. Then the American followed them down, I suppose, inasmuch as prices kept going down?—A. No, no; that was the lowest sugars were selling all that winter. You know raw sugar had been advancing constantly.

Q. I am speaking of the margin of difference between the raw and the refined?—A. Yes.

Q. That margin kept getting smaller constantly?—A. Yes.

Q. That cut of one-sixteenth did not bring them down to where it is now?—A. Yes; I guess it did. I do not know. I do not remember that. I can not tell you.

Q. I have the regular market quotation. October 1 the difference between the two was 1 $\frac{1}{4}$; October 8 it was three-sixteenths; October 15, three-fourths.—A. That was before we worked at all—before we started.

Q. So this cut began before you started?—A. Oh, no; the Arbuckles' cut was after that. It must have been—I think it was in December.

Q. This cut here was the American's cut, then?—A. What cut do you mean?

Q. In October, 1898.—A. Was there a cut there then?

Q. Yes.—A. I suppose so, if it was then. I do not know; we were not in the business.

Q. There was a cut of from 5 $\frac{1}{4}$ to 5. Are the Arbuckles and the American Sugar Refining Company selling at the same price to-day?—A. I believe they are; as far as I know, they are.

Q. Have they been so in the main lately, say within the last three months. Have the two sold at the same price?—A. I think so.

Q. This difference between them, with the Arbuckles lower, did not last a great while?—A. No.

Q. For a month or two?—A. I do not know whether it lasted as long as that; I can not say.

Q. Was this contest between the Arbuckles and the American only in New York, or did it extend all over the country?—A. I think it was general.

Q. You do not know of any special cuts by the American to drive the Arbuckles' sugar or your sugar out of the market in any special locality? You think that whenever cuts have been made they have been general always?—A. No; I do not think they have; they sometimes varied a little.

Q. Can you give any special instance of their having made a cut in a special locality?—A. No; I can not do that, but they have sometimes. In different parts of the country where they have refineries we were cut off, you know, and not in others. That has been done, but I can not state now where.

Q. When the Arbuckles made their cut, to begin with last winter, did it seem to be because they were short of customers or were they making the cut to get away some special customers of the American?—A. I presume they made the cut because they had too much stock on hand and could not dispose of the goods as fast as they could make them.

Q. Unless they could make some special prices?—A. I suppose that was it.

Q. Is that, in your judgment, the reason why the American has been making these cuts?—A. I can not tell you that.

Q. In the case of a great organization like the American, where several refineries are associated, do you think there is any saving? For example, do you think the cost of superintending the refineries will be lessened?—A. I can not answer that question, because I have never had anything to do with their business.

Q. I was asking you simply in a general way, expecting you to answer from your knowledge of the refining business?—A. I understand, but I can not answer.

PLACE OF PRODUCTION AND QUALITIES OF RAW SUGAR.

Q. Where does most of the raw sugar that you use in your business come from?—A. Well, raw sugars come from pretty nearly all over the world now; a good deal comes from Java, and in fact from all over the world; a good deal of beet sugar comes from Europe, i. e., France and Germany.

Q. As regards the qualities of cane sugar from different parts of the world, is there any special difference that you can detect? For example, where does the best cane sugar come from?—A. Those things all go by tests; everything goes by test; whatever the test is settles it.

Q. You do not know from just what country you get the best quality of sugar?—A. No.

Q. You have all of it bought by test without regard to where it comes from?—A. All is bought by test.

Q. Is there any special difference in value between the cane sugar and the beet sugar?—A. Yes; there is a slight difference.

Q. About how much?—A. I can not tell you what the difference is; there is a slight difference. I am sorry to say I can not tell you.

Q. When it comes to refining, do you get as much sirup out of beet sugar as out of cane?—A. Yes; that depends on what kind they are; but some sirup from the ordinary beets is of a poor quality.

Q. At the present time there is considerable of a tariff on both raw sugar and refined?—A. Yes.

Q. Do you recall how much more the tariff is on the refined sugar than on the raw?—A. No; I can not tell.

Q. What would you say the special evils are, if there are any, that come from a combination of manufacturers such as we have in the American Sugar Refining Company?—A. I can not tell you; I can not answer that.

Q. Do you think there are any evils in a combination?—A. I can not tell you; I do not know.

QUESTION OF THE PROFIT IN THE BUSINESS RESUMED.

Q. (By Mr. FARQUHAR.) Mr. Jenks has asked you a question as to how often you turn over your capital in the course of 12 months?—A. Yes.

Q. Can you not give the commission a general idea of that?—A. I can not give it to you. I would if I could, but I can not do it; I do not know it.

Q. Well, your business, whether on cash or credit, is always inside of 30 days?—A. Supposed to be; yes.

Q. Do you think it would be possible, as a business matter, then, to turn your capital over 6 times in a year, which would give you twice 30 days?—A. I can not answer that; I would have to look the matter up.

Q. Do you think it is a fair question to answer? Would it not have been a fair dividend on the capital employed if, when you went into the business, you had made from 12 to 20 per cent?—A. I do not know that.

Q. I simply said would you take that as a fair business question?—A. No; I do not think so. I believe that in sugar refining there ought to be a fair return for the money. It costs a great deal of money to start. If anything turns up that makes your plant useless for sugar refining, you have got nothing left that is worth anything for anything else. Consequently there should be a fair return for the refining. Of course, you all understand that.

Q. Well, you have a changeable market in your raw products. Do you not think it would be safe to say that a man, in order to invest money in a sugar refinery, ought to have 12 to 14 or 16 per cent assured?—A. I think he ought to; yes.

Q. That is what I wanted. Is it not the business rule in New York, especially in New York and Brooklyn, that you could not get an investment of two or three millions of money in a concern—in a business venture—unless it carried from 14 to 20 per cent profit?—A. I think that is a very good basis.

Q. That is your experience in your own trade, considering the fluctuations of raw material, that you could not make a safe investment unless you were always sure of that amount of profit?—A. I think it is a fair proposition to consider it in that way.

Q. (By Mr. JENKS.) That would be in accord with the general statement you made some time ago. When you started to make the investment in building your new refinery, at the rate at which prices were then, you had expected to get as much return as 20 per cent?—A. I did not make any calculations at all.

Q. You simply believed you would probably get that much if you went on with the business?—A. I did not make any calculations at all.

Q. But you ought to get that much?—A. If you put it that way, yes.

THE DIFFERENT REFINERIES AND THEIR PROPORTIONS OF THE TOTAL PRODUCT.

Q. (By Senator MALLORY.) I did not understand your testimony as to the concerns that are engaged in sugar refining. You have mentioned three—the American, the Arbuckles, and yours. Are there any other large concerns engaged in sugar refining in the United States?—A. Yes; there is the Mollenhauer.

Q. Where are they located?—A. They are located over there in Williamsburg or Brooklyn; that is a large one, and there are some smaller ones. I do not know where they are now. There is another at Yonkers—the National.

Q. Well, of the refined-sugar product in this country, is there any single organization or concern that produces the major part?—A. Yes; the American does that.

Q. The American Sugar Refining Company produces more than your own concern and the Arbuckles combined?—A. More than all the rest together; yes.

Q. (By Mr. JENKS.) About what percentage of the total amount refined is refined by the American?—A. I can not tell you that. I do not know.

AMOUNT OF SIRUP PRODUCED IN REFINING.

Q. There is another question with reference to the nature of the refining that is perhaps not quite clear. Out of a hundred pounds of the raw sugar you said it was a fair average statement to make that we could get perhaps 93 pounds of the

refined, and that also there would be about 2 gallons of sirup?—A. About 12 cents' worth per gallon.

Q. Twelve cents of the value, but I am speaking as to the weight. Do you recall about what the weight of those 2 gallons would be?—A. Two gallons of sirup?

Q. Yes.—A. The sirup weighs about 11 pounds—that is, water and all; that is from the raw.

Q. Well, you have then 93 pounds of sugar and about 22 pounds of sirup which makes about 115 pounds from 100 pounds of raw sugar. There is an addition that comes from the water used in washing the sugar, etc., that adds about 15 pounds to the whole weight; that is right?—A. I do not know whether that is right or not.

Q. Well, according to the figures you have given it comes to that?—A. I can not answer that.

OFFERS TO PURCHASE WITNESS'S REFINERY.

Q. (By Mr. C. J. HARRIS.) I understood you to say that the business had been unsatisfactory since you started the last time?—A. Yes.

Q. Have you ever had any offers from other companies to combine with them or go out of business at all?—A. No.

Q. Either directly or indirectly?—A. There has been a question asked by outsiders whether we wanted to sell, but we always said we did not want to sell out; we did not build the refinery to sell.

Q. I did not suppose it would come directly from any other parties; it would probably be done through outsiders.—A. Well, now, that is something that is difficult to tell, of course.

Q. There has been talk of that kind to you by somebody?—A. They have asked whether we would sell our refinery.

WITNESS FORMERLY SOLD OUT TO THE SUGAR TRUST.

Q. (By Mr. PHILLIPS.) Were you engaged in the manufacture of sugar before the sugar trust was formed, the American trust?—A. Was I engaged in it before the so-called trust was formed?

Q. Yes.—A. Yes.

Q. Did you sell out to the American trust?—A. Yes. I did not sell; we all went in together when the trust was formed; the house I was interested in at that time went in.

Q. Do you own any stock in the trust now?—A. Yes.

Q. Do you own the original amount you put in the trust?—A. No, I do not hold the original amount.

Q. There was no bargain or agreement that you should not go into the manufacture again when you sold out to the trust?—A. I did not catch that.

Q. You did not agree that you would not go into the manufacture again when you sold to them?—A. Nothing of the kind at all was asked or done; everybody was left free to hoe his own row, or do what he wanted to do.

Q. (By Mr. C. J. HARRIS.) If you had not started this competition against the American Sugar Refining Company, do you have any idea that sugar would be selling as low as it is now?—A. I can not answer that question; I think other parties can answer that better than I can; I think other parties would be more able to answer that than I am.

Q. I understand you to say that the decrease in price followed almost immediately after you commenced or started business again; is that so?—A. Well, it was not all in one period; you know the Arbuckles started in before we did; and then the drop started, if I remember right, and went right down all the time.

WITNESS RECEIVES DIVIDENDS FROM SUGAR TRUST, BUT MAKES NO PROFITS IN HIS OWN BUSINESS.

Q. (By Mr. PHILLIPS.) Have you been receiving dividends from the sugar trust since you entered the manufacture yourself?—A. Have I been receiving dividends myself?

Q. Yes.—A. Yes.

Q. Will you please state the amount they pay?—A. They pay 12 per cent on the common and 7 per cent on the preferred.

Q. Per annum?—A. Yes.

Q. Yet you said you have not made any money in sugar since you entered the business. Has the trust facilities for manufacturing by which they can make a profit when you can not make a profit?—A. I can not tell you that.

Q. But still they are paying dividends?—A. They are paying dividends, yes.

Q. And you have not been able to pay dividends on yours?—A. I think I have said here that we have not made any money in refining this year.

Q. (By Mr. FARQUHAR.) Was the last dividend of the trust 12½ per cent?—A. At the rate of 12 per cent.

Q. At the rate of 12 per cent on common stock?—A. Yes, there is one payable now; on the 1st of July.

Q. (By Mr. A. L. HARRIS.) What company did you belong to at the time the trust was formed?—A. The Brooklyn Sugar Refining Company.

DIFFERENT CORPORATIONS THAT WENT INTO THE SUGAR TRUST.

Q. Were you acquainted with the different corporations that went into the original trust?—A. I beg your pardon.

Q. Were you acquainted with the names—do you know the names of the original corporations that went into the trust?—A. I do not know all of them.

Q. Did they operate all of them after the organization of the trust?—A. No.

Q. How many of those refineries were suspended?—A. I could not tell you how many; of course they closed some of them, I do not know how many.

Q. Would you remember them if you heard the names?—A. I will try to.

Q. What became of the Donner & De Castro?—A. They worked but very little; they worked some, but very little after that.

Q. What became of the North River Sugar Refining Company?—A. They did not work at all.

Q. What became of the Oxnard Brothers?—A. I do not believe they worked at all.

Q. What became of the Moller & Sierck?—A. They did not work at all.

Q. What became of the Bay State?—A. I do not know; I can not tell you.

Q. You do not know about the Forest City?—A. No.

Q. Nor the St. Louis?—A. I do not know whether they worked any at all or not; I can not tell you; but those right there in our neighborhood, I know they did not work. They were all old houses and were combined and changed, and, of course, they did not work at all.

Q. (By Mr. PHILLIPS.) How many refineries were closed down when the trust was formed?—A. How many were closed down?

Q. Yes; do you know about how many?—A. I do not know as there was any of them closed down. You mean afterwards?

Q. After the trust was formed.—A. I have said what I knew were closed down; how many more I do not know.

Q. What became of those that were closed down? Were they dismantled?—A. Some of them were.

Q. (By Mr. A. L. HARRIS.) Has the dividend on the common stock been about 12 per cent since the organization of the present company?—A. I think it was 10 until they were reorganized.

Q. When was the reorganization?—A. Some of you gentlemen know better than I do. Was it in 1890 or 1891?

Q. 1892?—A. Somewhere around there; I do not know just when it was.

Q. Do you remember the dividend that was declared in 1894?—A. I am not sure, but I guess it was 12 per cent.

Q. Was there an extra dividend in 1894 of 12 per cent in addition to the 10 per cent?—A. There was one; I do not remember how much; I do not remember the date of it, but I know there was one extra dividend once.

Q. (By Mr. PHILLIPS.) Would you care to state to the commission how much stock you own in the sugar trust now?—A. I would rather be excused.

Q. (By Mr. A. L. HARRIS.) I would like to ask if you know whether or not the Mollenhaur is connected in any way with the American Sugar Refining Company?—A. I can not tell you.

Q. Or whether the officers of the American Sugar Refining Company own stock in the Mollenhaur?—A. I do not know, sir.

Q. (By Mr. JENKS.) Their prices regularly go with those of the American Sugar Refining Company the same as yours, do they not?—A. Yes; they have during the last few years.

Q. Since this last cut in prices they have stopped work?—A. Yes.

COMPARATIVE ADVANTAGES OF REFINERIES.

Q. In the manufacture of sugar are there any special secret processes as there are in other lines of business? Does a refinery of the same quality or grade work the same as every other?—A. Well, about.

Q. There are not supposed to be any secret processes or anything of that kind?—A. No; I do not know that there are. Of course there are always some that have thorough knowledge of the business.

Q. As far as the general process is concerned, with the same managers, they all do the same thing?—A. Yes.

Q. Your refinery is the last one of the large refineries that has been built, is it not?—A. Yes.

Q. So that the presumption is that you have really as good a refinery as any of them, considering its size?—A. Well, I will call it that; let it go at that.

Q. You believe, then, that your cost of refining is really as low as that in any other refinery?—A. I think so.

Q. If you can not make any money from refining, then you think it would be a fair inference that the American Sugar Refining Company can not make any money from refining?—A. I do not know what they can do, and besides that you all know when you start a new refinery that there is so much machinery that you are at a disadvantage in the beginning, and that it takes a little time to get all the machinery and everything running smoothly. So, as I said before, we really do not know what we can do; we do not know how cheap we can run, but still we think, after the affair is started, we will be able to run our own as cheaply as any of them.

Q. (By Mr. C. J. HARRIS.) Is your company a stock company?—A. Yes.

VALUATION AND CAPITALIZATION OF THE SUGAR TRUST.

Q. (By Mr. PHILLIPS.) About what was the value of the plants that went into the sugar trust, the American Sugar Refining Company?—A. I do not remember that, and I do not know that I ever knew. If I did I have forgotten.

Q. What was it capitalized at?—A. It is now capitalized at \$75,000,000, is it not?

Q. Was the addition or increase of capital before or after they bought the refineries in Philadelphia?—A. I think it was before; or did they issue a little more stock? I can not tell.

Q. Was the original capital \$50,000,000?—A. I do not remember; I think it was; I do not remember whether it was or not.

Q. Was it not increased after the purchase of the Philadelphia refineries to \$75,000,000?—A. I am not sure about that; I think it was.

Q. Do you have any idea of the value of the plants that went in at that time from Philadelphia?—A. No; I have not; I never was in a Philadelphia refinery; I do not know what they were worth.

Q. (By Mr. A. L. HARRIS.) Compared with your plant, what would be the average value of the plants that went into the original sugar refining company?—A. Oh, I could not tell you that.

Q. Your plant is a new one?—A. Yes.

Q. And has a capacity of 3,000 barrels a day; and 5 of these which went into the trust you say were old and worthless apparently, leaving of the 15 10 good ones, and you can not say whether their average would be more or less than your new plant?—A. No; I can not tell that.

Q. (By Mr. C. J. HARRIS.) Would 10 such plants as your present plant supply the sugar trade of the United States?—A. No; I do not think they would.

Q. (By Mr. A. L. HARRIS.) When you sold the Brooklyn refinery what was the valuation?—A. Of the Brooklyn?

Q. When you sold?—A. It was in the neighborhood of \$3,000,000; I do not just exactly know, but it was just a little over \$3,000,000.

Q. What was the capacity of that refinery at that time?—A. Now I do not remember just what it was at that time.

Q. Was it not one of the best refineries then running?—A. I believe it was. It was one of the best, but it was not one of the largest; but it was one of the more improved and had the most modern machinery; yes.

Q. It was considered valuable property?—A. Yes, it was.

Q. Was that a cash valuation or stock?—A. Certificates.

Q. You sold for \$3,000,000 in certificates?—A. Yes; a little over \$3,000,000 in certificates; no cash.

Q. At what were those certificates valued at that time?—A. I do not know; some valued them pretty high and some did not.

Q. Were they not valued at 50 cents on the dollar?—A. Well, they had been sold, and were sold for 50 cents afterwards, you know.

Q. Was that not the basis upon which the purchases were made? Do you know anything about the purchase of the North River Refinery?—A. No; I do not. You mean the figures they got?

Q. I mean the one that Mr. Searles purchased.—A. Yes. That was the North River. Yes, if I do not mistake, they took cash; they did not want the certificates, and they took cash.

Q. Do you remember the amount?—A. No; I do not remember the amount.

Q. Was not the offer \$325,000 in cash or \$700,000 in stock?—A. I do not remember that, but I believe that they took 50 cents in cash; I believe they did, but what the amount was I do not remember.

Q. They took 50 cents?—A. I think they did.

Q. It was turned over to the American refinery from that purchase?—A. I suppose it was.

Q. And went into the original sugar trust?—(No audible response by the witness.)

Q. (By Mr. JENKS.) Was that, in your judgment, about the basis of the prices paid in certificates for the other refineries, about double what the fair cash value would be?—A. Well that varies, you know, a good deal.

Q. Do you consider it about that with reference to yours?—A. No; I do not.

Q. You do not believe you got quite double?—A. No; I do not think we got double; I never thought so.

Q. You thought your certificates were worth probably more than 50 cents on the dollar?—A. Well, they are worth a little more today; yes.

Q. (By Mr. A. L. HARRIS.) You have no knowledge of the amount that the Brooklyn company was turned into the trust for?—A. I have no knowledge of what?

Q. Have you any knowledge of what the Brooklyn company was valued at when it was turned into the trust?—A. That is what we were first talking about: a little over \$3,000,000.

Q. I want to correct myself; the amount of trust certificates that were issued for the Brooklyn company?—A. I have said a little over \$3,000,000.

Q. And the capitalization; you have no idea of the capitalization when the trust was formed—that \$50,000,000?—A. No; I have not. I believe, if I remember right, that the companies were all left; they were not changed at all. They were capitalized. I think we were incorporated for \$300,000.

Q. (By Mr. JENKS.) That was before you went in?—A. Yes; oh, long before; when we first organized, you know.

Testimony closed.

WASHINGTON, D. C., June 14, 1899.

TESTIMONY OF HENRY O. HAVEMEYER.

The commission met at 11 a. m., June 14, 1899, Vice-Chairman Phillips presiding. Mr. Henry O. Havemeyer was sworn and testified.

Q. (By Mr. JENKS.) Will you be kind enough to give your full name and address to the stenographers?—A. My name is Henry O. Havemeyer; my address is 117 Wall street, New York; I reside in Greenwich, Conn.

Q. You are president of the American Sugar Refining Company?—A. I am.

Q. Will you be kind enough to make a general statement, in the first place with reference to the subject of industrial combinations, and then we will ask such supplementary questions as may seem desirable?—A. I understood that I would be asked questions on the subject of trusts and corporations, and I have jotted down in a very brief form something I should like to read to the commission. (Reading.)

THE ORIGIN OF TRUSTS.

The mother of all trusts is the customs tariff bill. The existing bill and the preceding ones have been the occasion of the formation of all the large trusts, with very few exceptions, inasmuch as they provide for an *inordinate* protection to all the interests of the country, sugar refining excepted. Economic advantages incident to the consolidation of large interests in the same line of business are a great incentive to their formation, but these bear a very insignificant proportion to the advantages granted in the way of protection under the customs tariff.

There probably is not an industry that requires a protection of more than 10 per cent ad valorem, and it is to obtain what is provided over such percentage in the tariff that leads to the formation of what are commonly spoken of as "trusts."

With a protection to an industry not exceeding 10 per cent, all menace to the

community from trusts would cease. This 10 per cent would represent the difference in cost of production, and likewise act as a protection against surplus products of foreign countries being dumped in our local markets, thereby interfering with the regular and economic working of our industries. Any advantage that might then accrue to such combinations, they would be fully entitled to, and the public would not be damaged thereby, as any expansion of price would be met by foreign competition and relief.

THE TARIFF ON SUGAR.

I have said that sugar is an exception. The rate of protection on sugar is one-eighth of a cent per pound, which is about 3½ per cent ad valorem, and is not the difference in the cost of refining between this and foreign countries. The least it should have is 8 per cent, or, in specific figures, one-fourth cent per pound. The sugar refining industry of this country, no matter what form its organization, is entitled to adequate protection, if any industry is. There are at least 100,000 people dependent upon it. What it pays, or has paid, to its stockholders in the past represents nothing more than a fair return on the capital invested, considering the extent of the business.

The United States tariff bill, in assessing about \$40 per ton duty on imported sugar, pays into the pockets of a few Louisianans on their annual crop, of 250,000 tons, \$10,000,000; to the Hawaiian Islanders, probably represented by 150 foreigners, on their annual crop, of 250,000 tons, \$10,000,000; on say 100,000 tons, produced elsewhere in the United States, \$4,000,000.

Here you have \$24,000,000, extracted from the people of the United States for the sake of getting the revenue, which \$40 per ton on foreign sugar provides. This is merely illustrative of the whole tariff—every line of it—and its effect upon the people. In fact, the tariff bill clutches the people by the throat, and then the governors and attorneys-general of the several States take action, not against the cause, but against the machinery which the people employ to rifle the public's pockets.

THE FORM IN WHICH BUSINESS IS DONE IMMATERIAL.

There appears to be in the public mind a distinction between robbery by an individual and that by a corporation. What is commendable in an individual appears to be dishonest in a corporation.

I maintain that it is immaterial to the public in what form business is done—whether by an individual, firm, corporation, or even trust. These are merely forms of conducting business, or, in other words, machinery for the operations of business. It is the duty of the Government to see that under the tariff laws which they enact, this machinery can not in its actions result to the detriment or impoverishment of the public.

It would have been very easy and proper for the Government to have put a corresponding internal-revenue tax on sugar simultaneously with the imposition of the customs duty, and have these \$24,000,000 which now go into the pockets of a few individuals go into the Treasury for the benefit of the whole people. If no expense of the Government needed to be provided for and protection to American industries was desired, the imposition of 10 per cent ad valorem on all manufactured products would have settled the matter. There is every reason why, if revenue is desired, that with a duty on raw materials of foreign production, a corresponding internal-revenue tax should be levied on similar products, and the protection to manufacturers thereof limited to an additional 10 per cent.

THE GOVERNMENT PLUNDERS THE PEOPLE.

I repeat that all this agitation against trusts is against merely the business machinery employed to take from the public what the Government in its tariff laws says it is proper and suitable they should have. It is the Government, through its tariff laws, which plunders the people, and the trusts, etc., are merely the machinery for doing it.

The statements made before the committees in Congress and the speeches against the Sugar Refining Company are absolutely devoid of truth—utterly unworthy of credence. The intention of Congress, however, to enact something into law contrary to what the sugar refining industry properly required resulted, irrespective of the great injury and injustice done, in the passage of the existing sugar schedule.

PRICES OF SUGAR BEFORE AND AFTER THE FORMATION OF THE TRUST.

Whether the Sugar Refining Company has been a benefit or injury to the community can be best expressed in the table following, showing the prices for a considerable period prior to the formation of the trust and for a corresponding period subsequent. The difference since its formation shows an advantage to the consumer—note that, *consumer*—of over one-eighth of a cent per pound.

[Compiled from Willett & Gray's Weekly Statistical Sugar Trade Journal.]

What the Sugar Company has disbursed in dividends has been not because of any extreme protection under the tariff, but out of conditions perfectly legitimate and commendable. Their records show conclusively that no advantage has ever been taken by the company of any protection in excess of the 8 per cent claimed, i. e., $\frac{1}{2}$ cent per pound, under the tariff.

Tariff laws should not afford protection exceeding 10 per cent to any industry, so that irrespective of the form of doing business, individual or corporation, the people—that is, the consumers, would be protected. As the tariff laws are and have been, it is the consumer, i. e., the great mass of the people, who has terribly suffered, to the great advantage of the few in the business community.

The Sugar Company undoubtedly tries to do its utmost to enlarge its business, but does it in a way, which they consider the only proper one, i. e., by making the price so low as to defy competition.

CORPORATIONS UNDER NO OBLIGATIONS TO THE STATES.

It is my opinion that corporations are under no obligations whatever to any of the States for their existence. Quite the reverse; the States are under obligations to them. If the plants of these industries consolidated were capable of being put on wheels and moved from State to State, you would find very active bidding for them. It is not an unusual thing for certain localities to guarantee free taxation for 20 years, free water, and in some instances give the land to corporations to have them organize under their statutes and locate in their States.

Hostility to capital meets with its own condemnation. This is illustrated by the situation in New York, where discrimination against capital has prevented its employment and driven it elsewhere, resulting in a greatly increased tax rate, and a tendency to increase the number of the unemployed.

CAPITAL AND LABOR.

All I have to say about trade organizations and strikes is that, without violence, they are natural. They have one objection, however—their tendency to reduce all labor to a low level.

Business is not philanthropy. Capital and labor will adjust their own relations if they are let alone. Interference always operates against one or the other; that means to the disadvantage of both.

There is no such thing as monopoly in these days except that which results from patents and copyrights.

The true "communism of pelf" is the customs tariff bill. It says to the people, "Here is the law we have enacted for your robbery. Do not complain of it, but do your utmost to attack and injure the machinery engaged in extracting from you what we legislate shall be taken from you."

"Keep up the clatter while the voters on the tariff bill take advantage of the noise to enact laws that cause your impoverishment and thus contribute to the greed and avarice of the few."

SUGAR PRODUCT OF THE WORLD.

I submit herewith a statement of the sugar product of the world, since 1894, showing the production and consumption of cane and beet sugars, which may be of interest to the commission.

Country.	Estimate.	Actual.

HOSTILITY TO WEALTH.

There is a prevailing hostility to wealth. This is perfectly illogical. Everyone wants money. It is the abuse of money, not its possession, which is opposed to the public interest.

This hostility finds its outlet in hostile legislation, in unequal and unjust taxation. All this is probably unconstitutional. It is directly against the interest of the very class, I mean the poorer class, whom it is supposed to benefit.

Corporations, whether directly such or in the form of trusts, are an expedient for uniting the interests of a large number of persons of smaller means into a large aggregation of capital.

Attack upon them is, therefore, an attack upon their stockholders. In the case of many well-conducted corporations these stockholders are very numerous and are often persons of moderate means, dependent upon their income for their support.

In the absence of all disturbing causes, the direct tendency of a combination of capital is to promote economy, reduce expenses, and diminish price.

This does not mean that a person having anything to sell will not get for it the largest price that he can. It means that with the abundance of capital ready for investment which is always found everywhere, the only way to prevent competition is to keep prices below the competitive point.

Great public improvements, factories, and other enterprises requiring large capital either are impossible unless through the instrumentality of corporations, or are possible only through the action of individuals themselves possessed of unlimited capital. It is easy to see what in the latter case would happen to the community.

One form in which hostile action manifests itself is by legislation which is intended to keep corporations and their products out of particular States. This legislation in some States takes the form of bills which permit citizens to buy goods and with impunity to refuse to pay for them. This is a premium on dishonesty.

In other States the attempt is to exclude articles which are of prime necessity. If the producers of such articles were to follow the lead and to combine to keep their commodities out of the State, it is easy to see what would result, i. e., either the people would be compelled to go without, or they would be forced to pay an inordinate price.

Trade will always take care of itself. If it is left to pursue ordinary channels, A will see to it that B does not have any extraordinary advantages. It is only when the State interferes that a situation is created of which advantage can be taken against the interest of the community.

ONLY TWO FORMS OF MONOPOLY TO-DAY.

In these days there are two forms, and only two forms, of monopoly:

One, that which results from a patent and copyright. It is universally recognized that this is in the interest of, not against, the public.

The other, that which comes from unfair tariff discrimination.

Tariff for revenue need not be considered. The expenses of the Government must, of course, be provided for. Tariff for the purpose of equalizing against foreign bounties or foreign discrimination does not need to be justified. Beyond

that there is no excuse for giving to one industry a protection of 100 per cent as against 4 per cent to another. The result is that the Government fleeces the community at large in the interest of some favored industry.

THE EFFECT OF HOSTILITY TO COMBINATIONS OF CAPITAL.

It must be kept in mind that this is a rich country, not a poor country. It must be kept in mind that the object of everyone is to make the country stronger, wealthier, more important, more influential.

The hostile action to which I have referred, legislation against corporations, if followed to its legitimate results, would make the country less powerful, its people less prosperous, and would destroy the influence which comes from the richness of the land and its people.

Citizens are divided into two classes—the industrious and those who wish to live on the industry of others. It is they who are without capital who are hostile to it. This is only another mode of stating the obvious proposition that it is those who are without means who wish to have wealth without work.

PROTECTION OF 10 PER CENT AD VALOREM WOULD BENEFIT ALL THE PEOPLE.

Q. I should like to ask you some questions in connection with your paper that have a little more direct bearing upon your own special industry. I understood you to say that you thought there should be no tariff above 10 per cent?—A. No protection.

Q. The general principle you have in mind is this, that the difference between the cost of manufacture in foreign countries and this country is likely to be not over 10 per cent?—A. Yes; and the other provision that it is very vital that the industries of this country should be kept constantly going so as to produce at the least cost. There should be no interruption whatever furnishing any opportune chance for dumping the surplus products of foreigners into this country.

Q. You would think, then, that we had better not attempt to take up any industry in which the difference in the cost of manufacture abroad and here is more than 10 per cent?—A. I do not know about that; it would be a very difficult matter to determine what the difference in cost should be; but I favor a horizontal protection of 10 per cent. There is no law that can be framed to meet every particular case, and it is to the advantage of the great body of the people to be considered, and not some particular manufacturer who pretends and can show that his industry is at 15 per cent disadvantage, compared with the same industry in a foreign country.

Q. By making dishonest representations to get legislation?—A. It is going pretty far to say dishonest; I should say that it is of benefit to the whole people that this should be limited to 10 per cent; what the individual suffered would not count.

PROTECTION NECESSARY FOR THE SUGAR INDUSTRY.

Q. As regards your own special industry, I understood you to say you thought a fair tariff would be one-fourth of a cent per pound instead of one-eighth of a cent?—A. One-quarter of a cent per pound, 8 per cent ad valorem; that foreigner—the German—is getting it at 3 cents a pound; and 8 per cent ad valorem would be 24 cents a hundred, one quarter cent per pound.

Q. This tariff of one quarter of a cent would represent substantially the difference in the cost of manufacture abroad and here?—A. That is a little in excess of it.

Q. Could you tell us about what the difference is?—A. I should say the actual difference is between 12 and 15 cents.

Q. Between 12 and 15 cents a hundred?—A. Yes; the difference between the bare cost of refining and living.

Q. Will you outline in a general way wherein that difference lies?—A. The people of this country prefer the sugar in the barrel, which has been the form of package for 50 years. It would be very expensive to change it. It would throw perhaps 50,000 people out of work that are gathering staves and hoops in 15 or 20 of the Western States. The people of the United States are willing to pay that difference. There is only one reason against it, and that is, that the foreign package, the bag, would supplant it, if it came here; because even against the peoples' wishes to pay, the willingness to pay that additional amount for the barrel, the drummers and the wholesale and retail dealers would push the cheaper article and finally drive it out. That is the main cause. The other direct difference is

to be applied on the total expenses; on the other expenses, such as bone black a portion, cartage a portion, and insurance a portion; the wages, of course, enter to the extent of one-sixteenth, perhaps.

Q. In all of these particulars you mention, you think the foreigner has an advantage over us—insurance, bone black, wages, etc.?—A. Yes.

Q. But the difference between them and you, as you have mentioned, is something less than one-quarter of a cent per pound?—A. Yes.

OUTPUT OF THE AMERICAN SUGAR REFINING COMPANY.

Q. May we take up for a moment the question of prices of which you have spoken? You have given here quotations on raw and refined sugar for 20 years, and also the world's output for 5 years. Have you put in your tables the output of the American Sugar Refining Company?—A. No.

Q. About how much is that?—A. About 30,000 barrels a day.

Q. What proportion does that form of the total output of the country now?—A. I have never been able to get at those figures, but I should say about 90 per cent.

Q. You think about 90 per cent of America?—A. That is not of the capacity, but of the output. The fact is that these refineries are not working full.

Q. Does the American Sugar Refining Company itself have a capacity enough to supply the total demand if it were not for the opposition? Your company could easily supply the total demand at the present capacity?—A. The demand, and 20 per cent in excess.

THE PRICES OF SUGAR.

Q. In this table of prices that you have given you show that the difference in price between the raw and refined has lessened since the organization of the American Sugar Refining Company?—A. Yes.

Q. That is the general result. I have had a chart¹ made out here that shows the monthly course of prices from year to year, and I should like to have you comment on it, if you will, inasmuch as that is a simpler way to get at the price, than by taking it from year to year.—A. Well, the price of raw has depended upon conditions over which the American Sugar Refining Company or any other sugar refinery has had no control whatever. The large advance in the last year, 30 per cent, is due entirely to the war with Spain, the sugar crop being reduced thereby 300,000 tons, enabling the foreigners to put up the price.

Q. The American Sugar Refining Company could, being by all odds the largest buyer, have something to do with that, and in some way it does determine what the price shall be?—A. It has some advantages. It can combine different markets, and so, in a measure, offset the control of these exchanges in the world which speculate in sugar.

Q. And by placing large orders with one broker it could probably get a somewhat better rate than a competitor who could place only a very much smaller order?—A. That is only in case the production is very much in excess of the consumption, as it was some years ago. Where it would relieve certain districts of the surplus, they might entertain a lower offer from one man than they would from a majority, or a lot of buyers, the advantage being that by selling it to one man the market price would not be disturbed on the remainder, but in the main it has little or no advantage over others in the prices of the raw sugar.

Q. Now, let us look for a moment at these prices year by year. I think I have made a little clearer here on the chart just what the condition of affairs is than it can otherwise be seen. If we go back some 3 or 4 years before the organization of the trust in the fall of 1887, the difference in price between the refined and the raw, as you have expressed it, is something over seven-tenths of a cent for 3 years, in 1884 a little over nine-tenths, and earlier than that considerably over 1 cent. The trust was formed in 1887 and shortly after prices went up $1\frac{1}{2}$ of a cent, or a little over?—A. The margin; we had better use the word "margin," which represents the difference between the raw and refined.

Q. The margin between the two?—A. That is the commercial designation of that.

THE EFFECT OF COMPETITION.

Q. That lasted for 2 years, then the margin dropped a little, to about seven-tenths in 1890 and to a little over eight-tenths in 1891, as shown here; what was the cause of the drop in the margin there?—A. I think the competition with the Spreckles and Harrison refineries in Philadelphia.

¹ See general introduction. Chart showing prices of sugar.

Q. Those organizations began work in the latter part of 1889?—A. No; Spreckles did, I think, but the other a little later.

Q. And the others came in a little later?—A. Harrison was there; we did not fight him; we could make our dividend without fighting him, but when Spreckles came in with his enormous capacity we either had to fight or make no dividend; we concluded to fight and that is what we are doing now.

Q. When were you fighting against him?—A. That fight lasted in the neighborhood—lasted until we got his refinery—that is about the length of it.

Q. Then in the latter part of 1891 this margin went up to a little over 0.92 of a cent, and in 1892 to a little over a cent, and in 1893 to a little over 1½ cents?—A. Yes; it went up to the usual margin we had laid out as necessary for the benefit of the stockholders and the proper conduct of the business.

Q. Now, that margin ran, with a slight decrease on the average, all the way through, up until the latter part of last year?—A. Yes. I want to call your attention to one thing, viz, that we are exposed to the Louisiana crop which begins to be harvested about the 1st of December, the profit of the sugar business being lowest generally between December, the beginning of the crop, and the 1st of March when that crop is ended, and that then the policy of the business is to increase the margin between the 1st of March and the 1st of December, so that throughout the entire year the average profit, which involves the margin naturally, shall not exceed one-quarter of a cent a pound. That is the course of the business.

Q. That is your general way of doing business. As regards this Louisiana output, is that connected in any direct way at all with the American Sugar Refining Company?—A. No; except that it is a tremendous competitor during those 4 months. Our meltings are displaced to the extent of that crop.

Q. And you lessen your output at that time?—A. To correspond with the crop.

Q. Now, as regards this later drop in the margin, that was caused by what competition particularly?—A. That is the new interlopers, the new refineries. What do you call them—these different refiners? There were half a dozen of them who began active operations, and threatened, if we left them to themselves, to displace our meltings to the extent of 50 per cent.

Q. You mean the Doscher and the Arbuckle refineries?—A. No; he does not "cut much ice" in the sugar business; he does in the roasted coffee business. There are Arbuckle, Doscher, Mollenhauer, and the National, of New York; there is Nash & Spalding, of Boston; McKean, of Philadelphia; Cunningham, of Galveston; Henderson & Cogswell, of New Orleans; and what is known as the Crockett Refinery, of San Francisco. So you see we are in plenty of company.

Q. And all of those put together make, in your judgment, about 10 per cent of the total output?—A. I think they could run out 50, in capacity I mean; there is a great distinction between capacity and output.

Q. In the output only about 10 per cent at the present time?—A. I should presume that. At the end of the year after the official figures are made up I may be able to give you that information, but I have now no way of ascertaining what these outside refineries do.

METHOD OF THE COMPETITION.

Q. Now as regards the cut in sugar: did the cut come in the first place from the American Sugar Refining Company or from the opposition?—A. I am not sure.

Q. I inferred from your expression a moment or two ago, "These 'interlopers' came in," that it was perhaps a part of your policy to see to it that they did not stay in the business too long; something in the same way that you dealt with the Spreckles's opposition in Philadelphia.—A. It was part of our policy and principles. We did not think they could have any advantage in profit over us, and we let them take the results, whatever they may be.

Q. Your policy was, substantially, to put the price down so they would not find it profitable to remain in the business?—A. And to secure the continuation of the output of the American Sugar Refinery, which is very vital to it.

Q. If the opposition refiners were to remain in the business they would lessen the percentage to your stockholders, you say?—A. If they remained in the business and sold the product—two different things again. Every sale by them displaces so much of the American Company's product, and this is what we have to look out for—that they do not.

Q. If you can make it unprofitable to them they will stop their sales, and in the long run the expectation is that the profit will be larger to your stockholders?—A.

That would be the natural inference. Of course it goes without saying if we protect our own meltings it can only be done under a condition of things that makes it unprofitable for our competitors, the real motive being the protection of our own business, and the result being an absence of profit to them.

NATURE OF COMPETITION OF GREAT CORPORATIONS.

Q. In your judgment, is there any difference in the competition that exists between a great organization like the American Sugar Refining Company, with comparatively few competitors, and the general competition that we have in other lines of business where there is no one organization that seems to be dominant? Would you say there is any difference in the principle of competition that exists?—

A. There is not much difference in the principle, but a good deal of difference in the result. You take a large corporation, and its stock is in the hands of the public; the public owns the company; whereas in the case of the individual, he owns it all. I think the public, the seventy-five millions of people, if it chooses to become more or less interested in the American Sugar Refining Company, stands a pretty good chance of knocking out a man who has all his money in one thing.

Q. That is, if the public would buy freely the stock of the American Sugar Refining Company?—A. Yes.

Q. The public own the stock of the American Sugar Refining Company. I suppose they can hold it as long as they hold shares; they can shift it as they please?—A. I doubt if anybody could buy any of the stock of these outside refineries. You can not tell what they will do.

Q. Can you tell us in round numbers how many stockholders there are in the American Sugar Refining Company?—A. Eleven thousand; almost enough to take Cuba, and they would take it if they could. [Laughter.] Of course that is not a part of the minutes.

Q. (By Mr. PHILLIPS.) That is just testimony.

HISTORY OF THE ORGANIZATION OF THE SUGAR TRUST.

Q. (By Mr. JENKS.) The history and organization of the Sugar Refining Company has been gone over so many times in testimony before that it is not worth while to dwell on it at length, but in order that we may have the record somewhat complete, will you give a brief sketch of its development, going back to the conditions of the old sugar trust?—A. There were about twenty-five different firms or corporations in the sugar business. I think the evidence before some one of the Congressional committees was that for a period of 5 or 6 years before the formation of the trust, 18 of those failed or went out of business.

Q. Eighteen out of 25?—A. Not out of 25; 18 out of about 40. It occurred to some one to consolidate the others, and 18 out of 21, I believe, went into the trust, leaving 3 or 4 outside, who represented, I think, 30 per cent. Then Spreckles built a refinery in Philadelphia and 2 or 3 years after the formation of the trust, the trust or its successor bought the Philadelphia refineries.

Q. Will you explain in a word or two the difference between the trust and its successor and the reason for its going into this other form?—A. The trust was attacked, and the courts decided it was illegal, and a company was organized in New Jersey which bought outright and paid for the different companies, which were the constituent companies of the trust. They then represented, I think, over 90 per cent of the output; then other refineries began to be constructed, until now I think they would represent 50 per cent of the consumption.

Q. There has been no change in the American Sugar Refinery proper, so far as the acquisition of other refineries is concerned, since 1897?—A. 1897, I think not.

Q. In the testimony before the New York senate committee, 1897, a list of these different companies with a capitalization is given. The question is whether that list needs to be supplemented to bring it up to date?—A. I think not.

Q. The condition before the formation of the trust was about this: When these 18 different companies failed business was in such a condition, as a whole, that it was considered unprofitable?—A. Very unprofitable—ruinous.

THE ADVANTAGES OF COMBINATION.

Q. Now, can you tell what special advantages—if you can give this in some detail I shall be glad—come from this organization, and in what way you make your savings?—A. The greatest advantage is in working the refinery full and uninterruptedly. Of course, if you have a capacity of 140,000,000 and can only melt

100,000,000 somebody has got to cut down materially. The moment you cut down you increase the cost; by buying up all the refineries, burning them up, and concentrating the meltings in four refineries and working them full, you work at a minimum cost. That enables us to pay a dividend on the common stock.

Q. So the chief advantage in the combination was in concentrating the production and destroying the poor refineries?—A. Precisely.

Q. Are there any other special advantages that come from a large combination of this kind; for example, in the way of transportation?—A. I do not know of any advantage in that way. Under the interstate-commerce act we dare not take a rebate. The Sugar Trust and other trusts are in such odium that they are laying for us fellows so that there would be no escape; there is no advantage in transportation.

Q. Are those refineries all concentrated in the neighborhood of New York?—A. No. There is one in New Orleans and one in Boston, but the rates from New Orleans, except to points almost contiguous, have no advantage over the New York and Boston rates.

Q. So it is simply in the immediate neighborhood of the refineries that you get an advantage in transportation?—A. That is all.

Q. Is the business of sugar refining of such a nature that the general processes, etc., are substantially common to all sugar refiners?—A. Yes.

Q. There is no special advantage that comes from combination in the way of common use of patents or patented processes of any kind?—A. I think no one man knows it all, and if you get a half a dozen men in the business you get ideas from them, and in that way you get a "deadly parallel" on your business.

Q. And you can more probably make improvements?—A. Greater skill and greater ability.

Q. Simply a matter of greater skill?—A. Simply a matter of greater skill and greater ability. One man might have it all, though, in a separate and independent refinery.

Q. Still, in your own opinion———A. My own opinion is, no one man knows it all; all men frequently can learn from others.

Q. Is there another saving to be made in the cost of superintendence, or in the amount of wages paid, from concentrating and running refineries at their full capacity?—A. It is inappreciable. The economy, of course, the cheapening of production, is due to the regular and full work. You can understand, if it costs me three-quarters of a cent to refine full it would cost me one and one-half cents to refine half. That is exaggerated, of course, simply to make clear the advantages of working a refinery full and uninterruptedly.

Q. The question was along a somewhat different line. You probably produce as much in 3 refineries running full as would have been produced in 5 or 6 different refineries without the combination?—A. We produce more sugars in 5 refineries now than 24 before, and naturally the difference in the economy is represented in the profits.

Q. Certainly. It is also true, is it not, that one source of economy would be that you do not need in these 5 refineries so many laboring men as in the 24 refineries?—A. Undoubtedly.

Q. And the benefit of that saving is a general benefit that will be represented partly in profits and partly, perhaps, in the difference in the price of the product?—A. Difference in price in favor of the consumer. I do not lay great stress upon that matter, however, except as a business proposition. We run our business for business, and have attempted to keep prices so low as to defy competition. Unfortunately, we have not succeeded and are in it now up to our throats.

Q. I understood you to say that the general principle upon which you had made prices was that you would take a quarter of a cent profit and give the rest to the consumer?—A. That is it. We felt that any increased profit, even if we could make it—and under the tariff bill we can not make it—would lead to outside competition; we would be inviting competition.

CAPITALIZATION AND VALUATION OF THE SUGAR TRUST.

Q. There has been a great deal said at different times with reference to the capitalization of the American Sugar Refining Company, with reference to the amount of certificates they issued for the different plants, and so on. What was the general principle that you adopted in fixing the valuation of the different plants that came into the organization?—A. Well, we bought the stock at what we could buy it for, which was considered the value, according to what we termed value. I would rather have the brand of a refinery as value than to have a building worth millions of dollars, and that feature which is called good will in the brand was undoubtedly well estimated.

Q. That is exactly the question. I wanted to get at the meaning that you yourself attach to the term "value" in capitalizing the industry.—A. Well, I do not think we thought much of it then—of defining the value of each particular plant. Some plants we bought probably more on account of the real estate value; others we took because they were going concerns; others we took for their standing; others had very valuable trade-marks; all of these things figured in; but how we can separate or divide them I can never tell.

Q. The question was: Would they contribute to the profit of the new organization?—A. Yes.

Q. Then your general basis of valuation was the paying capacity of the plant?—A. You know I know nothing about it except so far as my own plant is concerned. We figured up that our plant was worth so much money and they accepted it, and we have always felt we sold it at an inconsiderable price compared with its real value.

Q. The real value there again being what one could make out of it?—A. Yes; being the value of the trade-mark, the name of Havemeyer as identified with sugar.

Q. As regards the capitalization of the present organization, the American Sugar Refining Company, you would say it is capitalized over its real value?—A. Very much under its real value.

Q. And you get at that in what way, by simply taking the price of stocks?—A. It is my idea that if it was not for this clamor against trusts, and the hostile State and national legislation toward the sugar industry, we could sell it for 2 or 3 times the amount of its capitalization, and I have never found a better estimate of what a thing is worth than what people are willing to pay for it in cash.

Q. The present output is about 30,000 barrels?—A. Yes.

Q. What is the producing capacity?—A. I should say it was nearly 45,000 a day. You mean the capacity of all the refineries?

Q. Yes; that is what I mean?—A. That could be run by the company.

Q. You mean by that that some of them are lying idle? You are not counting any of those that are dismantled?—A. No; only those that are idle and ready to work in case of fire, or any other business contingency.

Q. Can you give us any idea as to what it would cost to build new refineries with that capacity?—A. The mere cost of building?

Q. The cost of building refineries to give you an output of 45,000?—A. I should say from \$30,000,000 to \$35,000,000. Of course the land—that depends on where you build—in New York is very expensive; in Philadelphia it is not so expensive; in New Orleans it is not so expensive, and in Boston it is not so expensive.

Q. In speaking of this thirty-five millions you were excluding the land?—A. No; I took the land in under normal conditions. The latest refineries I understand cost about two and one-half millions each for 3,000 barrels; multiply that by 15 and you arrive at the figure I name; I have no other data.

Q. So as regards the capitalization of the American Sugar Refining Company at the present time, then, in round numbers, \$30,000,000 to \$35,000,000 is about what it would cost to build the refineries?—A. As mere buildings?

Q. As mere buildings?—A. I think the brand of Havemeyer & Elder would bring thirty-five millions alone.

Q. That is the question I have in mind, as to how far this building value should be considered, and how far good will and other matters of that kind?—A. I never separated them. This is the first time that question has ever been put to me, and I have never given it any thought. I do know that when I went in business 30 years ago—you see I am an old-timer—the daily melting of Havemeyer & Elder was 300,000 pounds; now it is over 5,000,000. That will, you see, give you some idea of the value of the brand. There is no other refinery in the universe that has probably increased its product 10 per cent. I would rather have the brand of Havemeyer & Elder than half of the other sugar refineries in the country.

THE COST OF REFINING SUGAR.

The cost of refining has been going down fairly rapidly for the last 2 or 3 years, has it?—A. I do not think it has gone down much.

Q. There has been some lessening in the cost?—A. Relatively the difference between working refineries separately and concentrating them represents almost the difference in cost to-day.

Q. In some of the sugar papers, e. g., Willett & Gray's Weekly Statistical Trade Journal, it was stated that in earlier years when there was a margin between raw and refined of five-eighths of a cent, it would represent the cost, the substantial cost of refining?—A. The cost of refining has nothing to do with the margin; that is

not the margin. The margin is between 96 centrifugal and granulated at 100; the cost of refining is the actual cost of working that sugar.

Q. A statement was made to this effect some 5 or 6 years ago: That when the margin was above five-eighths of a cent it was fair to assume that everything above five-eighths was profit?—A. When the cost was about five-eighths, but not the margin. I want to call your attention to something perhaps you do not quite clearly understand.

Q. The statement was made, I believe, that all the margin above five-eighths of a cent was to be considered as profit, and five-eighths of a cent to be taken as the cost of refining. That was some years ago.—A. That is not so.

Q. That was some years ago. Now, if you will be kind enough to make the statement you were going to.—A. The margin between raw and refined deals with 96-degree sugar, between sugar containing 96 per cent of pure sugar, and granulated, which contains 100. The commercial value of a degree of sugar is 6 cents, and 4 degrees multiplied by 6 is 24 cents; so, for the margin, the difference in sugar, you have to deduct 24 cents. Now, there has never been any cost of refining that I have ever been acquainted with less than one-half cent a pound, and at the time of the formation of the trust it was three-quarters. Now, you have got the whole business. We maintain that when we reduced the cost we were entitled to the profit, and that it was none of the public's business; we took it and paid it out to our stockholders; it may be business policy to share that with the public sometimes; we did not do that then; we have done it since. We had to increase the output; we could injure our competition by reducing our margin. This is business policy again, not philanthropy.

Q. You say you have never known the actual cost of refining to be less than one-half cent?—A. No; I doubt very much if any refineries can do it.

Q. You think, so far as your own company is concerned, its cost of refining is probably less than others?—A. I do not think we are at any disadvantage compared with them; but you must bear in mind that is my individual judgment; I have no means of knowing what they are, so as to compare the two.

Q. Your own estimate, really, is this: When we find the margin at 50 cents a hundred—A. (Interrupting.) Margin at three-fourths.

Q. I was going to say that when we find the margin at 50 cents a hundred the refineries are running at a loss?—A. Yes; that is a fair inference.

Q. When we find a margin of 75 cents a hundred, presumably—A. (Interrupting.) Oh, then it is beneficial. Excuse me—the margin at 75—there is no great damage done then.

Q. Probably some profit being made?—A. Not unless everything is working in concentrated form in the very best manner.

Q. When the margin between raw and refined sugar, then, stands at 50 cents a hundred, or lower, dividends can hardly be paid out of profits?—A. Not out of profits resulting from such margins; no.

THE QUESTION OF TRANSPORTATION.

Q. That is a fair inference, of course. Now a question or two with reference to freights. You say that under the interstate-commerce law the question of rebates is one that is not to be considered. Do the railroads give the larger shippers of sugar any advantages beyond their published freight rates in the way of storage, for example, at terminal points and such places?—A. I am not very familiar with that, but I imagine they give the ordinary business facilities; it is a high note when a railroad can not give its patrons storage or anything else.

Q. I understand that is the custom. I wanted to ask you what the custom was.—A. I wish they would give them a barrel of sugar; it would increase the demand and lower the price. The practice in former years was to give us such facilities as they had; if their stores were empty, or it happened to be a lively sugar season, and sugar would go there, and it was convenient to the trade, they naturally gave us such accommodations as they had. They never built any storehouses for us; but since some of these outside warehouses have been kicking about it, the facilities, I believe, have been very much restricted.

Q. Is there any allowance of any kind made for the amount of sugar shipped?—A. No. That is all done away with.

Q. They substantially go at carload rates?—A. Altogether at carload rates.

Q. Can you give us any definite information with reference to the amount of sugar shipped over the different railroads going out of New York and Brooklyn?—A. I can send it to you.

Q. We shall be obliged if you will.—A. That is done under agreement.

Q. Will you explain the nature of the agreement, please?—A. To protect

ourselves against these companies, we had to agree that we would give the railroads—that is, the entire sugar industry would give the railroads—each a certain percentage of sugar which had been determined by the commissioner there (whoever he is; some commissioner has it in charge), and they fixed the percentage that each road was entitled to. I think they took the 5 preceding years' business as a basis, and determined in accordance with that the share of each; that ended all this disposition to cut, and I do not think there are any cuts whatever on sugar.

Q. Now there is a certain percentage sent to each railroad in accordance with this agreement?—A. Yes.

Percentage of sugar freights.

[Furnished by Henry O. Havemeyer.]

	Per cent.
New York Central and Hudson River Railroad	30.59
Erle Railroad Company	28.51
West Shore Railroad	12.83
Lehigh Valley Railroad	14.47
New York, Ontario and Western Railroad	3.15
Central Railroad of New Jersey	3.80
Central Vermont Railroad	3.60
Chesapeake and Ohio Railroad	3.75
Total	100.00

DIFFERENCE IN MARGIN IN DIFFERENT PARTS OF THE COUNTRY.

Q. Is the margin between the 96 centrifugal and the refined sugar substantially the same in New York that it is everywhere else in the country, or what is the difference in different sections of the country?—A. The price is the same in all other manufacturing centers as it is in New York; in New Orleans it is a little higher.

Q. I was going to ask in reference to California?—A. They are in a row over there, and their margin is less; heretofore they have had at least half a cent a pound protection in freight over the Rocky Mountains, which has naturally accrued to them as refiners when no competition existed. Now they have competition by outside refineries, and I believe competition is even worse there than here.

Q. What interest has the American Sugar Refining Company in the California refineries?—A. They own a one-half interest in the Western Sugar Refinery, the other half being owned by Spreckles.

Q. And who owns this new one?—A. Some of the Hawaiian planters; they were dissatisfied with the price obtained for their sugar in San Francisco, and built a refinery.

Q. Does the American Sugar Refining Company have any interest in the production of raw sugar? When I say interest, I mean financial interest, of course. Does it own sugar plantations, and so on?—A. They have some interest in California.

Q. The question was suggested by your remark about Cuba.—A. That is a matter of patriotism; I suppose I ought to have qualified that. Cuba is a country that can supply the United States entirely with their sugar in 3 years, and it is a great pity we do not have it and have sugar at 2 cents a pound instead of 5, which we are paying now. That is, if we could have raw sugar coming in from Cuba free, without tariff, we could sell it at 3, and have the raw at 2; it would have to be refined.

AMERICAN SUGAR REFINING COMPANY AND THE COFFEE BUSINESS.

Q. There has been considerable said in the last 2 or 3 years with reference to the American Sugar Refining Company going into the coffee business.—A. They are in the coffee business, and in it to stay.

Q. Will you explain the circumstances under which they went in and what the effect upon the prices of coffee has been? You just expressed the opinion that you were in it to stay.—A. A going concern at Toledo was offered to the firm of Havemeyer & Elder—a going coffee concern; they bought it; and when it was clearly established to the directors of the Sugar Company that it would be an advantage to them to own that plant they bought it from Havemeyer & Elder. When Havemeyer & Elder bought that plant green coffee was selling for 10 cents a pound and roasted coffee was selling for 15. Those who had the management of the business told me that the production of coffee would in the next few years be on such an enormous scale that I had better keep out of the coffee market as much as possible. Of course, having the plant, it had to be run; we could not

close it up. We would lose our brands, lose prestige, and lose business, so we immediately dropped the price to the difference between the cost of roasted and green coffee. The cost of roasting, which was 3 cents, plus the cost of green, made it 13; so we immediately gave the consumer the advantage of 2 cents a pound. This was a gain for business reasons. I want that distinctly understood. It is now worth 6 and not long since dropped to 4, and roasted instead of having a margin of 3 cents a pound has now only 2½, so that the benefit the consumer gets is a price of 8½ as against 15. How much of that is chargeable to the operations of the Woolson Spice Company in protection to its business on business principles you can form your own idea. I do not think the fight has begun yet, if there is going to be one in the coffee business. We are trying to avoid it by making a better grade of coffee and by getting it out of the category it was in. We are trying to be in a field distinctly by ourselves, the same as we are in sugar.

Q. When you lowered the price in the first place, was the reduction made because you thought there would be more money in extending the sale than in keeping the price where it was before?—A. We were afraid of the raw market, and having to run the plant we had to get rid of the product as soon as it was made, and the only way I knew to do it quickly was to make it desirable to the consumer, and so we put prices down to actual cost. We were held up by a judge for 3 months on a suit by Arbuckles, but after that it began to drop gradually until now it is 8½.

GLUCOSE SUGAR AND THE PRODUCT OF THE SUGAR TRUST.

Q. What is the relation, if any, between glucose sugar—I am speaking now of the product—between glucose sugar and the product of the American Sugar Refining Company? How far does that come into competition, if at all, in the market?—A. The sugar itself does not come into competition at all, but the sirup made from glucose has virtually knocked out the consumption of refined molasses in this country; they buy it in preference.

Q. What are the special uses to which it is put?—A. Table consumption and confectionery of all kinds, and they use it in the preparation of malt, I believe, for brewing purposes.

Q. So it comes in as a competitor with the sirups produced by the Sugar Refining Company?—A. With the residuum of the Sugar Refining Company—molasses.

Q. Has the American Sugar Refining Company any interest, directly or indirectly, in the Glucose Sugar Refining Company?—A. None whatever.

Q. Have you, personally?—A. No; I had a little interest at one time, but I sold it out.

Q. So at the present you have none in it?—A. I may have 100 shares, but not over that.

THE MEANING OF MONOPOLY AND THE EFFECT OF GOVERNMENT INTERFERENCE.

Q. You expressed an opinion in your paper with reference to the inadvisability of legislation for the regulation of business, and immediately afterwards with reference to the nature of monopoly. Have you thought about the matter definitely enough to give us a definition of monopoly?—A. I do not need to give you my own because I am irresponsible; it has been declared by the courts that there can be no monopoly without restriction, and if there is no restriction there is no monopoly. I have a perfect right to manufacture, to sell, and to conduct a business which represents a particular article or any article in the United States; and there is no reason why I should not, and there is every reason why I should. I say "hands off" to the Federal and State governments just the moment they interfere with the control in any way, shape, or manner. They increase the cost to the consumer in my opinion. He is the important factor; I do not think the middleman or anybody else counts a snap of your finger compared with the great mass of consumers.

Q. In speaking of "restriction," in the legal definition of monopoly which you have just given, did you have in mind any particular legal restriction? You would not consider it a restriction if, by virtue of the fact that you control 90 per cent of the output of sugar, you practically fix prices for the other producers?—A. No; anybody can go in the sugar business that wants to.

Q. Suppose, for instance, these competing sugar refineries were put on this table to take in. You would not take them in?—A. I would take them in pretty quickly, and get out of them all I could. As long as I do not restrict, or the Government interfere with them, anybody can get into the business. Why is not that a good business proposition? What is harmful in it? That is the way business

has been done from the year one, and always will be. Just as long as you interfere you increase the cost, and that is a detriment to the consumer.

Q. It seems to have been the result of the sugar business the last 12 years that during the 3 years that competitors have tried to get in the prices have been lower to the consumer to a considerable degree than would have been the case if you had not had such vigorous competition.—A. Undoubtedly. Furnishing the consumer at a less price is not the only evidence of business. You have got to take care of yourself, and that is quite an important matter. We are doing that now and the consumer gets the advantage; every time it is the consumer.

Q. If you succeeded in the course of the next year in taking up those refineries, as if they were on the table, as you say, then the consumer would be likely to feel the effect of that in the other way, I suppose?—A. To the extent of a quarter of a cent, sure.

Q. You expect to limit to a quarter of a cent?—A. Yes; I think under the tariff bill we should not have an opportunity to increase it. There is this distinction of doing business on legitimate grounds and doing it under a tariff bill which permits you to fleece the people.

Q. With the tariff we have you can not go beyond that?—A. We can not; but we have been singled out and injured under this clamor that you must do something for somebody; so we have been injured while you are dealing out some of the "swag" to others. That is it; you can not dodge it, and the people are getting on to it.

EFFECT OF REMOVING THE TARIFF.

Q. Suppose the tariff on refined sugar, the differential, should be removed, what would be the effect?—A. It would kill the sugar industry.

Q. You think if this differential were removed—A. It would inflict a terrible and infamous wrong upon 100,000 people dependent upon it. It is merely truckling to a miserable clamor—a bugaboo—this babble about trusts.

Q. Will you be a little more specific as to the way in which it would affect them?—A. It would permit America to be the dumping ground of all the beet sugars of Germany, Austria, France, and Russia; it would reestablish the sugar-refining industry of Great Britain, and everything would go to them in the way of labor to supply to 70,000,000 people over 2,000,000 tons of sugar, and it would be taken out of 100,000 people that are living upon it to-day. It would be simply an infamous atrocity.

Q. You think the sugar industry is practically dependent upon this one-eighth of a cent differential?—A. It is indispensable. Let there come the slightest cause for any interruption in the refining business here so that prices advance, and we would be inundated at once with foreign product, because one-eighth of a cent is inadequate; we ought to have one-quarter. One-eighth is not what we ought to have.

Q. It is only what you could get?—A. No; it is getting something we do not want to have. That was the object of the law.

THE CAUSES OF MONOPOLY.

Q. (By Mr. PHILLIPS.) Speaking of monopoly, if I understood your paper, you attribute monopoly or trusts to two causes; first, patents, and second, tariffs. Did I understand it correctly?—A. Yes.

Q. That they were the outgrowth of two causes, patent rights—A. (Interrupting.) Yes.

Q. (Continuing.) And the tariff levied by the Government?—A. Yes; practical monopoly, not legal monopoly.

Q. Well, now, the Standard Oil Company Trust is admitted, is it not, to be one of the largest that has ever existed?—A. I said with few exceptions. Of course, anything that depends upon the tariff; the Standard Oil Company has not anything to do with the tariff; you read the tariff bill, and you will find that there is no tariff on oil.

Q. That is what I am getting to?—A. I said the tariff.

Q. You said due to two causes, patents and the tariff?—A. Yes.

Q. Do you not understand, or do you, that the Standard Oil Company has never been affected in any degree by tariff, and yet it is one of the greatest monopolies of this country or any country?—A. My dear sir, you are entirely off on the subject of monopoly. A monopoly is something which is carried on, or may be carried on, without competition. The oil business is open to the world; it is open to every

citizen of the United States, and the reason they can not go into it is because the Standard Oil Company makes the price so low that it smashes them, and gives the consumer the benefit of it. You have got to take either one position or the other. The consumer is the man to be considered (and the consumer means the great mass of the people, the 75,000,000 people), because he gets the benefit of the cheap goods, and the more because he gets the advantage when the competition is wiped out, and very properly wiped out.

Q. Then you understand that the reason why the Standard Oil Company has become so prominent in monopolizing the oil-trade is because it is able to manufacture cheaper than others. Now, if that be the case, why have they bought out or crushed out all refineries, all pipe lines thus far, with a view just now of starting in to do business. If you take their own dividends as a basis you will find that they are making an exorbitant profit; for instance, oil is selling at a little over a dollar a barrel now, and very frequently for less than \$1, and is it not shown by the Standard Oil Company's own dividends that they have been making, for the last 10 or 15 years, more profit on each barrel of oil than they have been paying for it?—A. You are confounding profits with monopolies. What is the reason I can not own a gold mine with a million dollars in it? It is all mine. I am undertaking to meet the proposition that you made by saying that the Standard Oil Company make refined oil cheaper. That is the reason why they dominate trade.

Q. Do they make profits because they make oil cheaper, or because they purchase their rivals, circumscribe, circumvent them in some way?—A. That is all business. What do you call the brand of Havemeyer & Elder? You start a refinery and it costs you \$10,000,000. Somebody loans that ten million dollars, let us say; and Havemeyer & Elder, to protect themselves, put down the price of sugar and say to them: "You can not market a barrel of sugar while that brand of sugar is being sold."

Q. Do you think that the Standard Oil Company, if the markets had been opened to the world, to the people, if they had not monopolized the pipe-line business and dominated legislation and got a reduction in freight, got discriminating rates, they could have dominated, as they have?—A. I think that before the interstate-commerce law went into effect the Standard Oil Company had advantages which they should not have had, but that is ancient history; they are here to-day; they go right from the fields to the consumer; they furnish oil cheaper than it can be furnished by anybody else, and that is to the benefit of the consumer. It is to the absolute annihilation of the middleman or anybody else in the oil business, in my judgment, and if it goes into the pockets of the few people it is perhaps so much to be regretted; but there is where it goes, and likely it would be very nice to have them divide it. But until you find what Carnegie is going to do with his millions I do not think you can get the Rockefellers to tell what they are going to do with theirs. They have got it.

Q. Now, you said that they are here; is not the reason they are here because they can do things cheaper? I undertook to say that there no persons engaged in refining, shipping, and transporting oil abroad and at home, who are making a very large profit, but that could make a much larger profit if they had the same facilities and markets open to them as are to the Standard Oil Company?—A. I dare say there is a field at present with the competition of the Standard Oil Company, but if it ever got momentous I think the prestige, ability, and great wealth of the Standard Oil Company would knock it out. I may be wrong; I am talking about something I do not know much about.

COUNTRY WOULD BE BETTER OFF WITHOUT THE AGITATION ABOUT TRUSTS.

Q. (By Mr. C. J. HARRIS.) Do I gather from your remark that you think it is a pretty good idea for all competitors to be knocked out but the one that controls the business?—A. That is trade and you can not alter it, and the Federal Government can not alter it, and the sooner you realize it and stop the talk about it the better off the country will be in that respect.

Q. What we are trying to get at is whether it is better for the country. We want to know whether that is a good state of affairs to have?—A. Take the price of oil: Do you suppose it is better for the country of 75,000,000 of people to have oil 2 cents cheaper or to establish half a dozen competitors in the business who are in it for the same amount of gore that the Standard Oil Company is, and who increase the price? That is like what we had in sugar. You stop here the work by giving \$24,000,000 in tariff on sugar to have a number of people in Louisiana and a few people in Hawaii employed, and see where you are.

AMOUNT OF PROTECTION NECESSARY FOR ALL INDUSTRIES.

Q. I judge from your essay, and I should like to know whether I am right or wrong, that you are against protection, except that extended to the sugar trust. Am I right?—A. No; you are all off.

Q. I should like to have the secretary read that part of the essay.—A. Suppose you allow me to state it; it will be much briefer. I said I did not think any of these industries ought to have over 10 per cent. I thought more was inordinate, because it allowed these combinations of capital to fleece the country. I am in with you for protection every time, but I limit it to 10 per cent; I draw the line at 10 per cent.

Q. Is that because 10 per cent fully covers you, or because you think—A. (Interrupting.) Eight per cent would cover me; I so expressed it in my paper.

Q. I think that has been brought out before, that industries the same as your own were not in need of more than 10 per cent. The same principle would apply to them that does to you. I understood you to say that unless you had protection the refining industry would be driven out of this country. Is that so?—A. True.

CAPITALIZATION OF THE SUGAR TRUST RESUMED.

Q. The capital stock of the American Sugar Refining Company is \$75,000,000, is it not?—A. Yes.

Q. It has not been increased since those figures were published?—A. No.

Q. What is the output of refined sugar in the United States?—A. I do not know.

Q. It was estimated at some 3,000,000,000 pounds a year or two ago?—A. That is right.

Q. I think you estimated it here at 200,000,000 barrels a while ago, did you not?—A. I said the present output was about 30,000 a day; that is not so all the year around.

Q. We have had testimony in our hearings which would lead us to believe that ten refineries, at a cost of a million and a half dollars apiece, which would be \$15,000,000, could supply the refined-sugar demand of the United States; that the capital to run those would not exceed ten more millions, which would be twenty-five millions. Now, if the consumer is to be considered, and he is the main factor, I would ask you what the consumer gains by paying the American Sugar Refining Company on a capitalization of \$75,000,000 if \$25,000,000 will do the same business?—A. If those premises are true—and they are not—you would find that the fellow that made that statement would want about 50 per cent on his stock instead of 12 per cent. I do not think the man who made that statement is absolutely correct; I do not think he would be content with 20; he would want 50; I do not know of any advantage to the consumer. With my knowledge of sugar refining, the cost of it and the capital required, no such thing could be done.

EFFECT OF COMPETITION ON THE CONSUMER.

Q. Is it for the benefit of the consumer that prices are temporarily put down when competition enters the field until you can crush out that competitor, as I gather from your testimony? Is it for the advantage of the consumer if, when that competition is crushed out, you put up the prices immediately thereafter to such a margin of profits as will cover all these expenses and others—that is, the expenses of the fight, the wear and tear, the buying out refineries, and all that? I would ask you if that is for the benefit of the consumer?—A. Well, I do not know. You would have to find out what the figures were in order to determine whether it was just or not. I think the consumer would have to be subject to such a condition of things if it was a trade condition.

Q. I ask this because you have, in your testimony, laid such stress upon the interests of the consumer.—A. Do you think by lowering the prices merely to crush out the competitor, as you put it, that the consumer is not benefited?

Q. I say he may be benefited temporarily for 6 months or a year; but if after the crushing out has taken place you then, as you said in your testimony, resume a margin of profit which you consider is the right thing, and that is the only thing you are governed by, I ask you then whether the consumer will be materially benefited or not?—A. Is he not benefited to the extent of the reduction of prices during the fight?

Q. He is; but if he has to pay double or three times the price after the fight is ended I fail to see where he is benefited?—A. He is not, if he has to pay that.

Q. I understood you to say when the war was ended you evened up?—A. Yes.

Q. The price you put on was for the benefit of the stockholder?—A. Yes.

IT IS FAIR TO GET ALL OUT OF THE CONSUMER POSSIBLE.

Q. (By Mr. FARQUHAR.) Did you state here that 90 per cent of the whole product of this country could be produced in factories that cost \$35,000,000?—A. I think so.

Q. Now, your own capitalization is \$75,000,000; I presume as a business man you would say that the difference between \$35,000,000 and \$75,000,000, or \$40,000,000, is good will, brands, and all that sort of thing in your business?—A. You are making statements that are backwards. I did not say that the \$35,000,000 were required actually to reproduce the refineries that are already a part of the capital of the American Company; I said we took in 18 plants, the cost of which, together with the good will, brands, and such things which we can not divide into the separate accounts, which I have no way of doing, did represent this \$75,000,000.

Q. Well, say it was fifty millions; even it up. That leaves \$25,000,000 which seem to stand for good will, brands, etc. Do you think it fair that the consumer should pay a dividend to your company on these brands, good will, etc.?—A. I think it fair to get out of the consumer all you can, consistent with the business proposition.

Q. You state that as an ethical position before the commission, and you have to stand on that ethical position for fair play. Now, I want to know if you think—you stated that the consumer received the benefits of this consolidation of industry—it a fair ethical proposition, independent of the business view you put on it, that the consumers should pay dividends on this \$25,000,000 of over-capitalization?—A. I do not care two cents for your ethics. I do not know enough of them to apply them.

Q. Well, as a business proposition, is it right?—A. As a business proposition, it is right to get all out of business that you possibly can. If you get too much of a profit, you get somebody in competition. What I object to is a tariff bill which allows these consolidations to mulct the public through them.

GENERAL EFFECTS OF THE TARIFF.

Q. Well, take your position on the tariff bill where you talk about 10 per cent differential: would a 10 per cent differential have brought the tin industry to this country?—A. Well, if it would not, the country would have been better off without it.

Q. But, would it have brought it? Do you know?—A. I do not.

Q. Would it have brought the glass industry to this country?—A. I would like to have proof to the contrary before I would say it would not.

Q. (By Mr. FARQUHAR.) Do you take into account, as an American—you say you are a protectionist, whatever may be your views of protection—that in making the tariff bills in this country or in making any impost legislation we have to take into consideration two great facts, first, the wages paid to American workmen, and secondly the interest on American money? Do you know of any industry in this country that 10 per cent ad valorem ever created—any one—even to the making of tacks?—A. Shall I be perfectly frank, anyway?

Q. Yes.—A. How about steel rails? Steel rails were exported at the time the steel schedule was under discussion; they were being sent to England and Scotland. They can be produced for \$15 a ton; they are worth \$24 a ton; now the reason they are worth \$24 a ton is because the people under the tariff are mulcted for the difference. I am not talking about things that are ancient history; I am talking about things that exist. I am not talking as to whether 100 per cent was necessary or not; I am talking about the effect of the tariff to-day, which is the mother of these trusts which are mulcting the people, and there is not a line of it free from this abuse to-day.

Q. Why not make an open proposition to abolish the tariff on all sugars? Why would not that be a good thing?—A. Why is it not right and proper that the American sugar industry should have 10 and 15 per cent where you are giving others 50 and 100? Why this outrageous discrimination?

Q. Has not your trade been sufficiently protected under the tariff?—A. No.

Q. Why?—A. Because we only get one-eighth and need one-fourth. Where is the rule of ethics that you were talking about that gives you 140 per cent and 144 per cent on some industries and cuts the sugar industry down to 8 and 4?

Q. Do you recollect what the price of steel rails was before the tariff was put on at all?—A. I do not know what steel rails were. I have got Carnegie; I can quote him to the effect that he could export steel rails to any part of the world. What did he want a tariff for?

Q. Is that possibly a natural result of previous protection?—A. Oh, yes, of protection; I am with you there every time, but not inordinate protection, nor are you in favor of that I believe.

THE CONDITIONS OF LABOR.

Q. You made one queer expression—a remarkable one—in your essay here. Speaking of strikes, you say that they lead to a low level. What do you mean; do you mean a low level in economic conditions, social conditions, wage conditions, or what?—A. Oh, I think it takes the independence out of a man. He can not work for less than what the trade union prescribes. He can not be his own master in anything. That is rather a wide subject; I do not want to pursue that.

Q. (By Mr. KENNEDY.) Does not your combination take a good deal of independence out of competitors who were pretty independent previously?—A. You bet we do. But where a man's necessities are so great that he is willing to work for \$1.50 a day, he can not do it because the trade union tells him not to work for less than \$2. I do not want to go into this subject. I have touched it very briefly, but I would rather have it passed. I do not think trades unions are an advantage to the working class.

Q. (By Mr. RATCHFORD.) If a combination of the laborers of the country is not an advantage to the laborers, wherein or how can it be an advantage to the capitalists of the country to combine and to the country to have them combine?—A. I did not say they should not combine. I have not reflected upon labor. I am perfectly willing to leave labor to its own devices.

Q. Nor have I understood you to state that; I simply asked you wherein is the advantage or the disadvantage to labor.—A. They certainly have very materially increased their earnings under combinations.

Q. Then it must be advantageous?—A. As long as this combination or consolidation of capital continues under the tariff I would go in for a consolidation of labor.

Q. (By Mr. KENNEDY.) Did not you reflect on trade unions very seriously when you said they pulled labor down to a very low level?—A. Perhaps that was an unpleasant way to put it, but I really do not see that these labor unions are any particular advantage to the laboring class. It certainly confines a man to do just as it is mapped out for him to do; he is not a free worker or an independent man in any manner, shape, or form; and he is whistled out at the dictation of the few men by whom he is controlled; and it is extending now in these affiliated interests. You see it is a very wide subject, which I should prefer to drop and expunge it from the paper.

Q. (By Mr. PHILLIPS.) But does not the organization of capital compel the organization of labor in order that they may meet on equal terms? Otherwise one dictates and the other submits.—A. Undoubtedly.

Q. How can that be done except through trades unions?—A. I do not believe it can. I have already stated that labor, to protect itself, has got to unite, form trades unions; has got to consolidate, or I believe that these corporations would run them out of existence. There is no doubt about it.

Q. (By Mr. KENNEDY.) That being so, then how will this organized labor bring other labor down to a very low level? If they have to meet it, it is a good thing for them.—A. Where a man is not independent, where he can not act, if his family is suffering, he can not do it. Where the need of work is absolutely required for him to meet his monthly expenses he may be whistled out for 29 days out of 30 by a board of delegates. It is a very serious question, but I would rather you would not question me about it; I would rather you would expunge the whole matter.

Q. Do you not believe in organization when you go into a directors' meeting?—A. I do; but when I go into a board of directors' meeting and do not like it, I get out. A poor man is not exactly in that status.

Q. A laboring man can do the same thing?—A. No, he can not; because he can not get positions in labor as well as those whose positions are purely honorary.

Q. (By Mr. PHILLIPS.) How are they regulated; are they not regulated by a few men?—A. No, they are not. They can sell out and get out.

Q. So can a laboring man; he can resign his position.—A. I will open the basket; I will throw up; I will submit.

OBJECTS OF THE AMERICAN SUGAR REFINING COMPANY.

Q. (By Senator MALLORY.) Did I understand you to say—perhaps I may have misunderstood you a while ago—that it was your policy to make as much profit out of the consumer as you possibly could?—A. Consistent with business methods.

Q. Consistent with business principles. In other words, your idea is that your organization, the American Sugar Refining Company, will, if it can, get the maximum profit out of its business from the consumer. Now, I also understood you to imply at least that it is the policy of the American Sugar Refining Company to crush out all competition, if possible.—A. But that is not so; there is no such testimony. I understand it has been put in that form by one of the gentlemen here, but it is not the fact. What I said was that it was the policy of the American Company to maintain and protect its trade, and if it resulted in crushing a competitor it is no concern of the American Company; if he gets in the press, that is his affair not ours.

Q. And if any one interferes with the business, profits, or competition of the American Sugar Refining Company it is its policy to prevent it if possible?—A. By lowering profits to defy it.

Q. And if it results in crushing him out—A. (Interrupting.) That is his affair.

Q. Not the affair of the American Sugar Refining Company?—A. No.

Q. Now, suppose in the natural course of events the American Sugar Refining Company should suppress—we will not use the word crush out—all competition, all opposition. I understand from your theory—business principles—that you would then seek to get out of the public and consumer the largest amount of profit consistent with your idea of business principles?—A. Precisely.

Q. Then, if you had the power to charge or impose prices on the public, what would be your idea of the limit that the public could possibly stand?—A. I think it would stand a quarter of a cent to-day. I think we could do it for 20 cents a hundred. I think the country is really damaged by having a number of people in the business.

Q. That is not an answer to my question. My question is the limit? What restraint would you put upon yourselves? What would be your restraint?—A. I call that restraint business considerations.

Q. Would it not be the utmost limit that the consumer would bear?—A. Until we had competition we should be in that position, but whether or not we would exercise it is quite another matter.

WHERE THE PRICE WOULD NATURALLY BE FIXED.

Q. In other words, if you had all opposition suppressed the prices would be as high as the public would bear without provoking additional competition?—A. Precisely. That is, in the absence of any tariff bill. If it was not for the tariff bill we would probably be doing as others are doing under it. Harrison had it very much higher; we can not, they can not.

Q. If you had, however, the same protection that others have in other lines of industry you would raise it higher than it is now?—A. We did have at one time considerable protection; but we did not take advantage of it, for the reason I have named, that we did not think it business policy to raise the price considering the large industry we had to control, and to expose it to outside opposition; but I maintain that we ought not to have had the opportunity under the tariff bill to have done it. I do not think the consumer should be placed in such a relation.

Q. On a philanthropic ground?—A. No, no; but it is to protect the consumer from being mulcted in an inordinate degree under the tariff bill.

Q. (By Representative BELL.) As I understand the witness he contends, and also establishes in a measure, that the entire procedure is a business proposition, and that he has in view all the time the permanency of his business?—A. Precisely.

Q. And in consequence of that you try to hold your prices at a figure that will be profitable to you by reason of your economical methods of concentration, and at the same time at a figure that would not be very profitable to others who are not so concentrated?—A. Precisely, considering the extent and the vastness of the business.

Q. And therefore that it redounds to the benefit of the consumer generally?—A. Yes.

Q. And to your stockholders by reason of their great economical benefit. That is my understanding of your general principles of business?—A. Precisely.

THE BUSINESS PRINCIPLES OF OTHER COMBINATIONS.

Q. But I want to ask you if all corporations or the trusts generally follow that principle in the early formation period of the organization?—A. I do not think any of them do, except the trusts that are not dependent upon a tariff bill; I wish that distinctly understood.

Q. Now, for instance, the copper trust. The cost of their product has about doubled in the last few years; it is something like 18 or 19 cents now where a few years ago it was 9 to 12. You take the iron and steel business. In that prices have gone up greatly. Farm implements, nails, wire, and everything made of iron and steel in the last few months have gone up enormously. Now, is it your judgment that in those industries the combinations are following the same lines that your company follows in holding prices down?—A. I should not like to criticize anybody else. It is very easy to determine what the price of copper was, what protection there is under the tariff bill, and what the price is now. Copper is produced in other parts of the world.

Q. Do you not think there can be a trust without the tariff bill?—A. Yes.

THE SMELTERS' TRUST.

Q. For instance, recently we have had the smelters syndicated; they have all gone into a trust. There is no tariff upon smelting; there is no tariff on their product. Now papers from my State, Colorado, where we have more smelters than any other State in the Union, that reached here this morning say that the smelter men have had a meeting and have agreed that if the men do not work after to-morrow by the hour (to-morrow being the day that the 8-hour law takes effect in the State of Colorado affecting the mines and smelters)—that if they do not yield to-morrow the employers will draw the fires from every smelter in the State?—A. That is a terrible thing; I would not want to face that. I think I would go out of business if I ever was confronted with any such condition of things as that.

Q. That is the report of the meeting of the smelter trust. Now, do you think that that is an advantageous organization where that kind of power exists?—A. How are you going to prevent it?

THE ELEVATOR TRUST.

Q. You have suggested the fact that the lowering of the tariff would destroy it. Now I am trying to point out a case where the tariff will not touch it, and we must have some other remedy. Recently, before the Interstate Commerce Commission, one of the managers of one of the large Western roads stated that they do not take freight from the individual farmer; that they can not, and that they never will deal with the individual farmer, or wheat raiser, or corn grower of the West while they can make a contract with a combination of elevators. He further says that they charge the elevators much less than they do the individual farmers and that they can afford to charge them much less. Now there is a combination entirely different from yours. There is one that takes a drawback. I appreciate the position you are in; you say you refuse to take a drawback because of the adverse comment and the conflict against good business policy. I realize the benefit and advantages, for I can see some of the reasons why your company has great prestige following such well-established business principles. But does the ordinary corporation or trust in its formative period do that?—A. Well, there is a very strict law, and of course if it is not enforced it is pretty serious on the fellow that is not in with the rebate.

Q. What would you suggest in the way of limiting these trusts that are not affected by the tariff; like, for instance, the elevator trust of Minnesota, or the smelters' trust?—A. They will not take commodities from the farmers, you say?

Q. That is, not at the same figure. They are bound to take freight; they are bound to ship a man's grain.—A. I should take it from the farmer in preference to anybody else. As business, I get down to the producer.

Q. But the railroads say that they will haul twice the distance for the elevator company that they do for the farmer for the same price.—A. That is against the law, is it not? Can you not get the law on those fellows.

Q. I think it is against the law. Yet they had them before the Interstate Commerce Commission, and when you prove that it is against the law they simply get around it in a different way. You do not believe combinations like that are beneficial to the public, do you?—A. That is so at variance with what my ideas of business principles are that I will have to admit that it is not.

REMEDIES NOT TO BE SOUGHT IN LEGISLATION.

Q. (By Mr. PHILLIPS.) Do you, then, believe that such trusts as the smelter and elevator trusts are beneficial?—A. Well, I own some stock in the smelter trust, and I am not going to commit myself on that; but I may talk more freely on the elevator trust, as I do not own any interest in that. But I say this: Hands off. The conditions that have arisen here between the miners and smelters will have to be settled among themselves. One of these days, when the laborers get well organized, they will make it all up. These things are fights between capital and organizations of labor; they will settle among themselves. You can not do it by legislation, gentlemen.

Q. (By Representative BELL.) The ordinary laborer or farmer can not wait; it means destruction to himself and his family. Your company can wait and some large wealthy company can wait; these weak individuals can not; and that is why people raise such a clamor against these great organizations; it is because they crowd out and cry down the individual citizen. Now, what we want is to find some remedies to prevent these evils for all parties.—A. Why not get the farmers together and form a trust of their own? (Laughter.) I mean it; I mean it, gentlemen. I would sell the grain to one party and establish some fellow to sell it to those elevators and let them share pro rata according to what they contribute. There is a way out of it. I never knew a corporation yet to have anybody under their thumbs very long.

Q. The economists and great thinkers and writers have always held that the farmers were so numerous and so scattered that it was impossible to hold them together, and that all their efforts would mean failures?—A. Yes; his conditions are so different; his necessities are so different and varied.

Q. (Interrupting.) It has been impossible to hold them together. Now, in speaking of the smelters, I get it from the newspapers again that the smelters at Durango have just shut down, while the smelters at Pueblo are just about to shut down, and the newspapers say that the owners of the smelters in making their argument to the men say: "It makes no difference to us; we had just as soon draw the fires as not, because we make the same profit." If the smelter at Durango shuts down, the ore will be smelted in Pueblo or at Denver; and they hold the same club over the labor at Pueblo, where there are several thousand smelter men. The managers of the smelters say to the men: "If the owners shut down it does not hurt us; it hurts you." They get their part of the profits. Those are some of the things that affect the public and the individual and create this prejudice; and, if possible, it seems to me that the men in these combinations ought to help us to solve these problems so as to avoid these injuries; and I was in hopes you would have something to suggest on these questions.—A. I think the same thing occurred in the sugar business when the trust was formed. We had to consider whether we should furnish this sugar to the consumer at a cheap price and get out of it a suitable dividend for the stockholders, or maintain all the different organizations and keep all the men employed. We naturally closed many of the refineries, concentrated the meltings in a few, and achieved the results we sought. But there were a great many men undoubtedly that were left out of employment and had to seek other employment. It is pretty hard. I read in the paper not long ago that along the line of one of the railroads they had established an industry, but found it unprofitable to work it, and after they had been there 10 or 15 years and the men had bought their homes, built houses, schools, and churches, the railroad, apparently in cold blood, shifted the industry somewhere else and left the men there. It looks like cold blood, but when you come to analyze it it is one of those conditions of trade that there is no human way to prevent.

TRUSTS SHOULD NOT BE REGULATED IN ANY WAY, SHAPE, OR FORM.

Q. (By Mr. PHILLIPS.) You have spoken in regard to the benefit of trusts, both in your paper and in your testimony, and you say they should not be regulated by law. As I understand, you would take the same position in regard to a combination of railroads. If railroads can in any sense be governed by law or taxed, has not the Government the same right to tax the great trusts or combinations in industry extending over the whole country and regulate them?—A. I doubt if they have the constitutional power.

Q. The States have the power, each individual State?—A. I doubt if a State has any power over the sugar company in the regulation of its prices; I do not think so.

Q. Do you believe that these trusts should be put more specifically under governmental control than they are, that they should have examination or inspection

similar to the national banks?—A. Not at all. I think the Government should have nothing to do with them in any way, shape, or manner.

Q. You think, then, that when a corporation is chartered by the State, offers stock to the public, and is one in which the public is interested, that the public has no right to know what its earning power is or to subject them to any inspection whatever, that the people may not buy this stock blindly?—A. Yes; that is my theory. Let the buyer beware; that covers the whole business. You can not wet nurse people from the time they are born until the time they die. They have got to wade in and get stuck, and that is the way men are educated and cultivated.

Q. Then, you think that they have a right to charter corporations and allow them to offer stock to the people—to the whole community—and that the community then has no right to a knowledge of what the earning power of that stock is?—A. Precisely. Take the other side. A lot of men get together in New York City and organize a company, and a capital of \$10,000,000 is to be put up. I go into New York City and say, "Gentlemen, put your money up whether you want to or not." They do not do it. They are not compelled to buy the stock. The State does protect these people as against any false statements, as against any fraud; but where a man goes into the stock exchange to-day and buys a hundred shares of sugar and pays 160 and it is 110 to-morrow, and he goes to the State and gets down on his knees: "Mother, dear, pay me the difference, and let us put the sugar trust out of existence." I say, hands off; there is nothing in it; hands off; let them settle it among themselves.

HISTORY OF THE ORGANIZATION OF THE SUGAR TRUST RESUMED.

Q. (By Mr. A. L. HARRIS.) I understood you to say that when the original American Refiners' Trust was organized in 1887 the refinery property of all the companies in business was not very valuable, that the business was being run at a loss, and that it was taken for the purpose of saving their property. Those are not the exact words, but it was taken to save the money invested?—A. Yes; a great many sold out for that reason.

Q. And a number of them quit running and were idle at the time—18, I think you said?—A. No; I said 18 went into the trust. I do not know how many were idle, but a number were.

Q. I understood you to say they were idle. What was the capitalization of the 16 or 18 companies that went into the trust before they entered it?—A. I do not know; but that had no relation whatever to the real worth. You know a company might have \$10,000,000 of assets and be capitalized for \$800,000. The capital has very little relation to the value.

Q. What I want to know is, if on the original capitalization it would show a profit. You say you do not know?—A. Yes.

Q. Do you know Mr. John E. Searles?—A. Yes.

Q. What position does he occupy in your company?—A. He used to be the secretary and treasurer. He has no position now.

Q. What position did he occupy in 1897?—A. The same; he was the secretary and treasurer then.

Q. Would his sworn statement be true in regard to the capitalization of the original corporation?—A. Oh, yes; he had the matter in hand; he knows all about it; I do not.

CAPITALIZATION AND VALUATION.

Q. Now, I see on page 384 of the New York investigation¹ that at the time the original Sugar Refining Company was organized in 1887 their capital stock was \$6,590,000.—A. Of all of them?

Q. Of all of them; that is, of the 15 or 16. He gives: The Havemeyer & Elder Sugar Refining Company, \$500,000; the Dick & Meyer Company, \$200,000; the De Castro & Donner Sugar Refining Company, \$350,000; the Moller & Sierck Company, \$210,000; the Oxnard Brothers Company, \$100,000; the F. O. Matthiesen & Wiechers Sugar Refining Company, \$400,000; the Brooklyn Sugar Refining Company, \$300,000; the Havemeyer Sugar Refining Company, \$1,000,000; the Forest City Sugar Refining Company, \$800,000; the Boston Sugar Refining Company, \$650,000; the Standard Sugar Refining Company, \$1,000,000; the Bay State Sugar Refining Company, \$225,000; the St. Louis Sugar Refining Company, \$755,000; the Louisiana Sugar Refining Company, \$450,000; the Planters' Sugar Refining Company, \$250,000; total, \$6,690,000. He gives that at \$6,690,000.

¹ New York senate investigation, 1897.

Now, if it be true that it was unprofitable to run those companies and so many of them had to get out, some of them had to go out of existence, how does it happen that this trust was organized at the time at \$50,000,000? In other words, how did you reach the capitalization of the trust certificates of \$50,000,000 in the original trust?—A. I said that the expressed capital in figures there of these companies has nothing to do with their real value.

Q. I understand that you put in more money; that these different companies had more money than is represented by the stock capitalization?—A. More money in stock, plant, and assets. Some of them had fifteen or twenty millions and they were capitalized at \$300,000.

Q. I am not able to understand that.—A. Take the capital, for instance, of the Chemical Bank. It has a capital of \$150,000, and its capital stock is worth \$3,500 a share.

Q. I am not able to see how a business that was not profitable can increase in such a rapid way.—A. I think I can illustrate it so that you will understand. You and I are in business and we run our business to suit ourselves. I say let us form a trust; you say no, and you do not care to go in. I go alone and I put up the price a quarter of a cent, and that enables you to make a fair profit. Now, I say to you, what do you want for your plant? You say this plant is worth a million dollars to me, but you will offer it to me for two, and I take it. I can make more money by buying that plant for \$2,000,000 with the advance in price than I can by leaving you out, and I give you the entire advantage of your work on that plant.

Q. But at the time this trust was organized you did not buy the plants?—A. Yes, we did buy them—bought the whole business; there was not a share of stock in any shape or manner but what went into the trust.

Q. In the original trust you issued stock certificates?—A. Yes.

Q. How did you reach that valuation by which you could distribute that \$50,000,000 among the 16 or 18 companies that were taken into the original trust?—A. My faint recollection of the matter is that they had a committee of appraisement to appraise the values, taking plant, location, trade-marks, status of business, and all considerations, and that they agreed upon an amount for which they would transfer their property in consideration for so many certificates on an aggregate capital of so many dollars.

Q. How many of these original companies were dismantled?—A. Oh, I do not know. You are talking about things that occurred 12 years ago.

Q. Of course it is plain to you, but it is not to me.—A. I have made the general statement that while 18 corporations went into the affair the whole melting capacity is now being concentrated into 6 or 7. That answers your question.

Q. I do not care about your specifying the exact number.—A. I could not do it.

Q. All I want to get at is how you put in and issued stock certificates for plants that were considered worthless?—A. They were worthless under those conditions, but they were not worthless under the conditions that were about to prevail.

Q. You went on with this original trust until 1891?—A. Yes.

Q. When the North River suit went against you?—A. Yes.

Q. Then you organized in New Jersey?—A. Yes.

Q. Then you bought all these concerns and issued stock for them?—A. No; we bought and paid stock and cash.

Q. You paid stock and cash?—A. Yes.

Q. It was not all stock?—A. We bought the property.

Q. Now at that time, as I understand, you were making 90 per cent of the product of this country?—A. No; 67 I think the figures show.

Q. Well it was 67 in 1898?—A. It was 65.

Q. You had the capacity, I think, of making 90 per cent?—A. We had competitors.

Q. You had that capacity then?—A. But we could not run it, because we had outside competitors.

TESTIMONY BEFORE THE LEXOW COMMITTEE.

Q. Shall I read to you your testimony before the Lexow committee?—A. You are confounding capacity with output. You see, we may have the capacity for turning out the sugar and not have an output for it.

Q. I will change the question. What is your output?—A. Well, the output may be equal to the capacity. I do not know what this testimony was.

Q. But what per cent?—A. I do not know.

Q. You have some rather valuable testimony here. I do not know but what there is a page or two that might be read; and of course, if you care to correct it, it should be read and you should be asked to explain it. You should have that

opportunity, and let it go into the testimony and be explained. It is only 2 years ago, and you were asked in that commission, by Mr. Lexow, concerning testimony before the Senate bribery committee as to certain facts, this question (reading):¹

"I call your attention to the testimony that you gave before the United States Senate committee in answer to Senator Allen:

"Q. When you sell in this country you control the price?—A. Yes, sir.

"Q. And it was organized, as I understand it, with a view of controlling the price and output to the people of this country?—A. That was one of the objects of consolidation.

"Q. And you have succeeded in doing it?—A. Yes, sir.

"Q. That was the principal object in organizing the American Sugar Refining Company?—A. It may be said that that was the principal object."

"Q. Mr. HAVEMEYER. To control the price?—A. Mr. LEXOW. Yes, sir,

"Q. And making money incident to that control?"

"Mr. HAVEMEYER. Did I say "control of price" or "control of output?"

"Mr. LEXOW. Control of the price and the output.

"Mr. HAVEMEYER. I don't think that is right.

"Q. Do you wish to change the testimony that you gave before the Senate investigating committee?—A. I should have read it myself. [Witness reads testimony given before Senate committee.] It certainly does appear that at that time that was my understanding of one of the objects of the formation of the American Sugar Refining Company.

"Q. You say there that it was the principal object; do you mean to say now that your recollection of the object of the organization of the American Sugar Refining Company in 1891—do you mean to say now that your recollection is better as to the main and principal object of that organization than it was in 1894, when you gave this testimony?—A. I would answer by saying that when I gave that testimony that was in my mind, and I answer now what is in my mind; that is not in my mind now.

"Q. Then this testimony was true that you gave before that committee?—A. That is the way that I felt at that time, undoubtedly.

"Q. Therefore we start out with the proposition that the main object of the organization of the company was to control the product and to control the price of refined sugar in the United States?—A. No, sir; I think that is too broad; the intention was to control the output of their product and the price of their product.

"Q. That would control, under the circumstances, as you control the company?—A. Undoubtedly.

"Q. Therefore the organization of a combination of interests, all of which you controlled at the time of the organization, could not have been for the purpose of controlling their output or their price?—A. How could I control the output or the price of any other refinery? It goes without saying that a man who produces 80 per cent of an article can control the price by not producing; the price must advance if he does not produce; and it must decline if he does produce, if he produces more than the market will take; I do not see any significance in contrasting the evidence."

(By the WITNESS.) Now that is the gist of the whole matter.

Q. Let me go a little further (reading). "Q. You were asked by me as to whether or not one of the objects of the organization of the New Jersey Company was to control the price and the product. You said, in answer to my question, that it was neither; that you had no intention of controlling the price or the product. In the United States testimony you state that that was the main object of consolidation; that is to say, to control the price and the product and the refined sugar of the United States?—A. I am willing to admit either phase; as far as the object is concerned it goes without saying that a corporation that controls 80 per cent of the product does control the market price up to the importing point if it chooses to exercise that power, for it goes without saying that that same power can be exercised to diminish the price; when you ask whether it was the idea in mind on the formation of the company, I would say that I do not think it was; that testimony wants to be read in connection with what went before it and with the objects of that investigation.

"Q. Then, according to your present version of it, in any event, whether it was your object or not, that object was reached by reason of your controlling 80 per cent of the product; you do in fact control the product and price in the United States?—A. We undoubtedly do.

"Q. You do it by reason of the consolidation of the interests which can pro-

¹ Report and Proceedings of the Joint Committee of the Senate and Assembly Appointed to Investigate Trusts. (Lexow Report) Albany, 1897, pp. 109-112.

duce 80 per cent of the refined sugar of the United States?—A. I do not know what the consolidation of interests has done; we do through the fact that we refine so much sugar.

“Q. You have brought under one head and under one direction, through your company, the agencies that produce 80 per cent of the refined sugar?—A. We might do as we did at one time, control 95 per cent of the sugar; and the Supreme Court has decided that it is perfectly legal to do it.

“Q. I understand you to say that you produce 80 per cent of the refined sugar?—A. From 75 to 80 per cent.

“Q. When you entered upon the sugar-trust arrangement in 1887 you had numerous competitors in the market, did you not?—A. In amount greater, so far as output, than to-day; in numbers, fewer.

“Q. That is to say, that each of those 15 companies was undeniably competing in the market for the sugar trade?—A. Do you mean when we formed the trust?

“Q. Before.—A. Yes, sir.

“Q. And the formation of that trust removed that competition?—A. To a very great extent.

“Q. To the extent of those 15 companies?—A. Not absolutely; the companies were all controlled by separate members, and they had their own views of matters, but practically, yes.

“Q. Didn't the price of sugar decline materially prior to 1887—prior to the time of the formation of this so-called trust?—A. A year or two previous it was slightly lower; for a period of 10 years it was slightly higher.

“Q. After formation of the sugar trust the price of refined sugar was increased?—A. Slightly advanced.”

This testimony which I have just read begins on page 109 and ends on page 112. I ask you if you have any explanation to make of that?—A. No; that is perfectly clear; I do not see that that needs any explanation. I stand by that, every word of it.

RELATION OF SUGAR TRUST TO OTHER COMPANIES.

Q. I have a question or two that I would like to ask the witness. One of them is whether or not the American Sugar Refining Company has any interest in the Mollenhauer concern?—A. I prefer not to state about that. That is a little bit too private.

Q. Or in the Nash Company at Boston?—A. Well, the same answer.

Q. Or in any of the other refining companies that are now refining sugar?—A. I have stated that they have an interest in the Western Sugar Refining Company with Mr. Spreckels.

Q. Now, you have stated that you have cut down the price of coffee by competition with the Arbuckles?—A. No; I said there had been a drop incident to the large production.

Q. If you had not gone into the roasting of coffee, or into the coffee trade, the probabilities are that it would have remained still 5 cents profit instead of 2½?—A. Five cents profit; yes.

Q. Five cents profit instead of 2½. That has been brought about by the competition—that reduction?—A. Yes.

Q. (By Mr. KENNEDY.) Can you state whether your recent dividends have been paid from profits or from the surplus that has been piled up?—A. I am unable to answer that.

Q. You do not know?—A. I can not answer any more definitely.

Q. It is true that the wholesale grocers make little or no profit out of the sugar they buy from your company and sell to the retailers?—A. I think they make very little or none now.

Q. Very little?—A. They did make a little before September, 1898, but since then—since the competition of the outside refineries—they have been unable to make any profit of any account out of refined sugar.

THE FACTOR SYSTEM EXPLAINED.

Q. (By Mr. JENKS.) Will you explain to us in brief what your factor system is and how it works at the present time? That will perhaps bring that out a little more clearly.—A. On October 10, 1895, the American company established what is known as the equality plan. It continued in force until about March, 1897. The affidavits under that plan were discontinued in the State of Ohio for some time previous to March, 1897. The plan as embodied in the papers herewith included a rebate to the grocer of three-sixteenths of a cent a pound, providing he maintained the price fixed by the American Sugar Refining Company. The competi-

tion resulting from the operations of the outside refineries after September, 1898, rendered this plan inoperative. Although the form of selling sugar continues, the price has been disregarded, so that there is no profit whatever under the plan.

THE AMERICAN SUGAR REFINING COMPANY,
P. O. Box No. 2036, New York City.

—, 189 .

GENTLEMEN: We are in receipt of yours covering invoice for sugar. We desire to be enrolled as your agents and to receive sugar on consignment, in accordance with the terms of your letter, and we hereby agree to faithfully maintain the terms and conditions therein provided on all sugar received by us.

Yours, truly,

[The American Sugar Refining Company.]

NEW YORK, —, 189 .

DEAR SIR: We inclose herewith invoice of even date, from which you are entitled to our usual deductions of 1 per cent trade discount on 100-barrel lots and 1 per cent for cash if paid within 7 days.

Should you so desire, we shall be pleased, upon receipt of within written request, to constitute you one of our agents, in which case sugar will be consigned to you for sale as our factor, upon the following terms, the title to remain in us subject to your advances and return to you of your necessary outlay.

1. You are to advance to us within 30 days the amount of the invoice, which will be made up at our daily quotations, less 1 per cent trade discount on 100-barrel lots, with the right to deduct 1 per cent additional if invoice is made cash in 7 days; the advance to be without recourse to, or reclamation upon us, and to be due in any event.

2. The sugar when sold is to be billed in your name, although in fact as factor for us, and you shall without reclamation upon us, at your own cost, pay all expenses, and assume all risks of the property, and of payment of collection. You are not to incur any expense on our account.

3. None of the sugar shall be sold or disposed of by you, either directly or indirectly, for less than our daily quotations with freight added from refining point to point of sale (as per equality rate book), nor on more liberal terms as to credit or cash discounts.

So long as the foregoing conditions are observed by you, we will, upon an affidavit to that effect, pay you a commission of three-sixteenths of a cent per pound, and in addition thereto you shall retain the profit, if any, over the advance made as above provided. In case of any failure to comply with either of the above conditions no commissions will be payable. Settlements will be made for each month's commissions at the expiration of 3 months thereafter. All commissions payable for the period preceding the 3 months will then become due. Payments will only be made as above.

This agency is terminable at the pleasure of either party on written notice.

Yours, respectfully,

THE AMERICAN SUGAR REFINING COMPANY.

Bought by a corporation.

STATE OF —, County of —

—, being duly sworn, says: I am the — of the — Company. That company, as factor of the American Sugar Refining Company, claims from the Sugar Company a commission of three-sixteenths of a cent per pound (less 1 per cent where trade discount has been allowed), upon — pounds of sugar consigned by the Sugar Company to it by invoices, the dates of which cover the period from — to —, inclusive. In compliance with the conditions upon which the sugar was consigned to the company, and to entitle it to the commission I do hereby make affidavit that none of the sugar mentioned in the said invoices has been or will be sold or disposed of by the company, either directly or indirectly for less than the daily quotations of the American Sugar Refining Company, with freight added from refining point to point of sale, as per their equality rate book, nor on more liberal terms as to credit or cash discounts.

Sworn to before me this — day of —, in the year 189 .

Bought by a firm.

STATE OF ———, County of —

—, being duly sworn, says: I am a member of the firm of — That firm, as factor of the American Sugar Refining Company, claims from the company a commission of three-sixteenths of a cent per pound (less 1 per cent where trade discount has been allowed), upon — pounds of sugar consigned by the company to the firm by invoices, the dates of which cover the period from — to —, inclusive. In compliance with the conditions upon which the sugar was consigned to the firm, and to entitle it to the commission, I do hereby make affidavit that none of the sugar mentioned in the said invoices has been or will be sold or disposed of by the firm, either directly or indirectly, for less than the daily quotations of the company, with freight added from refining point to point of sale, as per their equality rate book, nor on more liberal terms as to credit or cash discounts.

Sworn to before me this — day of —, in the year 189 .

Q. Why did you stop asking for an affidavit?—A. Well, some of the States passed laws that counsel held it was in contravention of and we did not further request it. And then again the plan never was very successful; there were so many infractions of it that it was really of no practical effect.

Q. (By Mr. KENNEDY.) Are you interested in the beet-sugar industry of the country?—A. Somewhat on the Pacific slope; none east of the Rocky Mountains.

Q. Do you believe the time will come when the beet-sugar industry will furnish this country all the sugar it will consume?—A. If the people of the United States consent to a burden of \$40 a ton on imported sugar, I suppose one of these days the beet-sugar industry will furnish the United States, providing Cuba, Porto Rico, and the Philippines are not annexed, or their products imported free. Those countries could easily within the next 3 years supply the United States with all the sugar they require irrespective of the supply from the Hawaiian Islands or Louisiana.

Q. (By Mr. PHILLIPS.) That is, cane sugar?—A. Cane sugar.

Q. (By Mr. KENNEDY.) If that is done, then the beet-sugar industry will have to be suppressed, will it?—A. It will be relegated where it properly belongs, in competition with the cane. I suppose if they attempted to grow beet sugar in Alaska they would want \$250 a ton. I do not see why they should not get it the same as they do in Louisiana, where the natural condition of the cane is above the frost line.

Q. You stated this morning that you believed in the Federal Government and the State governments keeping their hands off with regard to these matters of trade. Do you believe in the Government keeping its hands off in regard to such matters as adulterated food?—A. I do not.

Q. You think that is a proper place for the Government to step in and put its hands on, do you?—A. I certainly do. There is no way that the consumer can be protected against adulterated food except by law; trade conditions do not control that.

Q. Did the American Sugar Refining Company, or representatives of it and of the independent companies, recently go into some sort of an organization on that line?—A. No; not at all.

Q. The report to that effect in the New York Sun was not true, then?—A. Not true in any paper; not true at all.

Q. Does not the American Sugar Refining Company furnish coöperage to the independent companies?—A. We furnished coöperage to Arbuckle, I believe, for 2 years, then an outside company underbid us, and they do the work now. The trust is suffering now. [Laughter.]

LABOR, WAGES, AND CONDITIONS UNDER WHICH LABORERS WORK.

Q. (By Mr. PHILLIPS.) Do you employ a large amount of labor in the sugar-refining industry, skilled or unskilled, or both?—A. Almost exclusively unskilled, the lowest kind of labor, getting from \$1.35 to \$1.50 a day—Poles, Bohemians—the lowest class of labor in the country.

Q. Well, are not the conditions under which the labor is performed very deleterious to health?—A. No; it is very beneficial.

Q. Do they not have to labor in intense heat?—A. They do, but they sweat out the beer they drink and it does them good. I guess the percentage of injury in the sugar refineries is less than in any other business. The vapors of sugar are beneficial to the lungs, and the heat keeps the pores open and sweats them out—keeps the heat out of the system. I am a physical illustration of the effects of the work, having worked in a sugar refinery myself for 5 years.

Q. Then you employ what you consider the lowest class of labor; and even when you are making very large sums of money, your wages are not high, are they, compared with others?—A. I will tell you what we do: We employ the labor as it presents itself to the bar, and when we find a man that is qualified physically to stand the heat and do the business we give him 10 per cent more than he can get anywhere else, and we keep him; and I do not think there is on record any strike whatever since the Sugar Trust has been in existence; and it is on account of the business principle again, that, having a good man and paying him more than he can get elsewhere, you can keep him. There is not a man in our department, in my opinion, that can go out of it and earn as much as he can in our refinery.

Q. How many laborers does the American Sugar Refining Company employ?—A. Oh, I have not figured that up, but I should say at least 10,000 right around New York, Boston, and Philadelphia.

Q. Do the laborers employed in the refineries, as a rule, belong to the unions?—A. Not the unskilled laborers. The skilled laborers do—the carpenters and mechanics; but the advantage to them in the sugar-refining company is that they have work the year around, and we can weed out the poor ones.

Q. Is there no way to ventilate the works so as to prevent the men working in such intense heat as they do?—A. That is very much exaggerated. The normal heat of a refinery is 90°; there are places where the sugar is dried where it runs up to 110°. They rather like that heat; they perspire freely and do not feel it. They drink a great deal of beer, and that tends to promote perspiration.

Q. Is it essential that they work in such heat?—A. Yes; that is part of the process.

Q. You can not cool the atmosphere by any artificial means and get the results you do?—A. No; you can not conduct the business under 90° in some departments.

Q. I would say this, that it has been stated that the sugar-refining industry pays quite small wages, and they work in the heat, which is unhealthy, and these conditions—A. Oh, that is all false; that is all false.

Q. (By Mr. JENKS.) How many hours a day do your employees work regularly?—A. In summer they work in shifts of 8 hours and in winter they work in shifts of 12 hours, with 2 hours for their meals; in other words, in summer they work 8 hours a day and in winter they work 10.

Q. They run day and night?—A. They run day and night constantly, and there is always a great clamoring for overtime.

Q. You say they work 8-hour shifts in summer and 12 hours in winter. What difference do you make in their wages for the 8 hours in distinction from the 12-hour shifts?—A. I believe they get the same wages; it is hotter.

Q. (By Mr. RATCHFORD.) Do you find that class of men you name, Poles and Bohemians, better adapted to your work than other classes of labor?—A. No; they are willing to work for less. You can not get an Irishman now. They can generally get more money; they do not apply any more.

Q. They are willing to work for less, you say?—A. Yes. The Irishman gets more; all other classes get more.

Q. For common labor?—A. Yes.

Q. Will facts bear that statement out, you think?—A. Oh, I do not think you can get a laborer for \$1.50 a day in New York, 24 days in a month—that is, \$36 a month; I do not know of that. You have to pay grooms in the stable \$50.

Q. Then, it is not because they are better adapted for the refining of sugar that you employ them; you employ them because they are the cheapest?—A. Yes; because they are the cheapest.

Q. And with the wages you pay them they drink a great deal of beer?—A. Yes. We furnish them beer at cost, and they drink a great deal of it, or so much a day.

Q. How much a day?—A. Well, a pretty good deal, some of them; I would not want to say the exact figures.

Q. (By Mr. PHILLIPS.) How much does it cost each one a day for the beer he drinks at cost—the cost on the average?—A. Oh, I would be jumping at that; I should think 15 cents.

Q. (By Mr. KENNEDY.) You own your own brewery?—A. No. We buy beer of a certain standard, sell it by weight, and give it to the men at cost. Otherwise they would be running out to saloons and getting drunk, and be away from their work, and gambling their money away. We do it as a business proposition again.

Q. You have been very frank in some of your statements, and I notice that in a previous investigation you very frankly said that you made contributions to campaign funds on both sides. I would like to ask you whether or not it is true that the American Sugar Refining Company made large contributions to the

Cuban cause previous to the Spanish-American war?—A. I do not recollect that they contributed a cent. I am quite sure we did not; if we did, it was some insignificant sum.

THE TARIFF AND FOREIGN COMPETITION.

Q. (By Mr. NORTH.) I would like to ask the witness if he has made any statement to the commission as to the imports of refined sugar into this country?—A. I have not.

Q. Will you state what the imports of refined sugar are at the present time?—A. I do not know. They are a matter of record. I should not think they were anything.

Q. You should think they were nothing?—A. Yes.

Q. In other words, the American Sugar Refining Company does not suffer from the competition of imported sugar?—A. Not at this immediate time.

Q. Why, then, do you state in the paper which you read before the commission this morning that the least protection refined sugar should have is double what it gets under the existing tariff?—A. We get under the tariff one-eighth. Suppose we are losing one-fourth in our business, we would still want one-eighth to make it good, would we not?

Q. Are you losing one-fourth?—A. I will not say that.

Q. If there are no imports of refined sugar and consequently no competition from foreign refiners, is that not sufficient evidence that the present tariff is high enough to protect the American sugar-refining interest?—A. It is no evidence whatever, because competition with the American goods opens up outside refineries; local men, not foreigners.

Q. I do not understand that answer. My question is, if the American Sugar Refining Company has no competition from foreign refiners, is not that fact sufficient evidence that the tariff is adequate?—A. It is no evidence whatever.

Q. Now, will you tell the commission why?—A. Because the competition itself is local. If the Government should give us one-fourth cent a pound and give our competitors nothing, then we would be able to live. If they give Louisiana \$40 a ton, why do they not give it to us?

THE TARIFF AND LOCAL COMPETITION.

Q. The local competition has nothing to do with the tariff?—A. The local competition has a great deal to do with the condition of the sugar-refining industry, and that is why we do not make any money.

Q. The tariff has nothing to do with the local competition?—A. I did not say it had.

Q. Well, but your answer implied that it did.—A. I do not think it implied anything of the kind.

Q. (By Mr. FARQUHAR.) What proportion does the production of Louisiana cane sugar figure in the whole production of the United States?—A. I believe it is about 10 per cent.

Q. That seems to be the only feature you have criticised?—A. The Hawaiian Islands another 10 per cent, and then these other beet sugars 5 per cent.

Q. However, all of these figure up how much per cent?—A. Twenty-five.

Q. Say 20 per cent?—A. Twenty-five.

Q. So you have a field for 80 per cent yourself?—A. The sugar-refining industry has; yes.

Q. I do not mean that; I mean your own business. I am not talking about any outside refineries; I am talking of what you have said this morning before us. Do you base all you have said about these matters and everything else on this question of 20 per cent? Do you want all this 20 per cent abolished and placed under the same tariff conditions that control the 80 per cent?—A. I have not mentioned that.

Q. I ask the question as a matter of business, would you?—A. I would not give them anything.

RAW SUGAR PRODUCERS SHOULD HAVE NO PROTECTION AT ALL.

Q. You would not give them anything at all?—A. No, they are an agricultural product, and if they can not produce under natural conditions, I would not give them anything at all. If you follow it to its logical extent and give Louisiana 40 per cent because they claim it, why do you not give Alaska \$500 a ton because they claim it?

Q. Well, that is highly hypothetical.—A. Then I refuse to answer that question.

Q. (By Mr. CONGER.) Let us follow your statements to their logical conclusion, and then reverse them. If you would not give Alaska \$250, nor Louisiana \$40, why should the American refining industry have any, and why should not the refining be done on the other side of the water?—A. There is no reason except the true one, and that is just what has been before the American people, and they voted on it twice. They voted Harrison in in the one case, and McKinley in in another; on a straight free-trade issue, or protection, the American people have declared for protection. It promotes civilization in America; it takes the poor man, gives him good food, schools his children, clothes them, feeds them better, and pays better wages. That is the whole and the entire point in which the nation is placed, so far as that is concerned. If you can not take sugar out of the soil of America, there is no reason in the world why you should provide any tariff or compensation which nature has not provided for, and which it has provided against.

Q. So far as this protection is concerned that you have, you want it on your industry. You have given us a very nice argument for protection. It seems to me that the logical conclusion from your argument is that there should be no protection at all upon the refining of sugar, which would remove the base of operation for refining to Europe.—A. My argument is, and has been, that if the American public is going to vote for protection on industry, they should limit it to 10 per cent. That is my argument.

Q. A moment ago you said they had limited it, that the American people, I think, voted in favor of this?—A. Yes, to manufacturers. I do not object to the local men getting a moderate protection. You asked me what the American people did, and that is what they did; the American people believe that a manufacturer should have protection. Now, those who are skilled in determining what protection these people should have, in my opinion, have given them inordinate rates. I stand for protection; I favor it; I have never said anything against it; I am in favor of it.

Q. (By Mr. FARQUHAR.) You say manufacturers. Of course in that you mean the workman and the middleman and all interested in American industries?—A. I think that the proper protection for all the people should be 10 per cent.

Q. (By Mr. NORTH.) Are you manufacturing and selling sugar at a loss to-day?—A. I decline to answer that. That is simply a matter of the American Sugar Refining Company.

Q. (By Representative LIVINGSTON.) You said that you were in favor of moderate protection on manufactures. Why not give a moderate protection to the producer of raw material that comes into competition with the foreign stuff?—A. I should be very happy to. I should think that would be the proper solution of it, but I should consider nature in the matter. If sugar can be produced in Louisiana for 2 cents a pound, I do not see why you should give them 2 cents a pound bounty. I should think that reasonable protection to all industries is the proper one. I think that is what the American voters have twice decided; but those who have had it in their power, give an inordinate protection, and that is what I claim and still maintain is the cause of all this trust agitation and clamor against it; and the public are mulcted by it.

Q. (By Mr. FARQUHAR.) Has not the bounty in Louisiana been abolished?—A. The bounty is abolished, but they get it indirectly in the form of the tariff on sugar of \$40 a ton.

Q. (By Mr. NORTH.) You made this statement here this morning: "Here you have \$24,000,000 extracted from the people of the United States for the sake of getting a revenue which \$40 per ton on foreign sugar provides. This is merely illustrative of the character of the tariff, every line of it, and its effect upon the people." Now, I would like to ask you if you are not aware that there are many articles sold in this country at prices considerably less than the duty on these same articles?—A. No; I do not know anything about it.

CONDITIONS IN THE PRINT-CLOTH INDUSTRY.

Q. Are you not aware that print cloths are now selling for less than the duty on print cloths; that the domestic price of the print cloths is less than the duty on print cloths?—A. No.

Q. Do you decline to answer the question?—A. No; I do not decline to answer it; give it to me again.

Q. I ask you if you are aware of the fact that print cloths are selling for a sum less than the duty?—A. No; I am not.

Q. Do you think, in view of the fact that you are ignorant of a point of that kind, that you ought to make a statement such as I have just read?—A. Yes.

Q. Although you are not aware of whether it is true or false?—A. What has that got to do with that principle that you have laid down? Where is the print-

cloth trust? What is the matter with them? Where are they that they do not come in out of the wet and get all of this advantage from the tariff? You are talking about a condition of things that allows them to get it and fleece the public to that extent.

Q. I am talking about the condition of things that exists in a great many staple industries of this country.—A. Well, they will soon get on to it; it is progressing fast.

Q. Do you not think, in view of the fact that you made this statement without knowledge and in ignorance of the fact, that it would be desirable for you to withdraw it?—A. No.

Q. I think that if the question and answer can go together I am perfectly satisfied to leave it where it is. (No audible response by the witness.)

AN INCREASE IN THE TARIFF WOULD NOT HELP THE SUGAR TRUST.

Q. (By Senator MALLORY.) I understand that, in your judgment, a tariff of one-eighth of a cent a pound on refined sugar is not sufficient.—A. That is my proposition.

Q. There is no money to be made in sugar refining at a tariff of one-eighth of a cent. I understand that one-fourth of a cent, in your judgment, would be better.—A. Yes.

Q. There is no foreign competition, as I understand, and the only competition you have is domestic.—A. That is, at the moment.

Q. At present. Now, what I would like to get at is how would an increase of the tariff from one-eighth to one-fourth of a cent enable you, under existing conditions, to improve your business?—A. It would not.

Q. What increase would?—A. None.

Q. No increase in the tariff at all?—A. Not under existing conditions.

Q. (By Mr. NORTH.) Why do you ask for it?—A. For contingencies. (Laughter.) I have nothing to conceal in the matter; why should I? Why should this business be carried on at a loss, when it can be carried on at a profit? We want to carry it on. We do not want to be inundated with foreign products.

DIVIDENDS AND LOSSES.

Q. (By Mr. NORTH.) Are you now carrying on business at a loss?—A. I have answered that before; I have no other answer to give to it.

Q. You refused to answer it before.—A. Well, I refuse to answer it now.

Q. How do you carry on business at a loss and still declare dividends?—A. You can carry on business at a loss and lose money, and you can meet and declare dividends. One is an executive act and the other is a business matter.

Q. (By Mr. PHILLIPS.) Where do you get the money, though?—A. We may borrow it; the sugar company has got pretty good credit.

Q. (By Mr. NORTH.) How many years can the American Sugar Company keep up that practice?—A. That is a problem to everyone. We would either buy or sell the stock if we knew that.

EFFECT OF THE REMOVAL OF THE TARIFF RESUMED.

Q. (By Representative LIVINGSTON.) I understand that you have practically no foreign competition now?—A. No.

Q. Now, I want to understand whether, if this one-eighth was taken off, it would be detrimental to the interests of this country? Have you taken that position?—A. I think it would, under existing conditions, which are ruinous in them-

Q. Now, I want to know definitely whether, if we should take off the tax, throw it overboard, make the importation of refined sugar free to the world, your idea is that this country would be the dumping ground of all the refineries of the world, and ruin your business and destroy the labor you have employed, and all that?—A. Precisely.

Q. Now, how can sugar be made in Germany from beets, or in the Philippines from cane, or in any other part of the world cheaper than you can make it here? Is that owing to the labor, or what is it?—A. Because, in the evolution of sugar refining, refined sugar can be made directly from the beet without the intermediation of the sugar refinery.

Q. Then it is not the cane sugar abroad that you fear coming in, but the beet?—A. Both.

Q. Both?—A. The cane now amounts to two-thirds of the total product.

COST OF REFINING LESS ABROAD.

Q. You do not mean that the cane sugar can be refined abroad and shipped in here?—A. Cheaper than it is made in Louisiana and refined in New York.

Q. Cheaper than you can refine it?—A. Yes.

Q. What is the cause of that?—A. Labor is cheaper in England.

Q. Well, there is the cost of transportation to pay?—A. That does not amount to anything.

Q. Insurance is heavy?—A. You must recollect that they take the product from abroad merely at a nominal rate here for nothing but ballast; they expect to get freight from this side. The great business in freight is the exportation of merchandise from this country. We are large exporters. The charge on freight to this country from either Antwerp, Hamburg, Bremen, London, or Greenock, is purely nominal. All freighters would like a cargo of sugar; that comes in bags that can be compactly and conveniently stowed.

Q. You mean the foreign sugar imported comes in bags? I thought it was put in barrels?—A. Yes, altogether in bags; it is generally only the American sugar that is put in barrels.

Q. Can you give us the rate from Hamburg?—A. Not to-day; I can not; I am not familiar with it. There has never been an opportunity afforded to the American Sugar Refining Company to demonstrate to a Committee of Ways and Means the disadvantages the industry is under as compared with foreigners, because there is constantly in their mind the public demand that something should be done to the Sugar Trust, no matter what injustice there is in it. You are not acquainted with it. That is the whole logic of the situation.

Q. If you were left perfectly free, would you be willing to face the situation if you were guaranteed that the duty would be taken off?—A. Why, we should be ruined.

Q. You would?—A. Absolutely. Why, England can produce it. England is one of the greatest and cheapest sugar-producing countries. They have free sugar and in 2 years they cut their refining industry from 2,000,000 tons down to 1,000,000; just divided it in two.

Q. What is the stock of a sugar company of England worth as compared with the American Sugar Refining Company?—A. It is not worth anything. I do not suppose you could sell a sugar refinery in England. There is one refinery in England that works a certain brand they have and pays a moderate profit, but the sugar-refining industry is gone, absolutely gone.

SUGAR INDUSTRY BUILT UP UNDER PROTECTION.

Q. Was the American sugar interest built up under a system of free trade or protection?—A. Protection. Why I can recollect when I went down to Washington as an individual, as one of the firm of Havemeyer & Elder—now I want you to bear that in mind—the invitation was: "Come in. What do you want, a cent a pound? You should have it. Of course we will give it to you. You deserve it." When I went down there as a representative of 5 times the capacity of Havemeyer & Elder, because I was in a corporation, the greeting was: "Get out of here. You can not get anything, no matter what it is, now." That is the way with every interest. That is a fact. They simply draw this distinction between what is done by the individual, or a firm, and a corporation. Individual business is everything, and a corporation has nothing to do with it.

Q. I did not mean to ask of your particular enterprise?—A. Oh, I thought you did.

Q. But I asked you this question: If the refining industry of this country was built up under protection or a free-trade system?—A. Protection, enormous protection. [Without the tariff I doubt if we should have dared to take the risk of forming the trust. It could have been done; but I certainly should not have risked all I had, which was then embarked in the sugar business, in a trust unless the business had been protected as it was by the tariff.]¹

Q. How about the English, was that under free trade?—A. They started before the beet culture became so large as it is. Beets have only been grown within 10 or 15 years. But since they started to cultivate beets so much in Germany, France, Austria, and Russia and extract the sugar from the beet itself the importation of beet sugar has ruined the industry in England. It is an illustration of what the American people should avoid. Never allow a foreign country, if it can possibly be avoided, to get its nose into this country and get into its productions.

Q. What do you say about the foreigners letting us get our noses into their country? Do you catch it both ways?—A. Well, I should have to think that out.

Q. That is a rule that works both ways.—A. Well, this question has been before

¹ Added later.

the American people twice and they have voted on the straight issue for protection. I do not say I am individually in favor of protection. As an abstract proposition I do not know but what free trade would have as strong an argument as the other.

TRUSTS AN ADVANTAGE WHEN NOT INORDINATELY PROTECTED.

Q. (By Mr. RATCHFORD.) Taking your testimony as a whole and analyzing it, it strikes me that the existence of these trusts, large moneyed corporations or combinations, is sought to be justified upon the ground that such trusts or moneyed combinations are an advantage to all the people. Is that correct?—A. When they are not inordinately protected under the tariff—I qualify it—so that in their operations they can not fleece the consumer.

Q. Very well. We will take for an illustration, then, the combination that you are representing. It is not inordinately protected under the tariff. In one of your statements you say that we have already too many men in business in this country. Coupling those things together—A. (Interrupting.) What did I say?

Q. That we had already too many men in business in this country.—A. You had better point that out if you are going to quote my testimony.

Q. I do not wish to misrepresent the witness at all. He now states that such a statement has not been made?—A. I do, emphatically.

TRUSTS IN EVERYTHING WOULD BE BENEFICIAL IF LIKE THE SUGAR TRUST.

Q. The point I wish to bring out is simply this, that if it be an advantage to the American consumer to buy his sugar from one trust, or combination, or company, would it not be an equal advantage to the American consumer to buy his flour, his coffee, his clothing, and all other articles of necessary use from one combination or company?—A. If they were conducted on the same business principles that the American company has been, I think it would be.

Q. Upon the same business principles. I want to ask the witness another question along this line. Have you in mind, taking into account your very large experience, any man, any company, any trust or corporation who sell their wares or goods in a noncompetitive market and who are not getting the highest possible price that the consumer can afford to pay for them?—A. Well, I do not know the gentleman's name, but the tariff on print cloths is an illustration of it. He said that his company was not getting the tariff on print cloths, and I have indicated to him that if he forms a trust that there is nothing in the tariff bill that will prevent him from getting that. So there is an instance of an industry getting less money than is possible.

Q. Have you any other instances?—A. The philanthropic work on the part of these corporations is very seldom, but I think you are perfectly right in the idea that they are not in business for their health, for selling their product for anything less than they can get.

Q. Is it any more reasonable to believe that such would be the case than it is to believe that the laboring men of the country, if they have the fixing of their own wages, would fix that upon a basis that would be agreeable to all?—A. Oh, I do not think they could do that.

Q. Neither do you think that the other side could do it?—A. What was the other side to do? I was not quite clear about that; what did you say about the other side?

Q. I say neither do you think, from what you say, the other side, the manufacturing people, could fix a price that would be equitable and just?—A. No.

Q. (By Mr. FARQUHAR.) In answer to that, you think capital is just as equitable as labor?—A. More so.

ALL INDUSTRIES EXCEPT SUGAR REFINING ARE INORDINATELY PROTECTED.

Q. You spoke of American industries that were inordinately protected by the tariff. Will you please mention a few of them, 2 or 3 of them?—A. I can only do it in a general way, that all those which have a protection of over 10 per cent are inordinately protected.

Q. Can you not mention some business, as you have a very close acquaintance with the tariff? We have a great many trusts being formed in New Jersey, and people do not know what they are; and from your wide experience I should like you to name 2 or 3 of the inordinately protected industries of America.—A. Well, I have said already that there is only one that is not, and that is the sugar industry. All the rest are. That embraces 2 or 3.

Q. All the rest, you think, are?—A. All the rest are; that certainly embraces 2 or 3.

Q. You make a broad assertion, which is hardly as clear as a good many of your answers have been to-day. Now, in your essay as read here to-day and in your testimony, I presume that you have stated business propositions; that you have no theories to advance, but that it is the practical business of the country that you have presented to us?—A. Yes. I hope the commission will expunge everything that is objectionable. [Laughter.]

THE TRUSTS A NATURAL EVOLUTION.

Q. You are aware that there is a notion in the country that these companies and combinations are very much in the character of commercial conspiracies; that is the general opinion about trusts?—A. Yes.

Q. You take this view of it, do you not, that as a business proposition a trust, or combine, or great capitalized association is simply the survival of the fittest in business?—A. Precisely.

Q. Exactly, and on that you rest all your political philosophy, that the best is going to win in the long run?—A. Yes.

Q. And the most money is going to have the best of it in any market?—A. I had rather have the brains than the money.

Q. You need the brains and management as well as the money?—A. Yes.

Q. And there ought to be an open field for one hundred and fifty million equal to one hundred and fifty thousand?—A. Yes; providing the Government does not step in and say: "My dear fellow, you are going into business? Yes. Whether you need it or not, I will give you 50 per cent, and I am going to give it to you whether you want it or not. Go after it and fleece the public to that extent." You eliminate that from business, and hands off. Every fellow for himself and the devil take the hindmost.

Q. Now, another question, not so much on business. Do you think that when you advocate these great combinations and powerful commercial bodies, take it all in all, it is serving the well-being of the people of the United States to have that class of great associations in it? Does it serve the well-being of all?—A. Eliminate the advantages under the tariff and it is the proper thing. It furnishes to the community, the mass of the people, all products at the cheapest possible price, and that is what they are interested in. If I pay a man \$1.50 a day, and he can buy from a trust his sugar, his milk, his beef, or anything he uses at prices in all things cheaper than he was able to do before, he saves and makes money as against forcing him to buy from this wonderful individual you are talking about, that must be supported or maintained by a wet nurse called the Government. I tell you, gentlemen, the day of the individual has passed.

Q. (By Mr. KENNEDY.) The wet nurse is the United States. Is that what you mean?—A. Yes; I call the wet nurse over 10 per cent of the tariff, although I still have to go on my 8 per cent.

Q. (By Mr. FARQUHAR.) That does not seem to answer the question. We have in this country, speaking broadly, bills of rights that apply to every individual, and one man's dollar is just as good as another man's dollar unless there is a lien or a judgment back of it. Every man has the right to his liberty and his pursuit of happiness and his business. Now, the broad question put to the American people is this: Are not the great combinations that you speak of against the well being of the people of the United States and the individuals that are in business of the same character in the United States?—A. If the mass of the people profit at the expense of the individual, the individual should and must go.

Q. You have mentioned the fact of the consumer profiting from the lowering of prices. You have also given testimony here that you have only lowered prices when competition hit you; there was neither philanthropy in it nor sentiment. Do you mean to say that about this?—A. I told you that the business of the Sugar Company was conducted on lines that furnished the consumer cheaper sugar than he had been getting, consistent with a fair profit on the capital and the extent of the whole business, and that we had been seriously interfered with lately by the competition of outside refineries.

Q. (By Mr. KENNEDY.) Has there been any dangerous outside competition?—A. Oh, most dangerous and ruinous.

DIVIDENDS AND STOCK OF THE SUGAR TRUST.

Q. (By Representative LIVINGSTON.) Did you answer or not the question: What were the dividends paid by your company; what per cent? Do you mind answering that?—A. The question as to what we have paid has not been asked.

I think it has averaged about 10 per cent on the entire capital; 7 per cent on the preferred and 12 on the common; that makes an average of 10 on the whole.

Q. Now will you mind going a step further and say what your profits for 12 months were?—A. I wish I knew.

Q. (By Mr. PHILLIPS.) Have you stated the amount of capital stock in the American Sugar Refining Company?—A. \$75,000,000.

Q. (By Representative LIVINGSTON.) One thing further. Did you pay the last dividends out of the earnings or out of the surplus?—A. I did not mention that.

Q. Do you mean to say you would not like to answer that?—A. I mean to say that I did not mention it.

Q. (By Mr. PHILLIPS.) Do you refuse to answer that question?—A. I think it had better remain as it is, Mr. Chairman.

EFFECT OF THE TARIFF ON SUGAR RESUMED.

Q. (By Mr. JENKS.) I want to see if we can bring out a little more clearly your views with reference to the present tariff and the tariff of one-fourth of a cent a pound which you have advocated. Under present conditions, as you have emphasized, there is no foreign refined sugar imported. Do you think that, if the price here were to go up, so that you could make what you consider a fair profit for the American Sugar Refining Company, refined sugar would be imported?—A. It would not with a protection of one-fourth of a cent; it would otherwise, I think.

Q. You think it would with a protection of one-eighth of a cent?—A. Yes.

Q. That was the point, I think, that was suggested before. Now is it the competition that has forced prices down so low?—A. Local competition, yes.

Q. The basis on which you fixed the price of sugar so as to return to the American Sugar Refining Company one-fourth of a cent profit (which you said was your general principle), was what you thought in the long run, taking possible competitors into account, would pay to the American Sugar Refining Company the greatest net returns?—A. Precisely.

METHODS OF CONTROLLING TRUSTS OR INDUSTRIAL COMBINATIONS.

Q. We have in connection with the railway system of the country the Interstate Commerce Commission, and we have reports made to them with reference to the condition of the business of the different railroads. Can you give any reason why your business should not be made as open to the public as is the business of any railroad? I am not asking now for a technical legal answer, but for an answer on general business principles, the economic basis.—A. There is always an aversion on the part of business men to expose their business to the advantage of competitors, and it is most probable that in case they did give the Government an opportunity to examine their books their condition and methods would leak out to the injury of themselves and the advantage of their competitors.

Q. Would they be likely to be injured any more than the railroads are?—A. Yes; railroads run in certain districts. It is difficult to get a competing charter. Refineries can be built anywhere at any time.

Q. Simply because railroads are more of a natural monopoly than refineries?—A. Yes; that is the way to put it.

Q. Not, you think, that the people as a whole have any less interest in a sugar refinery as a consumer than they have in a railroad?—A. I think people as a whole have more interest in articles that are a matter of food than they have in matters of transportation.

Q. So that, from the standpoint of the general public interest, if that can count for anything, there is more reason why the Government should get reports from the American Sugar Refining Company than from the railroads?—A. I think it possibly follows that where a corporation like the Sugar Company, or any other large food producer, takes on a quasi-public character, there is more reason why the public should know in reference to it.

Q. You do not consider, then, that the American Sugar Refining Company is of a quasi-public nature?—A. Well, as far as that is concerned, considered from the public standpoint, it is within their power so to consider it whether I want to or not. The power is there, and I have always maintained that we got this protection law in the confidence imposed in the American public, and they had the power to maintain or destroy it. If we could ever get beyond the senseless clamor against trusts, and could get the proper treatment of them into the deliberate consideration of those who have the matter in charge, I think the industry would be treated fairly. But votes will knock out framers of bills any time, and the votes have always been against us.

Q. Your own deliberate judgment is that if the inspection could be made fairly and honorably of the books of all corporations that are of this general nature, and if reports should be made regularly, it would be for the benefit of the people and presumably for that of the corporations concerned?—A. It would be the means of giving those who had legislation in charge some more accurate data upon which to base their judgment and votes, and I really believe that until some such course is adopted industries in this country are in very great danger of very radical changes. If the Republican party, while it is in power, would gradually reduce this inordinate protection that prevails, it would be a very wise thing.

THE EFFECT OF THE TARIFF ON TRUSTS RESUMED.

Q. (By Representative LIVINGSTON.) I gather this to be the sense of your statement, that we have got protection so much from foreign competition that it has bred a species of domestic competition to the extent that it is about to smother the whole business.—A. That applies to the sugar business.

Q. I understand. I want to ask you if it applies to every other protected industry in the country; if it applies to the Oil Trust, to all the trusts, every one of them? If I understand, the Sugar Trust, the Oil Trust, and every other trust that is under the protective system in this country has been bolstered up against foreign competition until they have built up a domestic competition which will absolutely throttle every one of them?—A. Unfortunately, you know, the trusts intervene there and knock that argument out.

Q. Is not that the difficulty you are laboring under to-day?—A. Oh, precisely.

Q. Now if Rockefeller were here I would ask the same question and he would answer the same as you do?—A. Well Rockefeller does not benefit by the tariff at all. I have got the tariff bill here and I looked it up this morning, and there is no tariff on petroleum.

Q. You complain that you are not making money. The time was when you did make money. That is true?—A. Yes.

Q. Is it the truth that under the protective system of our Government foreign competition has been so fought back and kept back that there has been such a margin of profit at home that we have been crippled or kept back from competing with them only by this competition at home? Is not that the trouble with the whole business?—A. Undoubtedly; but trusts intervene and correct it to the extent of the tariff.

Q. You, then, take the position that a trust can intervene also and take the place of the tariff?—A. No, no; you and I fight each other to death under a protective tariff. Now, we get a protection of 5 cents and we heal our differences in 5 minutes.

Q. In other words, by combination you get rid of the trouble?—A. By the trust; that is what these combinations are called, aggregations of capital which are usually known as trusts.

Q. I put those two things together, first that the protective system has brought such domestic competition that you are compelled to form a trust to keep each others' throats from being cut?—A. That is just the case with sugar. Have I not just told you that prior to the formation of the Sugar Trust 18 companies went out of business, failed, were ruined, and that is the advantage of the tariff? But if you do not stick to real protection in itself, but give these producers 40 to 60 per cent, then they are bent on mulcting the public. The great trouble is the tariff, and there you are.

Q. (By Mr. JENKS.) I judge from your answer to Colonel Livingston's question with reference to the gradual reduction of the tariff that you possibly did not mean in your statement that 10 per cent was to be taken literally, applying all the time?—A. I mean that 10 per cent expresses the real difference between the cost here and abroad. I had to fix some figure, and I said about 10, because I believe that is so. In some cases it might be 15 or 20, and I said in sugar it is 8; but I did not mean to propose anything to be introduced into tariffs that are going to be radical or injurious. There should be enacted into law now some remedy against this inordinate duty or protection.

Q. And speaking broadly, you think 10 per cent would be as near it as anything that can be stated in general terms?—A. Yes.

METHODS OF CONTROLLING TRUSTS RESUMED.

Q. One word further with reference to the question of publicity. If I understood you correctly, you would yourself favor any bill that should be introduced that would provide for public reports of all corporations if you thought the law

would be administered fairly and honestly?—A. Well, that requires more thought than I am able to give it at the moment. Of course my individual opinion might be one thing, and as a representative of the American Company without being charged with permission to make any statement, it might be another. I can see no real harm in exposing the affairs of a corporation to governmental inspection, providing some means can be provided to protect that exposure from the advantage of the competitors.

Q. (By Mr. FARQUHAR.) You would say that, on the same line as bank examiners do their work, the credit of the concern should not be given away, nor its manner of doing business, but an examination as to the character of the business proper itself is right; is not that it?—A. I will state broadly that where a corporation is dealing particularly in things that are essential to the benefit of mankind—clothing, fuel, oil, sugar, rice, food—anything which is peculiarly, as I have described it, of a quasi public character, it would be beneficial to the public to have them all under governmental superintendence.

Q. (By Mr. NORTH.) Will you answer one question more? Do you export any product of the American Sugar Refining Company?—A. We export molasses.

Q. No sugar?—A. No sugar.

Testimony closed.

WASHINGTON, D. C., June 15, 1899.

TESTIMONY OF JAMES N. JARVIE.

The commission met at 2 o'clock p. m., June 15, 1899, Second Vice-Chairman Gardner presiding. Mr. James N. Jarvie, 71 Water street, New York City, was sworn and testified.

Q. (By Mr. JENKS.) Will you be kind enough to give your full name and address to the reporters?—A. James N. Jarvie, and my summer address is Glenridge, N. J.

Q. And your business address is?—A. 71 Water street, New York City.

MEMBER OF THE FIRM OF ARBUCKLE BROTHERS.

Q. You are engaged in the sugar-refining business?—A. That is one of the departments of our business.

Q. You are a partner in the firm of Arbuckle Brothers?—A. I am a partner in the firm of Arbuckle Brothers.

Q. How long have you been engaged in the sugar-refining business?—A. Practically since 1897; that is, we started to build a refinery in January, 1897—plans, etc.

Q. When did you begin to put the product on the market?—A. August, 1898.

THE MARGIN BETWEEN RAW AND REFINED SUGARS.

Q. At the time you started to build a refinery and for some time before what had been the margin between raw and refined sugars?—A. About 90 points.

Q. And what has been the margin since you began putting your product on the market?—A. When we started to sell sugars the margin was between 80 and 90 points; since we have been selling sugars the margin has gotten down as low as 52 points; to-day, or yesterday, it was 51 points.

Q. About what time did this cutting in prices begin?—A. I should say in September, 1898.

Q. Very soon after you began putting your product on the market?—A. Yes.

Q. Did you begin cutting in order to dispose of your product?—A. I don't think we did. We followed the prices made by the American Sugar Refining Company.

Q. You have done that regularly—let them fix the prices, you following?—A. We have done that regularly, with perhaps an exception. Where we knew they were cutting prices secretly we made the price an open one.

Q. But you have never made a price lower than their open market price, unless you had reason to believe they were cutting secretly?—A. No, never.

THE MARGIN NECESSARY FOR A PROFIT.

Q. About what do you consider the margin between raw and refined sugar necessary for a sugar refinery to make a profit? What is the lowest margin on which one can refine sugar and get out even, without losing money?—A. Well, I will have to say from 50 to 60 points.

Q. There is more or less variation in the cost of refining?—A. Yes.

Q. What are some of the circumstances that affect that?—A. Well, generally the amount that a refinery turns out compared with what they can turn out.

Q. Speaking generally, then, you would say that when the margin gets below 50 cents a hundred the presumption is that the refineries are running at a loss?—A. Yes.

Q. At the time that you started in with your refining business you said the margin was in the neighborhood of 80 to 90?—A. Yes.

Q. With the margin at 85 or 90, you would say that the margin of profit is about how much?—A. Well, if it costs 50 to 60 cents to refine, it would be the difference between that and 85 points; that would be from 25 to 35 points.

Q. What do you mean by a point?—A. One one-hundredth.

Q. The fair presumption would be, then, that while the American Sugar Company were selling sugars with the margin from 85 to 90 they were making somewhat more than one-quarter of a cent profit?—A. I can not answer that question. I do not know what it costs them to refine.

Q. Since you have been running your refinery have you been in conference with the American Company with reference to consolidation, agreements on prices, and so on?—A. No.

COST, CAPACITY, AND OUTPUT OF REFINERIES.

Q. In order that one may be able to make a fair judgment with reference to capitalization, it is necessary to know something with reference to the cost of building refineries. What, in your judgment, at the present time would be the cost of building a modern up-to-date refinery that would be able to melt a million pounds a day?—A. I should say \$2,000,000; but the location of the building would change that somewhat. If the buildings are on the river front, of course it is more expensive to get foundations, and that might be changed, owing to locations.

Q. In this estimate of \$2,000,000 you are not including the real estate?—A. No.

Q. About how many barrels of output would that be—a million pounds melting?—A. About 3,000 barrels.

Q. (By Representative LIVINGSTON.) He does not say whether that is daily, weekly, or monthly, or what.

Q. (By Mr. JENKS.) I had spoken of the daily output; you mean about 3,000 barrels a day?—A. Yes.

Q. The American Sugar Refining Company was made up of a number of different establishments working in harmony. In your judgment, are there any special advantages as regards the cost of refining from a number of separate establishments working together?—A. Under some conditions there might be.

Q. For example?—A. But, if you want to compare it with our business—

Q. That is perhaps the most definite way; yes.—A. I don't think they can refine sugar and sell it any cheaper than we can.

Q. Your establishment, you would say, then, is large enough and so equipped that you can have all the advantages from division of labor, and so on, that they can?—A. We think it is.

Q. Can you give us any information with reference to the present tariff on sugar, as to whether it is sufficient to cover the difference between the cost of refining abroad and the cost of refining here?—A. Well, I have been too short a time in the business to express an opinion on that. I should prefer to have others speak on that who have been in the business longer than we have.

THE COST OF REFINING SUGAR.

Q. Are you familiar with the cost of refining abroad?—A. I am not.

Q. (By Representative LIVINGSTON.) What is the cost of refining sugar in your plant?—A. I would rather not answer that.

Q. But I want you to answer it.—A. I think that is giving our competitors an advantage that you should not ask us to do. I have answered the question that we could refine sugar and sell it as cheaply as the American Sugar Refining Company, and I think that should be sufficient.

Q. Why not answer the question as to what it costs?—A. Is not that sufficient answer?

Q. No, sir; it is not.—A. Then I can not give it to you, sir.

Q. You said that it costs no more in your plant than it does in the Havemeyer plant. They can not have any advantage of any answer you might make to this question. Why not answer it?—A. Because we might be doing it for less than they were doing it; that would be an advantage.

Q. Suppose they were?—A. I don't think it is necessary to make our business public; we are not a corporation; we are a firm.

Q. I understood you to say, in answer to a question by Mr. Jenks, that there never had been any attempt to reconcile the difference between the Arbuckles and Havemeyer combination. Is that your answer?—A. Well, I don't think he put it exactly that way; did he?

Q. I put it that way.—A. We have had 50 people make the attempt we presume, for stock-jobbing purposes. Arbuckle Brothers are in the sugar business to stay in the business.

Q. I understood that; but so are the American in the coffee business to stay, too. Now, what is the basis of settlement between you two?—A. We have no basis of settlement.

THE COFFEE BUSINESS.

Q. (By Mr. JENKS.) Perhaps you will tell us with reference to the coffee business, since the American Sugar Refining Company went into it, what the prices of green and roasted coffee in the form in which you sell it were at the time you went in and what the prices are now, and what has been the apparent effect on the business of the American Sugar Refining Company going into it. Will you be kind enough to make a brief statement covering that question?—A. The American Sugar Refining Company, we believe, bought the Woolson Spice Company in January, 1897, or December, 1896. The price of roasted coffee at that time was about 15 cents; the price of green about 10 cents—that is, the grade it is presumed they were using. The price to-day of roasted is 8½, and the grade they are using is about 6 cents—grade of green coffee. Now, our price of roasted at that time was 15 cents, and the grade of green we are using is now more than 6 cents in value. Our price for roasted is 9 cents; but it is only fair to state that it was not the so-called coffee war that reduced the price of coffee.

Q. What was it?—A. Why, it was the increased production of coffee all over the world. The coffee crops have increased from 11,000,000 to about 15,000,000 bags in the last 3 years.

Q. That would reduce the price of green; how about the margin between green and roasted?—A. On percentage there is very little difference; that is, 6 cents for green and 9 cents for roasted is 50 per cent; 10 cents for green and 15 cents for roasted is 50 per cent. You must bear in mind that a pound of green coffee only turns out—or 100 pounds of green coffee only turn out 84 pounds of roasted coffee, and there are other things with reference to the manufacture the prices of which are fixed.

Q. How about the profits at the present time as compared with what they were earlier, at the time the American Sugar Refining Company went into the business?—A. Much less.

PRESENT CONDITION OF THE SUGAR BUSINESS.

Q. (By Mr. KENNEDY.) May I ask: Are the Arbuckle Brothers making money now out of the sugar business?—A. If you mean to-day, I can not tell you that. I have answered that it took 50 to 60 points of a margin between raw and refined to make a profit on sugar. Now, the margin to-day is 50 points, but it has only been that for the last week.

Q. (By Mr. JENKS?) Before that?—A. Before that it was 40 points and a few weeks prior to that it was 32 points, so it is rather a difficult question for me to answer.

Q. For about how long a time has the margin been below 50 points?—A. I should say several months.

Q. (By Mr. KENNEDY.) Then as the American Sugar Refining Company is paying dividends on a large overcapitalization, is it not very probable that it is losing money to-day in the sugar business?—A. I do not want to say anything about the American Sugar Refining Company; I know nothing about it beyond published reports; we have no connections with them whatever and know nothing about their business other than their being competitors.

Q. (By Representative GARDNER.) As an abstract question, you would say that a company refining sugar at this time and selling it at 80 to 40 points above the cost of the raw were losing money, would you not?—A. I am under that impression.

Q. (By Mr. JENKS.) About what is your output in barrels per day?—A. At this time from 2,800 to 3,500 barrels.

Q. (By Mr. KENNEDY.) What is your capacity?—A. Under favorable conditions, about 4,000 barrels.

Q. Can you state anything about the output and the capacity of other independent refineries?—A. I can not; I can not say what their output is or their capacity. I don't know.

Q. Do you believe that the American Sugar Refining Company has an output of 90 per cent of the consumption of the country?—A. I heard it was so stated here yesterday.

Q. I want to ask your opinion about it.—A. I don't think they have; but of course I don't know.

Q. (By Representative LIVINGSTON.) What per cent of the output do you send out?—A. You mean to say the output of the country?

Q. The consumption.—A. The consumption of sugar is supposed to be about 2,000,000 tons. It will vary from that this year; the consumption seems to be larger than last year.

Q. What percentage of that do you put out?—A. If we have a capacity—do you mean to say capacity or what we are really selling?

Q. What you do, not what you can do.—A. We refine as much as we can sell.

Q. (By Mr. JENKS.) Do you recollect about how much it was last year?—A. I can not tell you that.

Q. (By Mr. RATCHFORD.) I would like to ask the witness as to where he finds a market for his product—western markets entirely?—A. No; all over the country, east of the Rockies; it depends entirely upon railroad rates of freight.

Q. In your market, then, extending all over the country, you meet in competition the product of all other refineries in the country, do you?—A. It depends upon the rates of freight entirely. We have sold sugars in San Francisco.

NO FOREIGN COMPETITION AT PRESENT.

Q. Do you come in competition with the products of foreign countries?—A. Yes; when they are here.

Q. When are they here? Where do you meet them?—A. The margin between raw and refined has been so small that there has been no foreign refined sugar here this year.

Q. Then you are not affected in your sugar business by any foreign competition?—A. The margin has been so small that it has been impossible for foreign refined sugars to come in.

Q. (By Mr. JENKS.) Do you recollect about what the margin was at the time the last foreign sugar was coming in?—A. I can not tell you.

Q. You have not that in memory?—A. No.

WHY THE ARBUCKLES WENT INTO THE SUGAR BUSINESS.

Q. Is not the house of Arbuckle Brothers a general grocery house?—A. Arbuckle & Co. was the original house of Arbuckle Brothers. They started a wholesale grocery in Pittsburg in 1858. They came to New York in 1870 and made a specialty of coffee, of roasted coffee in pound packages.

Q. You have the Pittsburg house yet?—A. Yes.

Q. It is a general wholesale grocery house?—A. Yes.

Q. You went into the sugar-refining business simply as an auxiliary or adjunct to your general trade?—A. We went into the general sugar-refining business because in our coffee business we had bought a machine for filling, packing, and weighing coffee, and we thought we could adopt the same for sugar. We started to buy sugar from the refineries, from the different refineries in 1893 or 1894, to develop that industry. We ran it for 3 or 4 years, and found we could not make any money out of buying sugar from the refineries and putting it up in that way and then selling again to wholesale grocers, as we had to compete with other refineries as to price, etc., and we came to the conclusion that the only way to make any money was to build a refinery of our own.

Q. On account of this patent?—A. Yes; which we did.

Q. Are you the exclusive owners of that patent?—A. Yes, we are.

Q. Have you had offers from competing companies to take a share in the patent itself?—A. No, sir.

Q. Did the American Company ever make you any offer at all for the use of that patent?—A. Not that I am aware of.

Q. The use of this patent gives you a considerable margin, does it not?—A. No, it does not.

Q. But for your own trade it is a positive advantage?—A. It is an advantage because no one puts up sugars in that way but ourselves.

Q. In that form for the consumers?—A. Yes, the American Sugar Refining Company recently, as well as other outside refineries, have put up sugars in 3 and 5 pound cotton bags to compete.

RELATIONS WITH THE SUGAR TRUST.

Q. (By Mr. C. J. HARRIS.) Did you have any trouble with the American Sugar Refining Company in handling their sugars that led you to start this new plant?—A. We could not make any money out of it.

Q. Are wholesale grocers who handle this sugar making any money at present?—A. I think they are.

Q. Is there any contract which provides that they shall only handle that concern's sugar, or any restrictions of that kind?—A. I don't know of any such contract.

(By Mr. FARQUHAR.) While you were a purchaser from the American Sugar Refining Company you had no arrangement of that kind, did you?—A. No, sir; none whatever. We had no advantage over any other wholesale grocer.

Q. Wholesale grocer in New York State or elsewhere?—A. No.

Q. (By Mr. C. J. HARRIS.) Since you have established your works and since you started building what has been the attitude of the American Sugar Refining Company toward you? Will you describe that briefly?—A. I don't know any other attitude toward us than that of cutting the price.

Q. Has not their attitude been an attempt to crush you out of business?—A. If the cutting of price is that, yes.

Q. Is not that about as good a way as any?—A. I think so.

Q. And as effective? If they can compel you to run business for nothing long enough that is about as effective a mode of procedure as could possibly be adopted, is it not?—A. Well, when a great company like that is selling 90 per cent of the total product at a loss and letting outsiders sell only 10 per cent, I do not think the outsiders are going to suffer very much.

Q. You do not think the outsiders are going to suffer very much?—A. No; not in proportion.

Q. Well, they simply lose on 90 per cent and you make nothing on the 10, so I do not see that it makes much difference between you. For instance, in the Chicago markets, both companies, your own and the American, had quite strong opposition a short time ago, did you not?—A. Well, I do not know that—you mean besides the other outside refineries?

Q. I mean from the independent refiners there.—A. The independent refiners, no; I do not think there is any trouble between them in that market any more than any other.

Q. There was not?—A. No.

Q. Was there not a possible push in the Chicago markets within some months where Arbuckle Brothers came in open competition there with the American Sugar Refining Company?—A. We have been in open competition with them in all markets.

Q. There was no particular overdevelopment in the Chicago matter at all?—A. No.

Q. (By Representative LIVINGSTON.) Does the American Sugar Refining Company, or Havemeyer enterprise, have any advantage compared with you in freights?—A. I do not think that they have.

Q. (By Mr. FARQUHAR.) Since 1896, say, how many new independent refineries have commenced business?—A. The New York Sugar Refining Company and ourselves.

Q. (By Mr. JENKS.) This New York Sugar Refining Company is the Claus Doscher Company?—A. Claus Doscher; yes. These are all I recollect; I know of no others.

COST OF REFINING SUGAR RESUMED.

Q. (By Senator MALLORY.) What does it cost in this country to refine sugar from the average 96 polariscopic test of raw sugar centrifugal?—A. I think I have answered that question by saying from 50 to 60 points, or one-half to six-tenths of a cent per pound. In other words, if raw sugar costs 4½ cents a pound, it will cost over 5 cents up to 5½¢.

Q. That is actual cost?—A. Yes.

Q. Do you refine raw sugar from beets as well as cane sugar—both?—A. We do.

Q. Do you know what it costs in Germany to refine sugar from the same standard of raw sugar?—A. I do not. In Germany they refine sugar directly from the beets. They have a different process entirely.

Q. They refine beet sugar directly, I believe?—A. They do not require any bone black, which is quite an expensive item in the refining of sugar.

Q. You do not know, then, whether they make their refined sugar at a cheaper rate relatively than we do?—A. I do not know, but I do not believe they do.

Q. In Germany, I believe, they have a bounty on all refined sugar exported?—A. Yes.

NO FOREIGN COMPETITION AT PRESENT RESUMED.

Q. I understood you to say there was no foreign competition at present in refined sugar in this country?—A. Yes.

Q. When was the last foreign competition that you had to compete with?—A. Well, we never have had any foreign competition since we have been in the business. The margin has been so small that there has been no opportunity to bring in the sugars, that is, any amount of them. A small amount may have drifted in, in some way or other.

Q. Do you apprehend that there will be?—A. Not until the margin gets greater than it is to-day.

Q. At what figure of margin would there be a probability of foreign competition coming in?—A. I can not answer that definitely; I do not know; we have not been long enough in the business to know that.

THE TARIFF.

Q. (By Mr. FARQUHAR.) As a business proposition, is it the price of the raw product of the American Sugar Refining Company, or is it the tariff of one-eighth of a cent that excludes foreign refined sugars? Is it the present cost of the raw sugar or the tariff of one-eighth of a cent that keeps out the foreign refined sugars from the American market?—A. I think it is the margin between raw and refined sugars that keeps them out, and I think if that margin were increased by one-eighth of a cent there would be but little come in.

Q. (By Representative LIVINGSTON.) You mean to say it is the tariff that keeps it out; that is, the tariff is so low?—A. Under ordinary conditions, yes; the tariff being low would not keep it out.

Q. Is it not low now?—A. I am not familiar enough to answer that question.

GENERAL IMPRESSION THAT IT IS NOT SUFFICIENT.

Q. (By Mr. FARQUHAR.) You can not answer that question, whether the present tariff is insufficient to keep out the foreign refined sugars? Insufficient to keep it out of itself?—A. As I said before, we have not been long enough in the business to answer that; if we had been, I could answer it. I can give you the impression that prevails among sugar men generally.

Q. That is what we desire.—A. That the tariff is not sufficient.

Q. (By Senator MABLORY.) The reason why there is no foreign competition is ascribable to the low rate at which sugar is sold in this country at the present time, as I understand it?—A. No; I think it is ascribable to domestic competition.

Q. Domestic competition?—A. Yes.

Q. (By Mr. JENKS.) Just a little further. You say that the prevailing impression among the refiners is that the present duty on refined sugar, above that on raw sugar, of substantially one-eighth of a cent a pound, is not enough to keep out foreign sugar. Is the prevailing opinion also that this discriminating duty in favor of refined would be sufficient if it were raised to a quarter of a cent a pound?—A. A quarter would help.

Q. Would that be sufficient? Is that the general opinion?—A. I think it would.

Q. You think that the addition of another eighth would afford effective protection—you think that is the general impression?—A. I think so.

IF THERE IS NO FOREIGN COMPETITION, WHY SHOULD THE TARIFF BE INCREASED?

Q. (By Representative LIVINGSTON.) Right there on that point. If the eighth produces a lot of domestic competition, why would you have a quarter?—A. I did not quite catch the gist of your question.

Q. You had agreed before my question that an eighth was not sufficient to keep out the foreign competition, and the reason why it was kept out was the domestic competition. Then, if under only an eighth differential on refined sugar the domestic competition is so great that it keeps out foreign competition, why would you suggest a quarter?—A. Well, I would say that the eighth has nothing to do with the domestic competition.

Q. You get out of it in that way. Is not this true, that when these sugar refineries were combined, constituted, or organized, that the rate on sugar was very high, and that after these combines came into existence it lowered the rate, and that was the trouble with the domestic plants in this country, the lowering of the rate, that is what produced the trouble in this country between the domestic enterprises, and brought this throat-cutting and slashing business?—A. No.

Q. What?—A. I do not think that had anything to do with it.

Q. (By Mr. JENKS.) Do you recall what the tariff on refined sugar was in 1887, when the Sugar Trust was formed?—A. I do not; I was not in the sugar business at that time.

Q. And you do not remember?—A. I do not remember.

Q. (By Mr. FARQUHAR.) Is not it the general opinion among refiners that the cutting of rates in refined sugar in the United States was through the combine throttling, as they call it, all competition? Was not that what brought down the rates of refined sugar in this country?—A. Do you mean to say the prices now between refineries?

Q. Yes.—A. Why, of course it is competition.

Q. Entirely?—A. Yes.

Q. (By Representative LIVINGSTON.) Ask him how that competition was brought about, when you get right down to it.

Q. (By Mr. FARQUHAR.) Now, the commission would like to know just exactly how this competition came about, for and against the American Company and the American Company as against all outside concerns?—A. I shall answer for our own concern; and I have answered that the reason why we went into the sugar-refining business was that we had a machine that we thought, as a matter of convenience to the storekeeper and to the consumer, as well as on the lines of economy, would allow us to enter the sugar business. That is the reason we went into the sugar business.

Q. (By Mr. JENKS.) And the cutting of prices began with the American Sugar Refining Company?—A. I believe so.

Q. And you have regularly followed their prices?—A. Yes.

Q. (By Representative LIVINGSTON.) Would you mind answering this question? Will you be able to follow the reductions if they continue for many months?—A. Well, the future is a sealed book.

Q. (By Mr. FARQUHAR.) In your present frame of mind will you be able to follow them anyway?—A. We are going to stay in the sugar business.

Q. (By Mr. C. J. HARRIS.) What has been the reduction since you commenced up to the present time? We hear that there has been a serious drop in the price of sugar. Now, I would like to know about how much it is.—A. You mean the margin between refined and raw sugar?

Q. Yes.—A. Well, I think I have answered that; I will answer it over again. When we started, in September or August, 1898, the margin was between 80 and 90 points, and since then it has gotten down as low as 32 points. To-day it is 51 points.

Q. (By Representative LIVINGSTON.) You mean 32 cents on a hundred pounds?—A. I mean 32 cents on a hundred pounds.

Q. (By Mr. C. J. HARRIS.) The American Sugar Refining Company, then, made, during most of its career since it has started, 90 points, you mean?—A. That is a matter of record, but I can not recall it.

Q. (By Representative LIVINGSTON.) That is how they got that surplus?

WOULD AN INCREASE IN THE TARIFF HELP THE REFINERS?

Q. (By Senator MALLORY.) I understand that, in your view, the present tariff of one-eighth is too small; that a quarter would be better. Now, supposing Congress should impose a tariff of 1 cent instead of one-eighth of a cent, under that tariff would you be able to do business more profitably than you do now?—A. Well, I have said that the competition at the moment was all domestic. Of course, if you make the difference 1 cent instead of one-eighth of 1 cent per pound, you would practically eliminate the foreign competition.

Q. Well, it is practically eliminated now, is it not?—A. Caused by domestic competition.

Q. Well, whatever it is caused by, there is no foreign competition?—A. At the moment, none.

Q. There would be no foreign competition under an increase, say, of one-half a cent or 1 cent; could not be, I suppose?—A. I should not think so; no.

Q. Now, what I want to ask is, if the business in which you are engaged could be conducted more profitably under such a rate than under one-eighth? In other

words, would you be able to make more money out of the business under a tariff of 1 cent or a half a cent than you do under an eighth of a cent?—A. That is a question I can not answer. Trade conditions would answer that, but I can not.

Q. Would you answer?—A. Trade conditions would answer that, but I can not.

THE TARIFF AT PRESENT OF NO ADVANTAGE.

Q. What I want to get at is whether you derive any special benefit from this one-eighth of a cent that you are getting now; whether that is really anything beneficial to your business. It is not sufficient, as I understand, to keep out foreign competition. What keeps out foreign competition, according to your idea, is the domestic competition that reduces the prices, and therefore the foreign refiner can not get in and compete. Now, if that one-eighth does not keep out foreign competition and there is no means of suppressing the domestic competition, what benefit is the one-eighth to you at all?—A. There will not be any as long as domestic competition goes on.

Q. Would an increased tariff rate have any effect in suppressing or reducing the domestic competition?—A. I do not think it would.

Q. Then there is no way, so far as you see, that the present condition can be bettered by any legislation in regard to the business?—A. No; I believe that the less legislation about the matter the better. Let the American conditions work out their own salvation.

THE EFFECT OF REMOVING THE PRESENT TARIFF.

Q. One moment. You think that the taking off of that one-eighth duty would affect your business?—A. Well, that is pretty fine; I can not answer that question.

Q. It has been stated here that it would be absolutely destructive.—A. I can not answer that, Senator. I want to make the commission as fully acquainted with everything they want to know as I can, and I do not decline to answer the question.

Q. I understand that.—A. I want to make it perfectly clear. I want to make you perfectly familiar with it.

Q. (By Mr. CONGER.) Would you have gone into the business of sugar refining last year if there had been no tariff or no differential of one-eighth of a cent?—A. I can not answer that question. If you will excuse me, I should like to explain why I can not answer that question. Of course, it takes 18 months to build a sugar refinery. Now, our plant would have been ready, and perhaps as a matter of pride we would have gone in whether there was any profit in it or whether there was any duty or differential on foreign refined sugars or not. That is the reason I can not answer.

Q. (By Representative LIVINGSTON.) If Congress should raise the differential from one-eighth to 1 cent at its next session, the Senator asked you what effect that would have. Is not this true that it would completely shut out all foreign competition and quadruple domestic competition?—A. I will not answer about the quadruple part, but I will answer about the other.

Q. How would it enhance domestic competition or increase it?—A. It would not increase it at all; the profit would be too great.

Q. Too great?—A. Yes; it would be made too great if the competition all came from foreign sugars; but I have answered more than once that the competition is among the domestic refiners, and therefore that will make the price.

Q. That exists on the one-eighth?—A. No; not on the one-eighth at all. It exists on the entire amount of sugar sold. The domestic competition to-day is on the 100 per cent of sugar sold in this country.

Q. Answer this question. Take the one-eighth off; will that lessen the domestic competition?—A. To-day?

Q. Yes; take off the eighth.—A. To-day I do not think it would.

Q. Free sugar would not lessen it?—A. Not to-day; no, sir.

Q. Well, would it do it next year?—A. Well, that I can not tell you.

WAYS OF GETTING RID OF COMPETITION.

Q. (By Senator MALLORY.) Do you know of any other way of getting rid of domestic competition than by combination?—A. Yes.

Q. What is it?—A. I think that you would get rid of competition if one man did not want it all—if he were willing to let the others live and get a fair amount of the business.

Q. I understand the great evil to-day with the sugar-refining business in this country is free competition. In other words, for some time past sugar refineries have been doing business at a loss. I appreciate, not only from what you have said, but from what other witnesses have said before us, that there is over-competition. Now, it would seem that no legislation can diminish the competition. We know that by combination competition can be reduced or concentrated in the hands of a few or even of one. Is there any other method by which it can be done that you know of?—A. Why, yes; I could answer by saying it would be lessened if the American Sugar Refining Company should be willing to sell less than 100 per cent of all the sugar sold in this country.

Q. That would reduce it?—A. That would reduce competition if they would be willing to sell less than 100 per cent of the sugar sold in this country.

Q. That would be relying, of course, I suppose, on the philanthropic spirit of the American Sugar Refining Company. The only way, then, you know of reducing competition is to appeal to the philanthropy of the American Sugar Refining Company?—A. Well, I would not want to appeal to it.

Q. (By Representative LIVINGSTON.) Is it not true, as a general proposition, that the only way to eliminate competition in any line—whether it is in sugar or any other line—is by combination?—A. I believe it is one of the ways; I do not mean to say it is the only way.

Q. The Senator asked you if you could suggest any other way except humanitarian philanthropy?—A. I have said, a desire on the part of the largest in the business not to want all the business.

METHODS OF PACKING SUGAR.

Q. (By Mr. JENKS.) Is all of the refined sugar that you sell, or the most of it, put up in barrels, or do you sell some of it in large sacks?—A. The greater part of the refined sugar is sold in barrels.

Q. Do you know whether that is customary with the foreign refiners? Do they sell in barrels or in sacks?—A. Mostly in bags or sacks.

Q. So that one advantage which they apparently have over their American competitors is the package in which it is sold. Do you know about the relative cost of the sacks as compared with the barrels?—A. Well, I doubt if there is very much advantage in the bags; it is exceedingly small.

Q. (By Representative LIVINGSTON.) The waste in sacks is considerably larger than it is in barrels?—A. Yes, and the cost of the sacks is considerable; they have to put sugar in double sacks; the greater part of the refined sugar brought to this country is put in double sacks.

Q. (By Mr. JENKS.) Do you, yourselves, sell any sugar in sacks, so that as regards your own business you could answer definitely as to the relative cost of putting it in sacks and barrels?—A. We sell some in this country. The sack that is sold weighs or holds just about a hundred pounds of sugar. Now the sack that comes from the other side holds usually 300 pounds.

Q. As regards your own sales, you say there is no practical saving, or only a very slight saving, between selling in sacks and selling in barrels?—A. Yes.

Q. If you should sell in large sacks like those that are used by the foreign refiners, would you not make a saving of several cents?—A. It would be very little. It is a package that does not carry well on a railroad and does not handle conveniently.

Q. So that, so far as that one point goes, you think there is practically no advantage that the foreign refiner gets?—A. No.

METHODS OF DOING BUSINESS.

Q. (By Representative LIVINGSTON.) Will you please explain to the commission how you meet the competition of the American Sugar Refining Company at any given point? Take any point you please to illustrate how you meet their competition.—A. We sell at the same price, and we believe we make sugars equally good, if not a little bit better, and we have customers who think the same thing.

Q. If you sell at the same price, what inducement do you give buyers for changing their custom and their business instead of holding to the American?—A. I have said that we make what we think is a little better sugar.

Q. You make better sugar?—A. Yes.

Q. Have you your sugar so branded that the consumer as well as the wholesaler and retailer can discern between the two?—A. The consumer, of course, when he buys 2 and 5 pound packages, will know if he buys Arbuckle Brothers' sugar, and the wholesaler will know it. The consumer will not know it, of course, if he buys

out of a barrel, unless he asks the retailer to show him the head of the package, which he does not often do.

Q. Do you give the same commission to your agents that the American Company pay?—A. We believe we do.

Q. (By Mr. JENKS.) Perhaps you will explain to us what your method of selling is; whether you give rebates to the wholesale dealers; whether or not you have the factor system, and so on?—A. We sell our sugars through wholesale grocers exclusively, and they get a rebate of three-sixteenths of a cent per pound. If they buy in lots of 100 barrels they get 1 per cent extra, and if they pay cash instead of taking 30 days, they get 1 per cent for cash discount.

Q. Are they required to make an affidavit that they have held the price that has been quoted?—A. Not to us.

Q. You never have asked them to make an affidavit?—A. No; not in the sugar business.

Q. Do you in the coffee business?—A. No; in the coffee business there are no rebates such as there are in sugar.

Q. (By Representative LIVINGSTON.) How is that?—A. I say there are no rebates in coffee such as are given in sugar. When a man remits for his bill he remits the net price.

Q. Well, if I understand it, the purchaser, the wholesale grocer, has this advantage in buying from you over and above what he would have in buying from the American Company?—A. No.

Q. What?—A. No; he does not.

Q. (By Mr. JENKS.) In selling your sugars do you employ any traveling salesmen, or do any special advertising?—A. Some, but very little.

Q. Do you employ traveling salesmen?—A. No, sir; we do not. We may have one or two men that are not out for sugar.

Q. They are out for the general business?—A. The general business.

Q. Including sugar?—A. General business, including sugar.

Q. And the advertising for your sugar business is mostly advertising in trade journals?—A. Yes; we have advertised but very little.

Testimony closed.

WASHINGTON, D. C., June 16, 1899.

TESTIMONY OF MR. JAMES H. POST, BROOKLYN, N. Y.

The commission met at 11 a. m., June 16, 1899, Vice-Chairman Phillips presiding. Mr. James H. Post, after being sworn, testified.

Q. (By Mr. JENKS.) What is your full name?—A. James H. Post.

Q. And your residence?—A. Brooklyn, N. Y.

BUSINESS OF THE WITNESS.

Q. What is your business?—A. I am a commission merchant in sugar and molasses.

Q. In what special way are you engaged in the sugar business; will you explain it to us in some detail?—A. We are commercial agents of the Mollenhauer Sugar Refining Company, located in Brooklyn, N. Y., and of the National Sugar Refining Company of Yonkers, N. Y.

Q. You sell their entire product?—A. We buy all the raw sugar used by each refinery, and sell the product of each refinery.

PRICES OF SUGAR SINCE 1887.

Q. Can you give us a statement with reference to the prices of refined and raw sugars for the period covering the time since 1887, when the Sugar Trust, as it was in those days, was organized?—A. Only from the figures prepared by Willett & Gray, which are considered as nearly correct as anyone can secure them. I have a copy of their annual report, if you would like to have it, on both.

Q. Yes; I should be glad to.—A. I notice in one of their statements in the report of January 5, which I brought along, the averages as near as anyone can give them.

Q. Are these the average annual prices or average monthly prices?—A. It gives the average annual prices.

Q. For how long a period?—A. For a period of 9 years; from 1890 to 1898.

Q. Have you any information with reference to the prices of sugar for a period before the organization of the Sugar Trust in 1887?—A. I have no record in regard to that.

Q. What is your opinion with reference to the margin between the prices of raw and refined sugars after the organization of the Sugar Trust in 1887; was that margin increased or lessened?—A. I see the average, according to these figures, shows a decrease in the margin of about 14 cents a hundred.

Q. That takes into consideration how long a period before the organization of the combination?—A. I think it says 7 years.

Q. Do you recollect, yourself, what the course of prices, or what this margin was from year to year, so you could state whether there was an immediate increase in this margin after the formation of the combination?—A. I can not tell without referring to the reports on file.

Q. This decrease begins, I believe you say, in 1890?—A. In 1890; and they give the average before that for a while. It does not give the year 1890—I believe that is the year.

Q. Can you compare the figures there for the years 1890, 1891, 1892, 1893, 1894, comparing the margins between the raw and refined for a period of 5 or 6 years, beginning with the earliest figure that you have?—A. Compared with the earliest, for raw sugar, it is, in 1889, 5½ cents.

Q. Give us the margins, please, between the raw and refined, if they are indicated?—A. No, they are not; I will have to determine each one.

Q. If you can?—A. I see in 1889 it was 1.21; shall I give more?

Q. If you will, for 2 or 3 years, yes.—A. In 1890 it was 0.78; in 1891 it was 0.78; in 1892 it was 1.08.

Q. One year more, if you please.—A. 1893, 1.16.

Q. For 2 years, the years of 1891 and 1892, the margin seems to be decidedly less than for the year preceding or for the 2 years succeeding.—A. Yes.

REASONS FOR THE CHANGE IN THE MARGINS.

Q. Have you any opinion with reference to the cause of this lessened margin in these years?—A. There was a change in the methods of the tariff that accounts for part of it, probably.

Q. Can you explain that?—A. Of course if the tariff was decreased, and it is possible that the changes about the month it occurred would show just about how the average was, you would have to go into detail. I do not know the exact date of the tariff change. It was changed in 1891; 2 cents per pound duty was taken off; then, August 28, 1894, there was 40 per cent ad valorem put on.

Q. Was there any change of the duty at that time that would effect the differential between the refined and raw?—A. It would effect the average; it may have been with the longest series the duty was on or the shortest series the month it was off, and this average is for the year. So it would not show unless you take it by dates.

Q. Was there any further change that would account for the increase in price for these 2 years?—A. The increase in the margin?

Q. The increase in the margin, I mean.—A. In 1894 it was 40 per cent; in August, 1894, we had an additional 40 per cent duty; that would of course change the average for the year considerably.

Q. The increase in the margin came before that time, did it not?—A. The year before.

Q. Do you recollect the additional competition that came in during the two years of 1890 and 1891 in the sugar-refining industry?—A. I think the Mollenhauer Refinery was organized in 1890; the National Refining Company in 1892; I think the McCahan Refinery was built in 1892.

Q. The lowering of prices seemed to be in 1890 first, did it not?—A. Yes.

Q. Covering those 2 years, 1890 and 1891?—A. Yes.

Q. Do you remember about when the Spreckles Refinery of Philadelphia began to work?—A. It was about that time. They had been building for some years. I think they commenced to work probably in 1890. I have not the date here.

THE MARGIN BETWEEN RAW AND REFINED SUGAR AT PRESENT.

Q. How does the margin between raw and refined sugars at the present time compare with the margin of a year ago?—A. In May, 1898, the net price of granulated was 5.08 and the price of raw sugar about 4.81. That is 77 cents margin. I have it in months if you want it.

Q. At the present time what is the margin?—A. 0.51 of a cent, taking the centrifugal as a basis.

Q. This date, when the margin was seventy-seven, you say was what?—A. May 19, 1898, and it did not change very much until October or November.

Q. Suppose you give us the margin in September, then in October and November?—A. In September it was about 90 cents a hundred.

Q. And then you said it began to decrease?—A. In October I think the average was probably 53 cents; I think it was.

Q. And what has been the general course; you need not figure it out for every month, but what has been the general course since that time—since October, 1898?—A. There have been times when it has been as low as 32 cents, and at the present it is 51 cents.

Q. Has it been 51 cents to your knowledge since it dropped in October?—A. Yes.

Q. What, in your judgment, has been the chief cause of this decrease in the margin?—A. Competition of other refineries.

THE WAY THE PRICE OF REFINED SUGAR IS FIXED.

Q. In what way is the price of refined sugar particularly regulated; made known?—A. It is usually announced at the office of the American Sugar Refining Company at 9.30 or 10 o'clock in the morning, and telegraphed to the various brokers all over the country; if the other refiners have changed their prices that is announced, too—or a little later—and also if they change sometimes in the middle of the day, as trade conditions warrant.

Q. You speak of the prices being announced by the American Sugar Refining Company. Is it usually true that the prices they fix are followed by the other refiners?—A. Usually so; yes.

Q. Almost exactly the same?—A. Yes.

Q. The other refiners wait until they know the prices fixed by the American Sugar Refining Company and then they fix theirs?—A. It does not follow that other refiners always change prices when the American does, because there are times when the refiners may have a surplus of refined sugar that they want to continue selling, and there may be times when one refiner has a surplus. The conditions are just regular trade conditions, and vary from week to week.

Q. But in the main the others follow the American in your judgment?—A. Yes.

Q. When there is a condition such as you have just described—when one refiner has a fairly large stock that he wishes to dispose of—what is the difference in the prices?—A. It varies from one-sixteenth to one-eighth.

Q. It hardly ever goes above one-eighth?—A. Not above one-eighth.

Q. By giving some advantage in the terms of delivery he may take orders without any change in prices?—A. Yes.

Q. You would say that in the sale of refined sugar there is what we might call free competition from day to day regularly?—A. Yes.

Q. Will you explain just what you mean by that, because you stated a moment ago that regularly the American Sugar Refining Company fixed the prices and the others followed—will you explain what you mean by free competition under these circumstances, where practically all refiners follow the lead of one?—A. The question of preference of course plays a very important part. Some grocers prefer one brand of sugar over others. Very often the preference of brokers plays a very important part. The brokers are employed to distribute the sugars to wholesale grocers and they are paid for doing it, but each refiner has a special broker, and this broker gives more attention to his sugars than to others. When there are changes noted they sometimes get the preference of the first intimation of the changes, and they are all the time wiring different parts of the country for orders and soliciting a little better terms on delivery or little concessions in some way.

Q. You are yourself the selling agent for the Mollenhauer Refining Company and for the National Refinery?—A. The National and Mollenhauer.

Q. As selling agent for both of these, do you always have the same prices for the products of both?—A. Not always, because, as happened quite recently, the National Refinery had sold its surplus of sugar and the Mollenhauer Refinery was running and wanted to sell more sugar; and therefore our prices for the Mollenhauer was one-sixteenth less. There have been times when changes have occurred in the market, when one of our refiners would say, in order to reduce stock to continue selling at the old prices and when we have sold what we want to we change it.

Q. You have your prices for selling, then, fixed by the refiners you are acting

of the increase in the cost of the iron; of course they are largely built without any wood, that is, altogether iron and steel.

Q. In your judgment then, to build at the present time a refinery of that capacity, what we would call an up-to-date refinery, with the later improvements, would probably cost somewhat more than \$1,500,000?—A. Probably \$1,700,000. The land varies in value from \$250,000 to \$600,000, taking those two as a basis. One of them is located right in the city of Brooklyn, near the water front, where land is valuable, and the other at Yonkers, where it is less valuable.

Q. Can you now give us some idea with reference to the amount of running capital that is required in order to run fairly satisfactorily a refinery of that capacity?—A. You mean taking one refinery?

Q. Yes.—A. It would take somewhere in the neighborhood—carrying the usual stocks of raw with the usual credits that are given on refined sugar—in the neighborhood of \$2,000,000 for each refinery.

Q. For each refinery?—A. Yes.

Q. About what is the average amount of raw sugar carried; of course it varies greatly?—A. It depends on the market. I suppose the smallest quantity is in the neighborhood of 15 days' supply, which would be 30,000,000 pounds for the two.

Q. The largest varies according to your idea whether the market is low or high?—A. Sometimes it is 3 or 4 times that; at present I think some of the refineries have 4 or 5 months' supply of sugar.

Q. You would think, then, that a refinery costs, with the ground, in the neighborhood of \$2,000,000, and ought to have, under ordinary business conditions, a running capital of something like \$2,000,000 in addition?—A. Yes.

Q. About those figures?—A. About that; yes.

Q. These opinions of yours, I judge, from the way in which you state them, are based on your experience in your own refineries?—A. Yes; as to others I have no means of knowing. Of course there are credits which are used very largely at times which makes less cash necessary.

Q. Owing to the conditions of business you may stock up with four or five times the usual amount so that credit is desirable?—A. Very important.

SOURCES OF THE SUGAR SUPPLY.

Q. Where do you import the larger quantities of your raw sugar from?—A. The two refineries that we represent use largely cane sugars; but of course, during the last 3 years, when the product of Cuba has been so small, we have used a large proportion of beet sugars, and they are produced in Europe largely.

Q. Can you tell the countries in Europe that send here the largest quantities of sugar?—A. I think this paper¹ shows the product of the world and separates the product of each country.

Q. Suppose you select the 4 or 5 leading countries that send sugar to the United States—beet sugar first and afterwards cane?—A. We will say Germany and Austria are the two largest.

Q. (By Senator MALLORY.) Can you give the figures of the shipment from Germany?—A. No; I see the two countries are not separated here. It is a matter of record at the custom-house, of course.

Q. (By Mr. JENKS.) Of course it is a matter of convenience for us to put it in here; you would say Germany comes first and then Austria as regards the shipment of beet sugar?—A. Yes; very little French, hardly any Russian, sometimes some from Belgium and Holland.

Q. These are substantially all beet sugars?—A. Yes.

Q. Now as regards cane sugars?—A. Well of course in normal conditions Cuba is a great source of supply.

Q. Then after that?—A. I suppose you can count Java, where the crop is very large, and then the West India Islands, Demerara, and Hawaii.

Q. Have there been heretofore large importations made from the Philippine Islands?—A. Quite large; yes.

Q. Is there any difference in the quality of the beet sugars that come from the different European countries, or is the quality substantially the same?—A. I believe all beet sugar is substantially the same.

Q. And if there is any difference the price, I suppose, evens it up?—A. Yes.

¹ Weekly Statistical Sugar Trade Journal. Willett & Gray, 91, 93 Wall street, publishers.

COST OF REFINING IN OTHER COUNTRIES.

Q. Are you familiar with the cost of refining sugar in Europe?—A. Only from statements that I have seen.

Q. Can you give us any information with reference to the apparent cost of refining sugar in Germany as compared with the United States?—A. I believe it is considerably less in Germany, because they take beet sugar and make it into refined in one process, just as they are doing in Nebraska, California, Michigan, and New York. There is no bone black used at all; it is a filtering process. That, of course, does not give as good a quality, but it answers the purpose.

Q. Then you would say that if we wanted to import refined granulated sugar from Germany it would be inferior in quality to our refined sugar?—A. Yes.

Q. Can you give an opinion that is at all definite with reference to the difference in the cost of refining there as compared with what it is here—how many cents per 100 pounds?—A. Probably 15 to 20 cents a hundred pounds less than here.

Q. Is the difference as great as that, in your judgment?—A. I think so; yes.

Q. Does that include any difference in the cost of the package in which it is put up?—A. Partly.

Q. Will you explain to us what the difference in the package is?—A. The principal call for sugar in this country has always been in barrels which cost from 35 to 38 cents a piece. The foreign sugar is packed in jute bags, and therefore is less expensive.

Q. Can you give any information at all as to the cost of those jute bags?—A. No. The refined sugar which is packed in bags in this country is in 100-pound bags, first in a cotton bag, and then a jute bag, which of course adds to the cost.

Q. What is the cost of the bags that are used in this country?—A. For the same quantity of sugar, it is practically the same. We sell the barrels and bags at the same price, and in figuring the cost we think there is not enough difference to consider that at all between the bags and barrels we use.

EFFECT OF THE SUGAR TRUST ON THE PRICE OF RAW SUGAR.

Q. Have you been able to trace any direct influence of the American Sugar Refining Company on the price of raw sugars?—A. They of course have a very large influence on it, because they are such large consumers of raw sugar; but they have not the power of making the price for any length of time for raw sugar. Europe with its larger production of beet sugar fixes the price. They make there, I think, nearly 5,000,000 tons of beet sugar, as against 3,000,000 tons of cane sugar produced in the world.

Q. So you would say that the price of raw sugar is substantially fixed abroad?—A. Fixed in London, Germany, and France.

Q. How long have you been engaged in the business of buying and selling sugar?—A. Our firm has been in it for 35 years.

Q. And you personally?—A. I have been connected with the firm 25 years—from boyhood up.

Q. You have been actively engaged in that firm?—A. For the last 15 years; 10, say.

Q. It has frequently been asserted that the American Sugar Refining Company, on account of the large amount it buys, has been enabled to exert a steady influence toward depressing the price of raw sugars. I should like to know if, in your judgment, this tendency has been appreciable from the time the Sugar Trust was formed?—A. I think it must have been, from the large amount of sugar they use.

Q. Would you be inclined to think that the price of raw sugar has dropped or has been held, let us say, 10 cents a hundred less than it would have been if there had been the former competition among small independent establishments instead of one great buyer?—A. No; I do not think the difference would have been as great as that; possibly one-sixteenth of a cent, and only for periods of a year. Taking the world as a basis, they can not affect it for any great length of time more than one-sixteenth of a cent a pound, because the product of sugar is not very much more than is required for consumption each year. The production is not increasing as fast as consumption is. I believe statistics show that.

Q. You are referring now to the world product, or to the United States?—A. The world product.

EFFECT ON THE PRICE OF REFINED SUGAR.

Q. In your judgment has there been any restriction of the output of refined sugar in the United States for the purpose of keeping the prices higher than they otherwise would be—deliberate restriction of the output?—A. There is no doubt that at certain periods of the year when the consumption is less than it is at other times the production is curtailed, no doubt as a business principle, to meet the requirements. It is very evident that if we all should make all the sugar we could there would be no way of marketing it at a profit.

Q. And in this adaptation of the supply to the normal demand the American Sugar Refining Company, I suppose, of necessity takes the lead?—A. There is no way of telling whether they do their proportion of it or not. I have no way of knowing. Of course we see the public statements from week to week of the meltings, as made up by Willett & Gray, and we know what our meltings are from day to day, but as to whether we are getting more than we ordinarily would have I have no way of telling. Of course, I do not think that the meltings are always stated correctly. I do not think it is possible to get at it, taking the country as it is.

Q. This lessening of the output comes regularly, of course; when the price goes down so that it becomes less profitable and more difficult to market then they lessen the output?—A. Naturally, when the profit is good we make all we can, and when the profit is not enough we make as little as possible. For some months past we have made very little.

Q. Is your refinery running now?—A. The Mollenhauer is at present. The National will be in a few days.

Q. About what proportion of its capacity is the Mollenhauer running now?—A. They are running full just at the present time, but taking the last 6 months I suppose they averaged, taking the two refineries, about one-third of their capacity. Of course it has been unprofitable.

METHODS OF SELLING SUGAR.

Q. Will you explain to the commission the methods that are followed by the refineries and by yourself as agent of the refineries in placing your sugars upon the market? The factor system—does that exist yet?—A. That is in existence in some cities and some parts of the country, and up to the last 5 or 6 months has been the principal way of distributing the sugar.

Q. Explain to us in brief what this factor system is?—A. I take to-day's basis as an average. The price of granulated sugar is 5½ cents. From that we allow to the grocers, without regard to whether they are factors or not, three-sixteenths of a cent a pound, and if they buy 100-barrel lots we allow them 1 per cent trade discount and 1 per cent for cash in 7 days. They can avail themselves of this 1 per cent discount or not, just as they wish. At the end of the 3 months we send them a check for the three-sixteenths of a cent per pound commission, less 1 per cent, regardless of whether they have maintained the list prices or not.

Q. The custom used to be to require an affidavit?—A. Some years ago we required an affidavit as a means of protection to the grocers, not to the refineries. You can readily see that the price at which the grocers sell sugars is of very small interest in one way to the refineries, but it is such a large proportion of their business—I think refined sugar is about one-third of their sales—and competition is so keen throughout the country to sell sugar that for a good while they did it without any profit. At their request this method of selling sugar was adopted by the refineries. It not only applies to sugar, but to a good many other articles. It covers also tobacco, coffee, and various articles. We believe three-sixteenths of a cent per pound pays them the cost of distributing the sugar and a little profit. It gives them a small profit, certainly as small as anyone would be warranted in doing business for, possibly 15 or 20 cents a barrel.

Q. In your judgment is the price that is fixed by the refineries kept up fairly well by the wholesale grocers, since you have dropped the affidavit system?—A. I am sorry to say it is not, for their sakes, not for ours.

Q. Among the grocers themselves, then, you think there is a great deal of cutting under these prices?—A. No doubt of it.

Q. You say the grocers in a large proportion of the markets are selling sugars practically without any profit at all?—A. Yes; there are certain sections in the country where I think profits are maintained—New York, New England, and Pennsylvania, but west of that, excepting in one or two States, I think the profit most all the time is nothing.

Q. You think in the eastern States they do substantially maintain the prices?—A. Yes.

Q. Are there any other systems of selling sugar, factor systems, and so on?—A. There are different States that have systems of their own; take Ohio, for instance. It was found under some interpretation of the law that it was illegal to hold three-sixteenths of a cent commission and in that State we deduct from the bill instead of holding it, so that every grocer is allowed three-sixteenths right on the face of the bill. They have recently adopted a plan which they hope will be successful in helping them to maintain the profit on sugar.

Q. Can you explain to us what the plan is?—A. Well, I have two circulars here; they are printed documents and I think there is no secret about it. I am very willing to leave them here if you care to have them.

Q. Will you be kind enough to read them to us first, and then put them on file?—A. They are under date of May 18, and May 26, 1899. They are too long to read.

Q. Give us the gist of them; it will be better.—A. The gist of them is that the State has been divided up into certain sections with a committee appointed for each section. They have resolved to maintain a profit of one-eighth of a cent per pound in these sections, and if it is found that any grocery salesman is cutting the price of sugar or coffee and it is proven that it has been cut, the committee in that section notifies all the grocers to reduce their price to the price at which this grocer sold sugar, immediately taking away any profit in that section. That is the gist of it, I believe.

(The two documents referred to are herewith attached.)

[The Ohio Wholesale Grocers' Association Company, Columbus, Ohio, May 18, 1899.]

[Please file for future reference.]

To Ohio wholesale grocers.

GENTLEMEN: At a meeting of the wholesale grocers of Ohio, held at Columbus, May 9 and 10, 1899, a new code of rules and regulations was unanimously adopted. A part of article 4 of the new code reads as follows:

"The board of directors shall divide the State into six divisions, and shall appoint for each division a local board of three members."

At a meeting of the board of directors held in Columbus May 18, 1899, the State was divided into the six divisions as provided in the new code and the following local boards of arbitration were appointed:

No. 1 or northwestern district, composed of the following counties: Williams, Ottawa, Wood, Paulding, Allen, Wyandotte, Fulton, Sandusky, Henry, Putnam, Hancock, Crawford, Lucas, Seneca, Defiance, Van Wert, Hardin. Committee of arbitration for the above 17 counties: R. A. Bartley, chairman, Toledo, Ohio; J. M. Sealts, Lima, Ohio; W. T. Hughes, Van Wert, Ohio.

No. 2 or northeastern district, composed of the following counties: Erie, Cuyahoga, Geauga, Portage, Ashland, Holmes, Huron, Lake, Trumbull, Summit, Richland, Stark, Lorain, Ashtabula, Mahoning, Medina, Wayne, Columbiana. Committee of arbitration for the above 18 counties: J. H. Fitch, chairman, Youngstown, Ohio; H. R. Edwards, Cleveland, Ohio; August Dannemiller, Canton, Ohio.

No. 3 or eastern district, composed of the following counties: Jefferson, Harrison, Guernsey, Noble, Carroll, Coshocton, Belmont, Washington, Tuscarawas, Muskingum, Monroe, Morgan. Committee of arbitration for the above 12 counties: Robt. McGowan, chairman, Steubenville, Ohio; Theo. Wiles, Zanesville, Ohio; W. H. Penrose, Marietta, Ohio.

No. 4 or southern district, composed of the following counties: Meigs, Scioto, Ross, Hocking, Gallia, Pike, Vinton, Lawrence, Jackson, Athens. Committee of arbitration for the above 10 counties: F. M. Bovie, chairman, Gallipolis, Ohio; George Appel, Portsmouth, Ohio; ——— Vaughters, Chillicothe, Ohio.

No. 5 or southwestern district, composed of the following counties: Hamilton, Adams, Warren, Montgomery, Shelby, Clermont, Highland, Butler, Miami, Auglaize, Brown, Clinton, Preble, Darke, Mercer. Committee of arbitration for the above 15 counties: W. W. Andrews, chairman, Cincinnati, Ohio; O. C. Morrow, Hillsboro, Ohio; John K. McIntire, Dayton, Ohio.

No. 6 or central district, composed of the following counties: Franklin, Greene, Logan, Delaware, Knox, Fairfield, Pickaway, Clarke, Union, Marion, Licking, Fayette, Champaign, Madison, Morrow, Perry. Committee of arbitration for the above 16 counties: Fred Shedd, chairman, Columbus, Ohio; H. H. Eavey, Xenia, Ohio; C. C. Stoltz, Marion, Ohio.

Any complaints or violations on sugar or packaged coffee shall first be referred to a member of the local board of arbitration having charge of the division or district wherein the violation is alleged to have occurred.

By order of the board of directors.

ORRIN THACKER, *Secretary.*

[The Ohio Wholesale Grocers' Association Company, Columbus, Ohio, May 26, 1899.]

To all wholesale dealers in sugar.

GENTLEMEN: After a full and fair discussion of the whole subject of sugar equality at a meeting of the new board of directors of this association, held at the office of the secretary on the 18th, the following resolution was unanimously adopted:

[Copy.]

"Resolved, That we reinstate the equality plan for the sale of sugar in the entire State of Ohio on a basis that may be agreed upon."

Suggestions were then entertained by the board from jobbers located in different parts of the State, after which the following was unanimously adopted:

"Resolved, That the executive committee and the secretary publish a new rate book, in which the rates shall be graded gradually, beginning with a one-sixteenth basis in northern Ohio, and as the central part of the State is reached a one-eighth basis, and the southern portion full equality. The same to take effect May 29, 1899."

In accordance with the above order of the board of directors the new rate books have been prepared and the secretary has been instructed to send you to-day sufficient copies to supply each of your salesmen. The new rate books are to be used precisely as the old, viz: New York card plus the rate in the rate book opposite the town where sugar is sold, less local rate of freight, to be deducted from invoice.

The committee desires to say further that under present conditions it is impossible to get support from the refiners in regulating the cutter and rebater. Therefore, it is left to the honor and good sense of each jobber as to whether or not a profit on sugar shall be obtained in the future. You see to it that your men do right, and carry out the rules and prices to the letter. Confide in your competitor, and believe every man honest until he is proven dishonest. All do this and we will have no trouble.

The committee adopted a new rule for its guidance hereafter, viz:

"As soon as this office receives reliable information that sugar is being cut or rebated by any house or salesman at any given point, all jobbers who sell goods at the point where the cut has been made or rebate given will be notified at once to reduce the freight rate (naming the rate) to that particular point to an amount equal to the cut or rebate given." For example, the price of granulated to-day delivered in Elyria, Lorain County, according to the new rate book is 5.53. If any salesman should cut or rebate to a retailer in Elyria, say 20 cents per barrel, and your salesman sends you a report to this effect, examine the matter thoroughly yourself first, and if you are satisfied that a cut has been made, notify one of the members of your local board at once. The local board will then report the same to this office with recommendations, and if it is shown to the executive committee to a reasonable degree of certainty that a cut has been made the price will be fixed to all retailers in Elyria at 5.47, which, as you see, will make a reduction sufficient to meet the cut.

So it will be seen that every house will be on exactly the same basis. The dishonest, as well as the honest man, will, of course, take the loss.

The jobber should be very careful in making complaint. They should question the salesman who makes the change very carefully and be sure that it is well founded. You can see that if the complaint is acted upon by the committee it will mean a loss to every jobber selling sugar at that point.

Any complaints or violations on sugar or package coffee shall first be referred to a member of the local board of arbitration having charge of the division or district wherein the violation is alleged to have occurred. (See inclosed sheet for names of committee of arbitration of your district.)

It is now in your hands. Keep your salesmen straight and "don't jump at conclusions." Take all of them into your private office and explain the situation. They are interested most of all. Be sure you are right before making complaint to your local board of arbitration. If a report of a cut should reach your ears investigate it thoroughly first. *There will be nothing to lose and everything to gain by a little investigation.*

The plan to meet the rebater as outlined above has been in operation in the Chicago district for some time, and it has proven eminently satisfactory.

Very respectfully,

A. S. HAMMOND, *Chairman,*
J. E. WEIFFENBACH,
J. H. PADDOCK,

Executive Committee.

ORRIN THACKER, *Secretary.*

Q. Do you know how long a time this plan has been in existence?—A. I think only since May 26, or May 18, 1899.

Q. Not long enough to see what the effect is likely to be?—A. In Chicago they have had practically the same system.

Q. Have they had it for some time?—A. They have had it there for some time, and the Ohio plan follows that of Illinois, I believe, although I have never seen it so clearly stated.

Q. Do you know whether this Illinois plan has been successful in keeping the prices uniform?—A. It has not been entirely successful in keeping the prices at a profit; but whenever a cut of one-eighth was made the other grocers met it, and every single grocer would perhaps be glad to come back to one-eighth of a cent profit again; so on the whole it has helped to maintain a small profit on sugar.

THE DUTY ON SUGAR—IMPORTATIONS OF SUGAR.

Q. In your judgment the cost of refining sugar in Europe is considerably less than it is here. Does the present differential tariff in favor of refined sugar largely cover this difference in the cost of refining?—A. I believe it very nearly covers it. As to just what that differential is I am not able to say. It is a matter of record in the custom laws, you know, in countries that pay a countervailing duty.

Q. I said differential duty on refined sugar?—A. I do not think one-eighth covers the difference in the cost of refining between the United State and Europe.

Q. So as far as countervailing duties are concerned, that is, the duties that are put on imported sugars to offset bounties which are given directly or indirectly by European systems; you think that this countervailing duty is substantially accurate?—A. I think so; yes. It was left open for some months until they could determine it accurately, and I suppose the 28 or 38 cents on refined is as nearly accurate as they can determine.

Q. So that at the present time, so far as these European bounties are concerned, our refineries are certainly protected?—A. I think so.

Q. Now, as regards the cost of refining, this differential of one-eighth cent per pound does not quite cover the cost?—A. No; it does not cover the difference in this cost.

Q. Can you express an opinion as to how much would be required to cover it?—A. I think I did state a little earlier 15 to 20 cents a hundred. I think that is as near as one can tell without going into a very difficult calculation.

Q. You think, then, that it would not require 25 cents, or one-fourth of a cent a pound, in order to cover the difference?—A. I have an impression that the present protection to refineries, whatever that may be determined to be, is sufficient to enable us to compete with Europe.

Q. Are there any importations of foreign refined sugars at the present time?—A. Well, from January 1 to May 25 I see the report is 1,602 tons; in 1898 there were 12,243 tons, showing the decrease in the 2 years of 10,641 tons.

Q. What is the total amount consumed in tons?—A. In this country?

Q. Yes.—A. Two million tons, in round numbers.

Q. So that the importation of refined sugar here is merely nominal?—A. Yes.

Q. Has that condition of affairs with reference to importations been continuous for some years back, or have there been periods of a few years when large quantities of refined sugar were imported?—A. Whenever the prices maintained by the refineries here are high enough to warrant buying abroad, it comes over, but as soon as the margin is reduced it ceases to come.

Q. The reason, then, for the nonimportation at the present time is the very low margin between the raw and refined?—A. Yes.

Q. Would you tell us at about what margin between the raw and refined sugars we begin to receive importations of refined sugar; I mean as a matter of history?—A. No, I can not tell because it is very difficult to arrive at it accurately. It would depend upon the surplus stocks in Europe very largely. If there is a large surplus you will find that instead of lowering their prices they would probably ship it here, and if they only had enough for consumption on hand they would probably market it at home instead of shipping it here, so that it does not follow that the margin between the raw and refined would be the only reason that the refined would come here.

Q. Of course, that would not be the only reason, but, in your judgment, that would perhaps be the dominant influence?—A. I think that merchants and manufacturers of all kinds seek the market where they can net the most money without disturbing their own local markets.

Q. Could you give your opinion—it would have to be somewhat general—as to the normal margin between the raw and refined at which we might expect imports?—A. I should think that if the margin between raw and refined was three-fourths of a cent per pound refined sugars would come here.

Q. Seventy-five one hundredths expresses substantially the cost of getting sugar from Europe, added to the cost, with a moderate profit, of refining there?—A. Not altogether, because in order to maintain their prices in Europe they would ship their surplus refined here to be sold, even if they had to sell it at a little less than they did there at times.

COMBINATION AMONG THE SUGAR REFINERS A BENEFIT TO THE COUNTRY.

Q. From your experience in the sugar business for the last few years, do you consider that a combination of refiners, such as the American Sugar Refining Company, is to be considered on the whole a benefit or an evil?—A. I believe the results show that it has been a benefit to the country at large.

Q. And these benefits are shown?—A. In the reduced price at which the consumers are getting their refined sugar and in the more steady employment of labor. Of course, the reduction in the margin of profit increases the consumption, and we believe in that way it is very helpful.

Q. (By Senator MALLORY.) If I understand that question, you regard combinations such as the American Sugar Refining Company as the cause of all this reduction?—A. Well, personally, I think that the American Sugar Refining Company has not used the power that it might have used to maintain exorbitant profits. I think it has kept the margin of profit where it paid well for the money invested, but has not sought large profits over that.

Q. I did not quite understand your answer or the question. I understood it to be that in your opinion combinations such as the American Sugar Refining Company produce beneficial results in lowering prices and keeping up wages.—A. In the way that particular organization has been managed, I believe the result has been beneficial. I am not referring to the effect of trusts in general, but to that particular one.

Q. Has the competition to which the Sugar Refining Company has been subjected in the last two years had anything to do with the reduction in prices?—A. It possibly has; but I think, by the policy which has been pursued, that the American Sugar Refining Company has realized that it is important to keep the margin of profit fairly small, and there is no doubt that competition, and there has been all the time more or less competition, has had its effect too.

Q. In the event that the American Sugar Refining Company succeeded in suppressing all competition do you think that beneficial results would remain?—A. No, I do not; it would depend on who is the manager of it, but it is not natural. I think it would get a larger price if possible.

Q. Have you heard or not the statement of the manager here that they were in business for business and not for philanthropy?—A. (No audible response by the witness.)

Q. (By Mr. FARQUHAR.) When you made the statement in regard to the moderate prices charged by the American Sugar Refining Company does that cover the period between 1887 and the present time?—A. They have been in the organization since that time. It has varied in different years, of course, and things have come in to make the profit of the American in some cases larger than would seem natural, for example, in the purchase of raw sugar. They may be successful in buying raw sugars when the price is low, and they, having enormous capital, are enabled to carry it. There are certain seasons in the year when an advance in raw sugar would materially increase their profits. It would effect the consumer, but prices advance without their control or without their influence.

Q. Does the question of the tariff enter into the matter of the stock?—A. Yes.

Q. How?—A. Naturally, when the duty was taken off we carried just as little as possible. When the tariff was going on we probably put all our money into sugar, and all our credit, in order to carry as much as possible.

Q. The sugar business is conducted on the same business principles as the tobacco business, for instance?—A. Yes; I think it is. There are general principles that they follow.

Q. Is there any advantage in having the large capital that the American Sugar Refining Company has in buying stock and the raw material? Is it a rule in the business to carry extraordinary stocks at any time?—A. It is at times, because the cane crop of the world is marketed within a few months—January, February, March, and April—and at that time there is the greatest pressure always to sell, just as the greatest pressure to sell the beet crop would be in the fall. At those times they avail themselves of their immense capital to get as large a supply as possible at the lowest prices possible.

Q. Then the commission should understand from your former answer that it is the principle of the American Refining Company to control the market as much

as possible and to get control of the price at a moderate per cent of profit?—A. I think so; yes.

Q. Do you think that they have adopted that line of policy as a matter of safety against opposition or as a business method of getting an ordinary profit out of this large capital?—A. I do not doubt that the fear of competition influences them; it would anybody. They do not want to encourage other competition. The fact that the Arbuckle, the Doscher, and our refineries have been built since the trust was formed shows that capital is very willing to go into a business where there is a margin of profit, and there is considerable risk with it, too, of course.

COMPLETE CONTROL BY ONE ORGANIZATION WOULD NOT BE BENEFICIAL.

Q. Then, as another business proposition, suppose you are the head of a concern that is able to control 80 per cent of the whole output of the refined sugar of this country, would you regard it as a good business proposition on your own part for your board of directors to control by any possible means the other 20 per cent?—A. I should not think it was good business policy; no.

Q. Would you please give your reasons why perfect control is not good business policy?—A. Perfect control of any article of universal consumption is a very dangerous thing for any company or any body of men to have.

Q. (Interrupting). That is just what I want to get at—A. (Continuing). In my opinion we are all human, and we would naturally use the power it gave us. We would be restricted only by the fear of competition.

Q. When you say a dangerous power for them to have, you mean dangerous for the people in general?—A. Yes. They might not all be as broad-minded as Mr. Havemeyer in managing the concern; they might want to exact larger profits.

Q. You have noticed, I presume, in the public prints what he has said before this commission—that the profits have come from the consumer, and that it is their intention to control the market as widely as they can. Now, what I wish to know is what effect these independent refineries—there is, 15 to 20 per cent of refined sugar produced outside of the Havemeyer Company—have on the general market, on the consumer? What power through this limited attempt, you might say, have you to control prices?—A. We have not the power to control, but we have the power to influence prices.

Q. (By Mr. RATCHFORD). Do you think that power is in the interest of the consumer?—A. I think it is; it has been so.

TOO MUCH COMPETITION IS HARMFUL.

Q. If the independent refiners, producing 20 per cent of the sugar in this country, have a beneficial influence to the consumer, would not that beneficial influence be increased from the consumer's standpoint if the number of independent refineries was double or treble what it is to-day?—A. It might be temporarily, but it is a question how long some of them would last. Some of them would have to go out of business because it would be made unprofitable. While competition is necessary to a certain extent, it can be too great.

Q. What would cause them to go out, in your judgment?—A. Well, if there was more sugar made than could be used, we would naturally have to sell it for less.

Q. The operation of the law of supply and demand?—A. It might take 2 or 3 years to do it, and it might take 5 years. It would depend upon how much money each one had to start with.

RAW SUGAR INDUSTRY AT PRESENT IN A HEALTHY CONDITION.

Q. You said, I believe, earlier in your testimony, that the production of sugar was not increasing so rapidly as the demand?—A. I believe that is what the figures of the world show.

Q. Well, what have the American Sugar Refining Company, and other concerns of its kind engaged in that industry, to do with bringing about that condition?—A. In reducing the output?

Q. Either in extending the markets or curtailing the output?—A. The great reason for the curtailing of the output of the sugar in the world has been the war in Cuba and the Philippine Islands. Cuba, some years ago, as is well known, produced 1,000,000 tons of sugar per annum. Their output for the last 2 or 3 years has been 250,000 to 300,000 tons. It is very likely that in the next 5 years Cuba will be producing 1,000,000 tons of sugar. As soon as people feel that investments can be made there with safety there is money to go there to produce

sugar. It can be grown there more cheaply than in any other place in the world, in my opinion.

Q. Then, that situation would be present even in the absence of large combinations in that industry?—A. Yes.

Q. It is due, is it not, in other words, to natural causes?—A. I think it has been an unnatural cause, war.

Q. That being the case, then, the raw sugar industry is in a healthy condition?—A. Yes; I believe it is. I think it will be some time, probably 6 to 10 years, before the production of sugar in the world will be such as to reduce the price more than, possibly, half a cent a pound. I think the tendency will be, as Cuba increases her production, to reduce the price of raw sugar and in that way to reduce the price of refined sugar, and this country will be greatly benefited by the increase in production.

Q. If the sugar industry be in a healthy condition, then, wherein is the necessity, in your judgment, for the formation of trusts or combinations in order to regulate production and control prices?—A. They do not regulate the production except in so far as they have the power to make a great deal more refined sugar than can possibly be consumed.

Q. Did they not close down refineries?—A. Because they had capacity to make more sugar than the country could possibly consume.

Q. Does that not regulate production?—A. Is there any business that is not regulated by supply and demand whether in the form of combination or individual? I do not know of any.

Q. It is true all business is regulated by supply and demand; but in the absence of large corporations and trusts is it true that industries are closed down indefinitely, and in some instances dismantled, the business transferred from one community or one city to another? Is that true in any instances except under the operation of trusts or combinations?—A. It might not be transferred to other cities; they go out of business and fail.

Q. (By Mr. FARQUHAR.) Do you know of any United States refiners that have any interests in Cuban sugar lands?—A. Not as refiners.

Q. No, I mean companies, the American refiners, companies of any kind, have they any interest?—A. As individuals they have some interests. Some of our people own a plantation in Cuba, which has just recently been bought with a view of development. In fact, a cable came to us a few days ago offering a large estate that some of our people are going to manage. We believe that means good business under our Government.

Q. Now, do you know or have you any knowledge of Mr. Havemeyer going into that?—A. No doubt Mr. Havemeyer has investments in Cuba entirely independent of the American Sugar Refining Company, just as any other individual might own a great many other things. His money buys it.

THE PROFIT IN SUGAR REFINING.

Q. You spoke of an ordinary refinery costing a million and a quarter?—A. A million and a half, I think I said.

Q. A million and a half; and melting 1,000,000 pounds a day?—A. That is without the land, you mean?

Q. For a working capital of that refinery you perhaps need about two millions?—A. Yes.

Q. So that you take the whole capitalization, and it would be, say, four millions?—A. Yes.

Q. Now, out of your intimate knowledge of the whole sugar business, can you give this commission any idea how often a refinery of that kind could turn over its capital inside of 12 months?—A. They could probably do it from 4 to 6 times.

Q. Four to 6 times?—A. Yes.

Q. That comes from your 30 days' settlement, especially your short credits, does it not?—A. Yes.

Q. The immediate return of the capital to your hands?—A. Yes; and the discount is made so much to the grocers that it is an inducement to them to discount their bills, because 1 per cent in 7 days is equivalent to about 12 per cent per annum if they take 30 days' time, and therefore it is best for them, if they can, to borrow—as they do in our large centers—the money at 3, 4, and 5 per cent, according to their credit.

Q. Now, if you are not giving away any confidence here, would you be willing to state to this commission what per cent that capital would earn; I mean in good prosperous times; would it turn over 2 per cent net?—A. Two per cent 6 times would be 12 per cent a year.

Q. Yes.—A. It would be more than that.

Q. How much more have you an opinion it would be?—A. Well, if the refinery paid 20 per cent a year on its stock (not on the four millions, I do not mean, but as ours is capitalized at one million, although worth two millions) it would, on two millions, be equivalent to 10 per cent on the investment, which is certainly, in our opinion, little enough for the risk of the business in these times and for the ability it takes to manage it.

Q. Well, you could safely say that in good times it would probably go up from 10 to 12 or 20 per cent?—A. Which would vary probably. It would vary, not perhaps altogether according to the profit made in refining, but according to the fortunate purchases of raw sugar, possibly.

Q. (By Mr. JENKS.) You speak of the money that is made in the fortunate purchase of raw sugar and you have spoken of that quite frequently. You may happen to buy a large stock of raw sugar when it is low and then gain the benefit of the increase in price?—A. It is quite prominent in my mind just at present, because it has quite frequently been the case in some refineries.

Q. It is also quite frequent for the reverse process to take place?—A. Yes; a great deal of money has been lost in that way.

Q. You have spoken of one side, not of the reverse side?—A. It is possible; yes.

Q. From your experience in the business, I judge from what you say, the capital that is handled that way by the American refiners is more frequently handled to make a profit than a loss?—A. Well, there have been conditions in the last 6 years of changes in the tariff, war, and other conditions that have made it possible.

Q. (By Mr. PHILLIPS.) Can the refining industry be carried on without any tariff on sugar?—A. I think it would decrease very rapidly in this country and would be moved to Europe, to Cuba, and other countries if it was not protected.

Q. How much tariff do you think is necessary to maintain the industry in this country?—A. Well, the figure, as I saw it stated the other day, is one-eighth of a cent now. I think there is a little more than that protection in it; I think somewhere from 15 to 17 cents a hundred protection as against Europe. Under the great decrease in the production of cane sugars they have practically had the benefit (that is, Louisiana, the beet States, and the Hawaiian Islands) of this countervailing duty in the prices that they get for their products. Under conditions where we were using a very much larger per cent of cane sugar from Cuba, it would decrease somewhat.

CONDITIONS OF LABOR IN SUGAR REFINING.

Q. Are you informed in regard to the labor employed in the refining of sugar?—A. Only in a general way.

Q. And the conditions under which they work?—A. They work under very much more favorable conditions than they did from 5 to 7 years ago. They have very much more thought given to their comfort. I think an average of 3 to 5 cents an hour more money is paid to-day than some years ago. That would be a matter that could be determined, but my impression is that it is about that.

Q. (By Mr. RATCHFORD.) What wages do they get generally?—A. I think it averages now practically for the lowest paid labor from 15 to 18 cents an hour, and they have work—

Q. (By Mr. FARQUHAR.) How many hours a day do they work?—A. I think in most refineries they work on an average of 10 hours a day, but of course the length of the day varies. Sometimes they work 10 or 12 hours a day for a week and then they are thrown over to 8 hours, but I think they average about 10 hours a day.

Q. Ten hours a day. How constant is that employment?—A. Pretty steady.

Q. (By Mr. PHILLIPS.) Are the laborers subjected to a very great degree of heat?—A. There are a few men who are employed in the filter house, when perhaps for 2 or 3 hours a day it is necessary for them to be where the temperature is high; but from what I have seen those men are just as well pleased with that work—of course, it is only a short time—as where the men work in the cooler parts of the refinery. There are very few men required in that part of the refinery, of course, because the mechanical devices for handling charcoal are so perfect that very few men are needed.

Q. What class of labor or what nationality is employed chiefly in the sugar refineries?—A. I think they are very largely German, some Irish; I think hardly any Italians; there may be a few.

Q. (By Representative BELL.) You spoke of investment in Cuba by individuals engaged in the sugar business. Does that also extend to Hawaii?—A. The refinery that is located in California, I believe, has some interest in Hawaiian plantations Mr. Spreckles particularly.

Q. What effect do you think the supply that would come from Cuba would have

upon beet sugar production in this country?—A. Do you mean if the sugar of Cuba was admitted free?

Q. Yes; I suppose it is the idea of the investors that it will be admitted free.—A. Not necessarily, because it can be grown so very much more cheaply than cane and beet sugar can be in this country that therefore we would want to have sufficient tariff to enable the cane and beet to compete with the sugars from there.

Q. Why? Would that be from the cheap labor there?—A. No; from the natural conditions of Cuba; they say it is the ideal place to grow sugar.

CONDITIONS OF LABOR IN THE PRODUCTION OF RAW SUGAR.

Q. What is the labor problem there?—A. Of course, it is very unsettled, but with the moving in of people from this country it will be very much changed.

Q. You have no idea that the people in this country will ever go to Cuba to labor in the sugar refineries there?—A. I have an idea that the colored people of this country will find conditions so satisfactory that they will find a very acceptable and profitable employment there.

Q. Your idea is that if we Americanize Cuba it will be through the colored people?—A. Under the direction of men who will have to direct them in the growing of sugar.

Q. What is the average wages paid on a plantation in Cuba and Hawaii?—A. I think in Cuba it has been only 60 to 70 cents a day, but under the conditions that are ruling now and from the information I have received recently I think they are getting from \$1.25 to \$1.50 a day for labor in the field.

Q. And a man furnishes himself, does he?—A. They did; yes.

Q. On 60 to 70 cents?—A. They used to; that is, the food was paid for by themselves.

Q. About what part of the year do these refineries run; do they run constantly?—A. I think some of the refineries, of course, run constantly. Those that are the very best equipped are run constantly, except, perhaps, for three or four weeks in the year when they are cleaning up and repairing. The surplus refineries owned by the American Sugar Refining Company are only run during the season when the consumption warrants it.

A REARRANGEMENT OF THE TARIFF WOULD BE DETRIMENTAL TO THE SUGAR INDUSTRY.

Q. Now, it was said here the other day that the tariff was too low, and were it not for the tariff the refiners would have to go out of business. The same man who states that also states that the combination of sugar refineries never could have been built up but for the tariff. Is it your idea that a higher tariff than the present would cause an increase in the competition of refiners?—A. I do not think I am familiar enough with the conditions to express an opinion about that. I think there are enough refineries in the country to last for some years.

Q. What induces you to believe that the tariff ought to be increased? I think you said it ought to be increased to 15 or 20 cents.—A. I said that I believed that the protection under the present law is somewhere between 15 and 17 cents a hundred.

Q. You did not express an opinion as to whether it was high enough?—A. I did not express any opinion in regard to it.

Q. Have you an opinion on that subject?—A. Well, I have. I think that any rearrangement of the tariff would be more detrimental to the business than any increase that would be apt to go to the refiners. I think this continuous discussion of the tariff and continuous unsettling of business conditions by this talk about the tariff, taking the average of years, is a detriment to the country.

Q. The tariff has prevented the importation of refined sugar, together with competition, so far?—A. Yes; in a large measure.

Q. And you see no reason why it should be increased?—A. Not unless conditions in other parts of the world should make it necessary to increase it.

PRESENT CONDITION OF SUGAR BUSINESS THE RESULT OF SHARP COMPETITION.

Q. You have declared no dividends on your stock so far?—A. Not this year, no; we always have paid dividends up to this year.

Q. Are your conditions harder this year than they have been heretofore?—A. They certainly are; yes.

Q. That is caused by this very sharp competition?—A. It is; yes. I do not believe there is any refinery in the country that has made any money in the last 6 months, except possibly that losses have been reduced by having cheap raw sugars which they have been able to market at a little higher prices than were ruling some months ago.

Q. Do you have organized labor or unorganized?—A. I believe in one refinery it is organized labor; in the other I believe it is not.

Q. Is there any discrimination made between this organized and unorganized?—A. I think not.

Q. Do you know about what proportion of the refineries are running now?—A. I know in a general way that the outside refineries are making as little sugar as possible, and the American Sugar Refining Company is making a good deal of sugar.

Q. And the independents?—A. Are making as little as possible.

Q. Still because it is not profitable?—A. And probably 10 per cent of the country is being supplied by the outside refineries.

Q. You are willing the American Sugar Refining Company shall lose as much money as possible?—A. We are willing they should have all the business, so far as we are concerned, at present prices.

Q. Do you imagine they will destroy the independent refineries?—A. No; I think it will take 15 or 20 years at least, and that by that time they will adopt some other method. I think they will adopt some other method within the next 2 or 3 years, maybe the next 6 months. No one can tell.

Q. Is your organization a company or a mere firm?—A. A firm. B. H. Howell & Son is a firm, a partnership. The Mollenhauer is incorporated under the laws of New York, and the National is incorporated under the laws of New Jersey.

Q. You represent all those companies?—A. We do; yes.

Q. (By Mr. FARQUHAR.) Does the cheapening of refined sugar to the consumer result from competition entirely within the United States?—A. It does just at present; yes.

Q. At present?—A. Yes.

Q. And that competition could not be maintained without the presence of the independent refiners?—A. I think not.

RELATION OF THE SUGAR TRUST TO THE INDEPENDENT REFINERS.

Q. (By Mr. C. J. HARRIS.) From your knowledge of the sugar refining business, does the American Sugar Refining Company control directly or indirectly some of these outside companies that appear, to the general outside public, to be independent?—A. I know positively that they do not control these outside refineries.

Q. Not directly or indirectly?—A. Directly or indirectly. I am interested in 2 of them and I know who owns them. I know they do not control the Arbuckle and Doscher, the Nash & Spaulding in Boston, and the McCahan in Philadelphia, and they certainly do not control or own 2 or 3 in Louisiana and Texas, and they certainly do not own or control the beet producers, and they do not control the California Beet Sugar and Refining Company, which is owned by Hawaiian planters largely.

Q. (By Mr. PHILLIPS.) Is the American Company making any money at the present time, have you reason to believe?—A. My information is that they are not making money.

Q. Are they paying dividends?—A. They did declare a dividend a short time ago. Mr. Havemeyer has given a very good reason for that, I think, in his answer. It is very easy for a board of directors to declare a dividend; then the question of paying it, of course, is a business proposition.

Q. (By Mr. FARQUHAR.) One is an executive act and the other is a business proposition?

Q. (By Mr. PHILLIPS.) Do you mean to intimate that they declare it and it is not paid to the stockholders?—A. No; I believe they can declare a dividend out of their surplus and pay it; they certainly are able to pay it.

Q. Your judgment is that they pay it out of their surplus, and not out of their present earnings?—A. I think the dividend for the last 3 months will be paid out of their surplus.

Q. (By Mr. KENNEDY.) Do you know what their surplus is?—A. No; I do not. There are a good many thousands of people in this country that would like to know, especially those who operate in the stock. I do not know as they would like to know either, because then there would not be the uncertainty there is about it now, which is a great source of income to the stock manipulators.

THE BEET-SUGAR INDUSTRY IN THE UNITED STATES.

Q. (By Senator MALLORY.) Can you state the relation which the beet sugar manufactured in this country by the direct process bears to the total manufactured product in this country?—A. There has been a statement prepared here by Willett & Gray showing the beet crop estimated for this year, taking each State by itself, and it is about as nearly correct as anything I have seen. It shows that there are 11 States in which factories are operated. They expect the product for this year to be 122,000 tons of sugar.

Q. One hundred and twenty-two thousand tons. As compared with the production in this country of refined sugar, that is something less than one-twentieth, is it not?—A. Five per cent would be about 100,000 tons, and this is 125,000, say.

Q. This is what I am referring to. Is the beet sugar refined by the direct process?—A. It shows that Michigan is going to make 32,000 tons; California, 54,000 tons.

Q. Can you give any idea of the relative increase, in the last 2 or 3 years, of the product of that kind of sugar?—A. Last year it was only about 34,000 tons, partly in consequence of a drought in California; the year before it was about 41,000 tons.

Q. Has it increased very greatly this year?—A. Especially in Michigan and New York, where they have a State bounty, there is a very important increase.

Q. What would be the effect of sugar from Cuba in case we annex it—the effect of free sugar from Cuba? Would it be deleterious to that industry in this country?—A. I think in 5 years—it would commence to decrease immediately.

Q. As soon as sugar commenced to be imported freely?—A. I think it would decrease here in Louisiana, and in beets, because we can not compete with Cuba in growing sugar.

Q. Well, the sugar production of Louisiana is comparatively small in comparison with the consumption here?—A. It is about 220,000 tons, I believe.

Q. (By Mr. FARQUHAR.) Do you know whether there is any limit of these State bounties on sugar—beet sugar?—A. I think they are only paid from year to year. It takes legislation each year to pay it.

Q. Do you know as to the progress they are making?—A. Not exactly; no. As I understand it, Michigan is the one that is increasing most rapidly, and they pay it from year to year, as New York does.

Q. (By Representative BELL.) When was that report made up?—A. It was made up this year, quite recently.

Q. Does it credit anything to Colorado?—A. Yes; they expect to make 3,000 tons this year, using 30,000 tons of beets, with 3,000 tons of refined sugar output. In Utah it is 28,000; California, 54,000.

Q. (By Mr. C. J. HARRIS.) There is only about 100,000 tons that is expected to be made?—A. One hundred and twenty-two thousand.

Q. (By Mr. CONGER.) Do you know when Michigan first paid a bounty on the production of beet sugar?—A. I think it was 2 years ago.

Q. Do you know if the act of 2 years ago guaranteed a bounty for any length of time?—A. I think only for the current year, but there was a kind of an intimation made, as near as I can make out, that it would be continued for about 5 years.

Q. Do you not know that that act guaranteed a bounty for the period of 7 years?—A. I think it only guaranteed it for 1 year. That is my recollection; but, of course, that is a matter of record and can easily be ascertained.

Q. It is a fact that the act has been interpreted to guarantee the bounty for the period of 7 years. It can not be from year to year in Michigan, for the reason that the legislature meets biennially, and the appropriations have to be made at each session of the legislature; but the act itself contemplated the giving of the bounty to all factories that were put in operation for a period of 7 years from the passage of the act.

Q. (By Mr. KENNEDY.) Have you any business relations with the American Sugar Refining Company whatever?—A. Nothing in any way, except as any other commission merchants. We at times as commission merchants have raw sugars to sell, which we sell to them or anybody else that will buy them.

Q. You do not buy coopeage of them?—A. No; a separate coopeage company supplies both of our refineries.

Q. Some of the independents do?—A. The Doscher, I think, does. It is a separate organization that supplies whatever is required.

Q. Do you buy of anybody else?—A. No; of course there are other people who compete for our contracts. Our contract is with the Wideman Coopeage Company. The Arbuckle was with the Brooklyn Coopeage Company, but it is with

the Wideman Cooperage Company now, I believe. And there are other people who compete for it when the contracts are made. They have to be made for a series of years, because it takes quite a plant and quite an arrangement of staves and so on to supply it.

DISCUSSION OF THE MARGIN BETWEEN RAW AND REFINED SUGAR RESUMED.

Q. (By Mr. JENKS.) Is the margin of difference between the prices of raw and refined sugar substantially the same throughout the country, or has it been different in California and the West from what it was in the East?—A. It was larger in the West until quite recently, when the competition of beet sugar, the Hong Kong sugars, and the California beet sugar reduced it materially.

Q. I should like to revert again for a moment to the effect of the American Sugar Refining company upon prices, inasmuch as there has been handed to me, since you spoke on that matter, the quotations of raw and refined from 1879 up to date with the margin of difference. Perhaps you will yourself state what the result is in round numbers from 1884 to 1887, and then by yearly periods from that time on.—A. I will read from Willett & Gray's statistics the quotations for raw and refined for 20 years; only the difference, the average difference in each year, does not necessarily show the exact margin of profit, because the average is made up by itself, and the average for the cost of the refined might be very different, at least it might be one-eighth of a cent; the tendency would be to be one-eighth lower than the figures shown by Willett & Gray; the methods of selling are such in most years that the selling would show a little less.

Q. For a period of about 4 years before the sugar trust was organized the margin was substantially what?—A. 1884, it is quoted at .92; 1885, .71; 1886, .78; 1887, at .76 to .80.

Q. And then the sugar trust was organized in the latter part of 1887, and for the next 2 years?—A. In 1888, I see it is quoted at 1.258; 1889, 1.297; 1890, .72; 1891, .82.

Q. Those 2 years, 1890 and 1891, were two years that were explained?—A. Tariff changes.

Q. For one factor and the Philadelphia competition with the Spreckles refinery, if I recollect right?—A. The Spreckles and Brooklyn refineries, yes.

Q. Then for the next year?—A. 1892 was the highest figure—1892, 1.03; 1893, 1.15; 1894, .88; 1895, .88; 1896, .90; 1897, .92; 1898, .82. You can get the exact quotations up to this time, if you wish.

Q. Now, these figures seem to show that the average margin from 1887 is considerably higher than it was for 3 or 4 years preceding the formation of the trust, do they not?—A. Yes; I see the average for from 1888 to 1898, was .966. The average from 1885 to 1887 was apparently about .75.

Q. If we go back to the period 1879 to 1883, the average margin was about how much?—A. Well, for the 4 years, 1879, 1880, 1881, and 1882, it was about 1.40. I should think. In 1883 it was 1.08.

Q. Does it appear clearly from those figures, then, that the American Sugar Refining Company, or the effect of that organization has been, on the whole, to reduce or to increase the margin?—A. The effect has been to reduce the margin.

Q. Will you explain that, please?—A. As to why it was reduced?

Q. As to why there has been a reduction in the margin, if the figures as they appear here seem to show that the margin was higher on the average than for the 3 or 4 years preceding the formation of the combination, and that during the years when the margin has been less, there has been active competition, and during the years when the competition has been less active the margin has been considerably higher than it was during the 3 years preceding the organization?—A. That appears to be the reason—the competition: and I think the tariff changes had something to do with the average. There was one change in August; the duty was taken off and put on again; so that it would take a very lengthy calculation to tell that.

Q. But do not the figures seem to show that on the whole the effect, instead of lessening the margin, has been to increase it?—A. Within the last few years it might have.

Q. Beginning with 3 or 4 years before the combination?—A. During those 3 or 4 years of very keen competition, when several refineries failed and only the strongest were able to survive, the tendency was to drive out all the weak houses; it got to such a point that they were all very willing to try to come to an arrangement that would give them a fair profit.

Q. You would say, then, that the margin during the 4 years preceding the formation of the trust was smaller than the best interests of the country, as a

whole, really would demand?—A. I do think so, because if it had been kept up, it would have resulted in the reduction of the product; and then an increase would have come that it would have taken years to make up again. It would have driven out the weaker houses and prices would have ruled higher naturally, because the demand for sugar would be more than could be supplied by those who were the survivors.

Q. Then I think I see your reason for your statement that prices have been really lowered by the combination. You believe that, had the combination not been formed, the few survivors would have put the prices considerably higher than the combination has put them?—A. Because the demand for sugar would have been more than they could supply, and would have naturally enabled them to secure a greater price. When there is a great call for any article you can put the price up; when there is not, you have to lower it.

Q. That, I think, makes your point clear as to the decrease. The figures, so far as I could judge, seemed to be against the statement you have made here that the American Sugar Refining Company had reduced the prices, but the explanation you make is, that had the combination never been formed, the individual survivors, owing to the fact that their production would have been much lessened, would have been forced to put their prices considerably higher than the trust does. It makes, perhaps, your reason clear.—A. That explains it to me; that is why I think so.

Q. Your point was not quite clear to me; that is the reason why I wished to have this explanation made.—A. Yes.

Testimony closed.

THE WHISKY COMBINATIONS.

NOTE.—As early as 1870-71 many of the distillers north of the Ohio River entered into an agreement to limit their production in order to keep up prices.

November, 1881, the Western Export Association was formed to limit the output and to assess members in order to pay expenses of exporting the surplus stock, and thus to keep up prices.

From this time on there were frequent pools lasting for short times each until 1887, when, in order to secure a more stable combination, the Distillers and Cattle Feeders' Trust, formed on the model of the Standard Oil Trust, was organized with a capital of \$30,000,000 to be issued in trust certificates.

In 1890 this trust was reorganized as a corporation under the name of the Distilling and Cattle Feeding Company, with a capital stock of \$35,000,000. The new company had taken over from the trust 81 distilleries and cash and earnings to the amount of \$3,837,066, and there still remained in the treasury 34,084 shares as an asset. In the latter part of January, 1891, this treasury stock was issued. The Shufeldt and Calumet distilleries were bought, the stock being sold at 45.

In November, 1892, four other distilleries, making practically all of the important opponents, were bought. No bonds or stocks were issued to pay for these distilleries. Instead, the surplus was used and dividends lessened. In January, 1893, it was found that the cash on hand was exhausted and that no money remained to pay rebates, which had been promised to purchasers. The stock fell shortly from 65 and 70 to about 20. In May, 1893, the attorney-general of Illinois brought suit against the company on the ground that it was illegal. During 1893 \$2,500,000 bonds were issued and placed in escrow to secure rebates which had not been paid; \$1,000,000 worth of bonds was to be used as collateral in making loans for current expenses.

In December, 1894, the directors of the company suggested plans of reorganization; the treasurer suggested another. All of the plans involved a decided lessening of the stock. The suit in Illinois had gone against the company in the lower court and was before the supreme court. In January, 1895, notice was given that over a third of all the stockholders had organized a committee to protect their interest and secure a change of management.

January 28, 1895, holders of 1,700 shares applied for a receiver. The company, through the president, consented, and the president (Mr. Greenhut) and Mr. E. F. Lawrence were appointed temporary receivers. January 30 the stockholders' committee mentioned above secured from the court a stay and an order not to turn the property over to these receivers. February 2 Judge Grosscup removed Mr. Greenhut (he was said to be 15,000 shares short of the company's stock) and appointed Gen. John McNulta as the chief receiver, representing the court, and John J. Mitchell, president of the Illinois Trust and Savings Company, to represent the stockholders. Mr. Lawrence remained as a third receiver.

A committee was appointed to prepare plans of reorganization.

The plan finally submitted early in 1895 provided for \$1,500,000 first-mortgage 6 per cent 20-year gold bonds (out of a total issue of \$2,000,000); \$7,000,000 5 per cent noncumulative preferred stock and \$28,000,000 common stock.

The plan was in due time accepted, and the American Spirits Manufacturing Company was incorporated in New York, August 22, 1895. After considerable litigation between the receiver with the reorganization committee, and the former president and trustees, the best of the plants (16 distilleries) were taken over from the old organization.

In 1896 the case against the old Distilling and Cattle Feeding Company was finally decided in the supreme court of Illinois. The decision of the judge in the lower court was affirmed, the company being declared a trust and its charter annulled. Previous to the rendering of the decision, however, it had gone out of business, the most valuable property going into the hands of the American Spirits Manufacturing Company, as said heretofore.

The Standard Distilling and Distributing Company was incorporated under the laws of New Jersey to begin active business July 1, 1896. Capitalization, \$24,000,000—\$16,000,000 common stock and \$8,000,000 7 per cent cumulative preferred stock; there were no bonds. It was thought that this company would get control of most of the spirit-distilling plants outside of those in the American Spirits Manufacturing Company.

February 11, 1896, there had been incorporated in New Jersey, with a capital of \$7,350,000, the Spirits Distributing Company.

February 3, 1896, the Kentucky Distilleries and Warehouse Company, capital \$32,000,000, was incorporated in New Jersey.

The names of those interested in these companies suggested union; and in June, 1899, were published plans for the union of the four companies last named, together with certain rye-distilling properties, under the name of The Distilling Company of America, with a capital of \$125,000,000—\$55,000,000 7 per cent cumulative preferred stock, and \$70,000,000 common stock.

WASHINGTON, D. C., May 13, 1899.

TESTIMONY OF CHARLES C. CLARKE, PEORIA, ILL.

The commission met at 11 a. m. May 13, 1899, Vice-Chairman Phillips presiding. Mr. Charles C. Clarke, distiller, testified.

Q. (By Mr. JENKS.) Will you be kind enough to give your name and residence?—
A. Charles C. Clarke; Peoria, Ill'

Q. And your business at present is what?—A. Distilling alcoholic and cologne spirits and rye whisky.

Q. How long have you been engaged in the distilling business?—A. Since 1873; actively since 1882.

THE DISTILLING BUSINESS DESCRIBED.

Q. Will you explain to the commission, in the first place, something about the nature of the business itself, the relation between the distilling and the cattle-feeding business, the raw materials that you have to use, the side products that come from the business, etc.?—A. In the manufacture of alcohol and cologne spirits the principal products used are corn and malt. Of course there are other materials, in the shape of fuel, etc., that are not necessary in the manufacture except for the purpose of producing power. Corn is the basis of the whole production. Malt is used for its chemical effects in producing glucose out of the starch of corn. Fermentation is used in the process, which changes the glucose produced from starch into alcohol. After this fermentation takes place, the distilling process commences, by which the alcohol and spirits are evaporated from the fermented material and taken care of by condensation. The residue is the slop, which is used for feeding cattle. This is the connection that cattle have with the distilling business. Slop makes a very good feed and requires about 1 bushel of the original material to feed an animal.

Q. That is, from every bushel of corn that is used per day in the distillery you can feed one head of cattle?—A. One head of cattle; yes.

Q. What is the nature of the main product made in the Peoria distilleries that were connected with the Distilling and Cattle-feeding Trust?—A. Their products are principally alcohol, cologne spirits, gin, and many whiskies.

Q. What is the difference between their product and that of the Kentucky distilleries?—A. The products of the trust are the pure spirits that are capable of being marketed immediately after they are produced, whereas competitive products require age and time to perfect them. The alcohol and spirits are refined by running through charcoal, which takes out the essential oils and flavors, leaving nothing but pure spirits to a greater or lesser extent. Alcohol is not quite so pure as the pure spirits, having some flavor left; a little bit of essential oil, but not very much. The pure spirit is used for a great many purposes, such as the manufacture of colognes and essences; in the arts, wherever they need a very fine alcohol; and also in what we call the blending of cheaper grades of whiskies, 1 gallon of whisky being used to perhaps 5 or 10 gallons of pure spirits. The basis of a majority of the whiskies drunk in the United States is pure spirits, which is blended together with old rye whisky and bourbon, as the case may be.

THE FIRST COMBINATIONS OF DISTILLERS WERE POOLS.

Q. When were the first combinations made among the distillers in the line of business that you are engaged in?—A. The first combinations that I remember were in 1882. There was one combination in earlier days that I do not know much about; it was entered into in 1872; but the first combination that had any particular influence on the business was in 1882.

Q. What was the nature of that?—A. It was a pool—a pooling of the interests to regulate the amount that each distillery operator should sell.

Q. Tell us in detail with reference to this regulation of the amounts they put out.—A. At first each distillery agreed to produce so many barrels, the number being regulated by the committee of managers. They also regulated the prices, which were not arbitrary, but agreed on by all members. The pools were very successful at first, but were subject to a sudden breaking up, because it was not possible to control all the individuals that were concerned in them.

Q. About how many went into one of these pools?—A. We generally had 70 or 80 distilleries connected with them.

Q. How much was the product limited?—A. Sometimes to 40 per cent of the total capacity, sometimes to 50 per cent, but scarcely ever more than 50 per cent was operated.

Q. That is, if your capacity was 1,000 barrels a day, you would run 500?—A. Yes.

Q. Is there any loss in that?—A. Yes; there is more profit in running a distillery full time. It is at least half a cent a gallon cheaper running at full time than at half time.

EXPORTING AT A LOSS.

Q. What special purposes had your association in connection with export business?—A. We oftentimes found that we were overproducing. We organized our association into what we called the Western Export Association, for the purpose of exporting a surplus, which was done at a loss to the whole body, each distillery contributing so much to the loss sustained. At times we were assessed a high as 10 cents a barrel.

Q. Why did you export at a loss?—A. In order to prevent too great competition in this country by the overproduction.

Q. Could prices in the home market be so kept up?—A. Yes; they were so kept up.

HOW THE POOLS WERE BROKEN UP.

Q. You said these pools were frequently broken up. What broke them up?—A. Well, it generally came through one member producing more than he was entitled to; sometimes new distilleries being built created trouble; oftentimes they were broken up by limitation; we allowed them to expire for the purpose of getting them better organized. We could not reorganize them very well when they were in operation, but when they went to pieces and prices suffered to a great extent we often found it easier to get the distillers into the pools than when there was profit in the business. The minute a pool was broken, prices would decline and the business generally—in fact, I might say always—became unprofitable.

Q. Did you have any way of bringing pressure to bear on those who went into the pools to keep them from breaking the agreements—any penalty of any kind?—A. No; there were no penalties.

THE ORGANIZATION OF THE DISTILLERS AND CATTLE FEEDERS' TRUST.

Q. What was the next form of combination, after these pools, and when was that organized?—A. In 1887 the Distillers and Cattle Feeders' trust was organized. This was organized because we found our pools were getting unwieldy and it was hard to control the members. At times we found that they would agree to certain things, but would violate their agreements; and as the trust question had been studied, we thought we could make better profits and create a more stable business by organizing the different distilleries into a trust.

Q. Will you explain briefly the form of this trust organization?—A. A trust agreement was drawn up, which was a copy of the Standard Oil trust agreement to some extent, but changed to suit our business. There were nine trustees appointed, who, in the beginning, put their distilleries into the trust, made themselves trustees of this property, and put all these distilling companies which they had organized into corporations; they put the stock of the corporations into the hands of the trustees, dividing it pro rata among the different trustees, and appointing one manager from the distilling company that had formerly existed, who generally held a share. The nine trustees, after getting possession of the stock, elected the board of directors for each constituent company that had been put into the trust, and this board of directors consisted generally of the manager of the distillery, who was not a trustee, and part of the trustees. The board of directors received their instructions from the trustees, and the board of directors instructed the manager how to operate the distillery. The method of putting each distillery into the trust was by organizing it into a stock company and placing this stock in the hands of the trustees, who issued in lieu thereof what they called trust certificates, generally increasing the number of shares that were issued to a large extent.

TRUST CERTIFICATES ISSUED FOR FOUR TIMES THE VALUE OF THE ORIGINAL PLANTS.

Q. Can you not tell us definitely with reference to that? Just how much was the increase in certificates over the ordinary stock that the company had had before?—A. I think, on the average, it was generally about 4 shares for 1 of the valuation of the distillery; that is, if the distillery and the personal property that was put in was valued by the trustees at \$100,000, they would issue \$400,000

in trust certificates. There were cases where only 3 for 1 were issued, and others where, I suppose, there were more than 4. It was controlled by the estimate of the valuations.

Q. Who made these valuations?—A. A committee of the trustees valued each distillery, and their valuation was the basis upon which the trust certificates were issued. It was supposed that they made the valuation so that the multiple of trust certificates was the same in all cases, and if there was any variation it came in the valuation rather than in a change in the basis.

Q. What was the basis of this first valuation: was it the cost of reproducing the plant, or its earning power, or what?—A. As near as the trustees could estimate the cost of reproducing the plant, that was made the basis of the valuation. Sometimes they said they also used the earning power as a basis of valuation.

Q. That is, they would first take the cost of reproducing the plant; then, if the distillery happened to be situated in a not very favorable location, they would deduct something, and if the property was well located they would put on something?—A. That is the way I have been told they did it.

Q. Then, the amount of certificates issued was about four times the valuation as fixed?—A. As near as I can learn in different cases, that was the fact.

Q. That was true in your own case?—A. That was true in our own case.

Q. Was the valuation placed upon each of the different plants made public, or did each distiller simply know what was given him?—A. It was intended that the valuation should be kept absolutely quiet and should be known only to the trustees.

Q. After the combination had been made in this way and the distilleries were practically under the management of the trustees, you said that each separate company had its own board of directors, who elected a manager to conduct the work of the distillery. How was that manager paid?—A. He was paid a salary for managing the distillery, whether in operation or not, for 5 years; he was paid by the original distilling company, not by the trust itself.

Q. Then the board of directors was under the control of the board of trustees?—A. Yes; the board of directors of each distilling company was composed of a part of the trustees and the manager of the distillery.

MANY DISTILLERIES CLOSED BY THE TRUST.

Q. What proportion of these distilleries was shut up?—A. I should judge about 75 per cent of them.

Q. How many went into the trust?—A. Eighty-one went into the original trust, and I think they did not operate over 10 or 12, except for a short time. They were gradually closed and combined with the larger houses and the houses that were most conveniently situated for producing liquor cheap.

Q. But they paid the salaries of those managers whether the distillery ran or not?—A. They were paid right straight along for the first 5 years, whether operating or not.

Q. In the distribution of dividends on trust certificates, was any distinction made between the distilleries closed and those running?—A. Anybody who received trust certificates received a dividend as long as they were declared by the trust. They commenced paying dividends almost immediately after the trust was organized, and continued for several years.

TREATMENT OF COMPETITORS.

Q. What methods did the trust employ toward competitors?—A. They used every effort in the world to induce them to join the trust, by showing them the profits that were to be made both in the business and the probable increase in value of the certificates. All kinds of inducements were laid before those that did not join at first; a great many refused to come in for a good while; one or two did not come in at all.

Q. Were prices cut against those that were out?—A. There were very often cases where prices were cut on outside competitors, especially to the regular trade—trade that they considered their customers. The methods used were to send a salesman to any known customer of an outside distillery and offer him lower prices than the regular prices made by the trust. These were, of course, secret and not quoted prices. They induced some members to come in by cutting prices to their customers, causing them to fear that they were going to lose the trade. They then joined the trust on the same basis as the rest.

EFFECT OF THE TRUST ON PRICES AND PROFITS.

Q. What was the general effect on prices?—A. As soon as the trust was well organized there was an increase in the price of the product, the business having been conducted at or below cost before the trust was organized. In a short time they put prices up to where there was a very good profit.

Q. How much profit as compared with what it was before?—A. I think they put on a profit of about 5 cents a gallon shortly after the trust was organized; that is my remembrance of it; it may have been only 4 cents.

Q. Did that affect the sales particularly?—A. It was put on at the time of year when trade is generally lively; in fact, I might say that the trade increased each month at that time, but that was because of the usual demand that comes at that season of the year. It was well timed for a rise of prices.

Q. You spoke about the general increase in prices and the way in which goods were sold to the trade. What about special discounts to the distributing agents, the wholesale dealers, etc.?—A. After the organization of the trust there were not many special discounts, although to individual members of the trust who also owned a distributing house there were probably some special prices made, but it was kept quiet and was not generally known to the trade.

Q. That is, some of the managers of the trust sold the products to themselves in another capacity cheaper than to others?—A. It is supposed to have been so.

Q. How about the rebate system?—A. That was not inaugurated until after the trust expired.

Q. What was the rebate system?—A. That was organized by the successors of the trust.

ORGANIZATION OF THE DISTILLING AND CATTLE FEEDING COMPANY.

Q. Why did the trust go out of existence itself as a trust?—A. My remembrance is that the New York courts had declared the sugar trust an illegal combination; and in order to avoid the same thing in our State, we organized the corporation known as the Distilling and Cattle Feeding Company.

Q. Was this change of form entirely voluntary on the part of the trust?—A. It was done by a vote; almost all the parties holding trust certificates, as well as others, declared in favor of it.

Q. Can you give the dates of the organization of the trust and of this change in form?—A. The trust was organized in 1887, and the Distilling and Cattle Feeding Company succeeded it in 1890.

Q. Was there any change in officers, or in the management and methods of doing business, etc., when the trust went out of existence and the new company was formed?—A. The trustees at the time of the reorganization became directors in the new corporation. The managers of the different distilleries were appointed just the same as under the trust agreement; the salaries were continued and assumed by the new company, and afterwards paid by the new company.

Q. What was the relation of the separate distilleries, that had their own boards of directors, to the trust, and what was their relation to the new board of directors and to the new company?—A. They were bought; these corporations were abandoned; they surrendered their charters to the State in which they were organized and became a part of the new corporation. The board of directors ceased doing business, and thereafter the distilleries were controlled by the nine directors of the new company.

Q. Did they assign managers directly?—A. They appointed managers directly.

THE REBATE SYSTEM OF THE NEW COMPANY.

Q. Now, you said that under this new company, the Distilling and Cattle Feeding Company, a system of rebates was inaugurated. What was that?—A. There was a system of rebates organized by this new company by which they had two sets of customers. The original buyers from a distillery were given for themselves a rebate of 2 cents per gallon and extra rebate certificates of 5 cents per gallon to distribute to their customers. These were paid by the Distilling and Cattle Feeding Company, making a total rebate of 7 cents. The trust itself delivered the 2-cent rebate to the distributors and also the 5-cent rebate to be given by them to their customers.

Q. That is, to the wholesale dealers?—A. To the wholesale dealers. The wholesale dealers and also the distributors were obligated to buy all their goods of the trust, or rather of the Distillery and Cattle Feeding Company. That is to say,

the wholesale dealers were obliged, in order to get their rebates, to buy all their goods of distributors supplied by the Distillery and Cattle Feeding Company, and the distributors, in order to get rebates, were also obliged to buy all of their goods from the Distillery and Cattle Feeding Company.

GOVERNMENT RECORDS USED BY THE TRUST.

Q. By what means could they find out whether or not they were living up to these agreements before paying the rebates?—A. They retained the right to examine the Government books. Oftentimes they did not make any examination; but wherever there were charges of a violation of the rebate agreement, they refused to pay until they had a chance to examine the Government records of each customer.

Q. What records are kept by the Government that would show all of these facts?—A. There is a regular record kept under instructions from the Government by each wholesale dealer and jobber in the country; it is called Form 52, and keeps a record of every package of spirits in any form, whether whisky, gin, or any class of liquors produced by distillers. The number of gallons is shown, to whom it goes, and the serial number of the package. This makes an absolute record for the Government at all times by which it is possible to prevent fraud. All wholesale liquor dealers and rectifiers are obliged to keep this record accurately. It is often examined by the Government, and is a very accurate record. An examination of these records would show immediately from whom the distilling products had been bought, so that the trust could very easily tell whether the parties had abided by their agreement.

Q. Are these records kept by both the distributors and wholesale dealers?—A. Yes; they are.

Q. Are retail dealers compelled to keep any records?—A. No; but they are not allowed to sell over five gallons at a time.

Q. Who has the right under the law to examine these records?—A. The revenue officials of the United States.

Q. Then what right had the Distilling and Cattle Feeding Company to examine these records?—A. That was a part of the agreement concerning the rebate certificates.

Q. What was the effect of the rebate system upon the business as a whole, and upon the welfare of the company itself?—A. At first it seemed to be a very good thing for holding the trade. After the customers had once become attached to the trust they did not seem to be inclined to turn their custom elsewhere; at all times, however, there were some men who refused to buy of the trust and bought of outsiders. There were only two large distilleries that were operating outside the trust.

Q. What ones in particular?—A. The distillery of H. H. Shufeldt & Co., of Chicago, and, I believe, the Calumet Distillery, of Chicago, were operated outside of the trust.

Q. Were the rebate certificates promptly paid by the company?—A. Payment was very prompt after six months; that was the agreement; at the end of each month—that is, six months after the certificates were issued—they were redeemable at the trust office and were paid on presentation. There were very few of these certificates upon which payment was refused, and only then in the cases where violations had been flagrant. A minor violation did not attract much notice, but wherever it was large and the customer discontinued giving his trade to the trust payment was refused.

OUTSIDE DISTILLERIES BOUGHT UP WITH THE REBATE FUND.

Q. Did this prompt redemption of certificates keep up?—A. It kept up until along in 1893 or 1894, when the trust got into trouble, through the fact that it had to buy a great many competing distilleries, which absorbed all its ready cash. I believe they used the rebate fund for buying up the competitors who had come into existence in a few years. I think they bought the Shufeldt Distillery, the Calumet Distillery, the Crescent Distillery at Pekin, and a distillery in St. Louis, along in 1893 or 1894; but I can not remember the exact date.

Q. And they used the money that was really due at the time to holders of rebate certificates to make these purchases?—A. I understood they used the money that had been set aside for rebates for that purpose. They had kept the fund intact for a good many months, but at that time I believe they used it to buy these distilleries.

Q. What effect did that have on the distributors and wholesale dealers to whom money was due?—A. The distributors themselves did not seem to worry much about it, but the wholesale dealers and jobbers were very much alarmed, and, I believe, organized a committee to look after their interests. The trust itself—I will not call it the trust—the company itself seemed to think it would come out all right, and they issued bonds to protect the rebate holders. These bonds were a mortgage on the trust plants.

Q. What was done with the bonds? How did they protect them?—A. They were placed in the hands of a trust company in New York as a guarantee to secure payment on the rebates.

STOCK OF THE DISTILLING AND CATTLE FEEDING COMPANY.

Q. Was the stock of this Distilling and Cattle Feeding Company the same in amount as the trust certificates of the old trust?—A. I think it was exactly the same, except that a few shares more were put in the treasury. The original trust certificates were in the neighborhood of \$34,000,000, whereas the new company capitalized for \$35,000,000, the balance of the stock going into the treasury to be used for the future welfare of the company.

Q. What was the basis of a trust certificate itself?—A. It was based upon the stock of the original constituent companies.

Q. According to the statement you made before, as I understood, this original stock represented pretty fairly the value of the plant itself, and when the certificates were issued they were issued to something like four times that amount?—A. Yes.

Q. What was the form of the guarantee itself?—A. Simply a certificate of the stock of the corporation. The corporations were, all of them, at that time free from debt. Each corporation owned a distillery and the stock of that corporation was all turned over to the trustees.

Q. Was it put into their hands as trustees?—A. It was formally assigned to them as trustees and paid for by them with trust certificates, which were issued at the appointed amount of 4 to 1.

Q. (By Mr. FARQUHAR.) What was the dividend on unpaid stock to the parties who entered into this trust?—A. There was not any unpaid stock.

Q. There must have been unpaid stock, if 4 to 1 were issued.—A. It was a trust certificate that was issued in lieu of the stock of the corporation; for instance, if the corporation put in 1,000 shares of its stock at par value, \$100, they would receive 4,000 shares in trust certificates of a par value of \$100. They never pretended that this was a legal transfer.

Q. Did the trustees hold this amount of overcapitalization in the ratio of 4 to 1, or did it go to the credit of the original stockholders who were members of the first trusteeship?—A. The overcapitalization went to the owners of the stock of the constituent companies.

Q. Of the separate companies?—A. Yes.

Q. (By Mr. PHILLIPS.) They had no treasury stock, in other words?—A. No; there was no treasury stock at the time of the original trust.

Q. Was the real and personal property of the constituent companies turned over to the trustees, or was it simply a stock transfer?—A. Simply a stock transfer.

Q. Where was the ownership of the property, if not in the trusteeship?—A. The ownership of the property was in the original constituent company.

Q. So your trusteeship was simply conditional?—A. The trusteeship was simply conditional.

THE AUTHORITY OF THE TRUSTEES.

Q. What were the powers of a trustee over any concern? Were they limited in writing?—A. His powers were the same as if he were an actual owner of the stock of the corporation.

Q. (By Mr. JENKS.) Did he have the power of voting that stock?—A. He had the same power as any owner of stock in a corporation; it gave the trustees possession of all corporations through the election of the board of directors.

Q. (By Mr. FARQUHAR.) What authority had the trustees for issuing bonds if they had nothing but stock? Did they have authority to market stock through trust companies or otherwise?—A. Perhaps you have not followed me closely enough. After the Sugar Trust was declared illegal in New York a company was organized as a corporation covering all plants which were turned over to it. After they became a corporation they had the privilege of mortgaging all the plants.

Q. But the point I desire to get at is the character of the trustee. Was he simply a trustee in law to transfer stock without having authority to dispose of all stocks and securities and outlying securities, or was his obligation simply a bond of honor? Did his authority amount in law to a possessory right?—A. In fact, it gave him a possessory right; but we have never been able to discover quite what his legal powers were.

Q. Was not his authority simply that of a temporary agent?—A. That was what it was supposed to be; and in law it has been demonstrated by a great many decisions that it was not a legal organization.

Q. (By Mr. JENKS.) When the organization was in the old trust form did the trustees at any time sell or dispose of any of the plants?—A. Not any that I know of.

Q. They closed several of them?—A. They closed a great many of them. There was one which they did sell, limiting the right of manufacture to anything but alcohol and spirits.

Q. When they were simply holders in trust how could they sell the distillery?—A. They were given authority under the trust agreement to do as they saw fit with the property.

SPECULATIONS IN THE STOCK OF THE COMPANY.

Q. What was the value in the market of the stock of the new company which grew out of the old Distillers and Cattle Feeders Trust? What was the nature of the fluctuations in value of the stock, etc.?—A. It varied in value greatly. Right on the start in, before it was listed, the value was about 50 per share, and after it was listed it varied in the 40's for some time. From then on it fluctuated up and down and went as high as 70, and I understand as low as 8. There were very violent fluctuations, according to the way the business was being conducted, and the manipulation by the speculating members.

Q. Tell us about the speculating members. Who were they?—A. Well, I understood they were the directors and the certificate holders. The directors were the men who did most of the speculating, but thousands of men were connected with the whisky business and imbued with the ideas of speculation, and I should not be surprised if almost every wholesale liquor dealer in the United States and a great many retailers took flyers in the stock.

Q. Were there any reasons to believe that the directors of the company were speculating, not only with their own money, but with the money that belonged to the corporation itself?—A. I believe it was shown before the courts that the directors used some of the money of the corporation for protecting margins in speculation. The reorganization committee later made that accusation and summoned some of the members in court. It was never brought to a final issue, but was settled outside of the courts.

Q. That is, they were charged with using the funds in the treasury of the corporation for protecting margins on stock held in their names as individuals?—A. No; not as individuals. The stock was bought in the name of the treasurer of the corporation.

Q. As an individual?—A. I think as agent of the company, and the money that was used was put up to protect this stock.

Q. That is to say, the company was really speculating in its own stock?—A. That is what I have been told, and that was what was brought up in the courts at the time.

Q. Did that fact when it came out have any effect on the price of the stock in the market?—A. When that fact was brought out, the stock was very low, and I do not think there was much fluctuation.

Q. About how long did the company continue in business?—A. From 1890 to the spring of 1895.

REASONS WHY THE COMPANY BROKE UP.

Q. Will you explain the circumstances under which it went out of business?—A. The owners of the stock in New York became very much dissatisfied with the management and a great number of them combined for the purpose of an examination and sent a special bookkeeper to the offices in Peoria to examine the books. Some of the shareholders in Illinois applied to the court at the same time for a receivership.

Q. Will you tell us just what you know of the complaint that was made against the management?—A. The business was not managed for the benefit of the stock

holders; the directors used their positions for the purpose of manipulating the price of the stock; they also used money of the company for protecting margins on stock. There were many other charges which I can not remember now.

Q. Practically the charges were dishonesty against the members?—A. I will not say that.

Q. Unwise action, then?—A. The charge was practically mismanagement of the business.

A RECEIVER APPOINTED.

Q. What further can you tell with reference to the change in management?—A. The holders of some 1,700 shares of stock applied to the United States courts in Chicago for a receiver, making the charge that the company was insolvent. On that appeal a receiver was appointed, 2 receivers, in fact—Mr. J. B. Greenhut and Mr. E. F. Lawrence.

Q. What connection did these 2 men have with the company?—A. Mr. Greenhut was president of the company, and Mr. Lawrence, of the old distillery in Chicago, was not connected with the company at this time. I think he was not even a certificate holder. A few days after this appointment, and before he had qualified as receiver, the shareholders in New York accused Mr. Greenhut in court of being a speculator in the stock and brought proofs to that effect. The court removed Mr. Greenhut as receiver and appointed in his place Mr. John McNulta, of Illinois, to represent the court, and Mr. Mitchell, of the Illinois Loan and Trust Company of Chicago, to represent the eastern share owners, leaving Mr. Lawrence in his position. Soon after Mr. Lawrence and Mr. Mitchell resigned, leaving Mr. John McNulta sole receiver as representing the court.

MANAGEMENT OF THE BUSINESS BY THE RECEIVER.

He took charge of the business and operated it for a short time, pending the reorganization which was being effected by the New York shareholders, who had formed themselves into a reorganization committee. I think General McNulta operated enough of the distilleries to keep the trade going from February, 1895, to November or December of the same year, when he was succeeded by the reorganization, called the American Spirits Manufacturing Company.

Q. In whose interests did General McNulta manage the business? How did he turn over the property to this new company you speak of—the American Spirits Manufacturing Company? What was done with the rest of the property which they did not take?—A. On the reorganization of the business the shareholders of the old company came in and bought from General McNulta 17 of the best properties for a sum equal to about \$10,000,000, which was paid, I understand, in stock of the old company and not in cash. Afterwards General McNulta turned over 4 or 5 more of the old properties for a nominal consideration, by order of the court. The new company, in assuming control of the distillery properties, agreed with the court that they would pay all debts of the old corporation and all receivership expenses, which they have done, as I have been told by General McNulta within the last 3 days. He said that the old company's debts and the receivership expenses had all been paid by the new American Spirits Manufacturing Company.

Q. (By Representative OTJEN.) Including the rebates of the old company?—A. He paid all rebates that were declared legal, or that the court allowed. There were some cases in which, when the purchase agreement had been violated, he refused payment; and the court decided that he was warranted in so doing.

Q. You have told us that 81 distilleries went into the old trust, and that all the old trust property was turned over to the Distilling and Cattle Feeding Company; now you say that of this new property the American Spirits Manufacturing Company took 17 different plants and afterwards some 4 or 5 others. What became of the rest?—A. A great many of them have gone back to the original owners of the real estate. In the first arrangement the real estate was not sold, but was held intact by the original distillers and leased to the organization that composed the trust.

Q. They sold the distillery and leased the land?—A. That was the plan, in fact. After the distilleries had been wrecked General McNulta refused payment on a great many of these leases by order of the court.

Q. On what ground?—A. That it was unprofitable to the receivership. They reverted back to the owners of the real estate who went into the original company.

Q. (By Mr. PHILLIPS.) For what period were they leased?—A. Twenty-five years.

Q. (By Mr. JENKS.) In selling to the trust the distillers retained the land but sold the distilleries with the good will of the business. That is incidental, is it not?—A. Yes.

Q. Was not that counted as part of the consideration in the increased capitalization?—A. The good will was counted as part of the increase in the capitalization.

Q. (By C. J. HARRIS.) Did not the distillers agree not to go into the distilling business also?—A. Not under the original trust. They only bound us up to 5 years on a salary.

Q. (By Mr. JENKS.) Was any change made in that respect when the new corporation took the place of the trust?—A. I think not; under this organization no one was bound not to go into the business except as he was controlled by a salary.

Q. Where and by whom is the stock of the new American Spirits Manufacturing Company mainly held?—A. A syndicate of New York capitalists have apparently been in control of this stock from the time of the organization until the present.

NO PROFIT IN THE BUSINESS IN RECENT YEARS.

Q. How has the new company succeeded as compared with the old one?—A. Since the new company was organized there has been very little profit in the business. I think there was scarcely a time from 1895 to July, 1898, when there was any profit. After the organization they agreed to sell at a price that would be profitable. This continued for about 6 months; but the outside distilleries, that were being built all the time, came into such direct competition with them that they were unable to sustain a profitable market, and up to July, 1898, there had been no profit in the business.

CONTROL OF THE MARKET BY THE COMBINATIONS.

Q. To what extent did the old Distilling and Cattle Feeding Trust control the market—about what proportion of the output was in their hands?—A. I think it averaged at first about 95 per cent of the production of spirits and alcohol. It decreased a little, as near as I can remember; but I should judge it never got below 85 per cent while the trust was in existence. After the Distilling and Cattle Feeding Company was organized there were more distilleries built, and the percentage outside was greater.

Q. About what proportion?—A. At one time the Distilling and Cattle Feeding Company purchased about all the outside distilleries and came very nearly into complete control of the output. When they made those purchases I should judge they owned over 95 per cent of all the distilleries producing alcohol and spirits.

Q. About what proportion of the output does the American Spirits Manufacturing Company control directly, or what proportion has it controlled?—A. I do not think it has ever controlled more than 60 per cent.

Q. Do you think that is enough to enable them to hold prices up?—A. No; they were never in a position to hold prices up to any great extent after they were organized until July, 1898.

ANOTHER COMPANY ORGANIZED.

Q. What new circumstances came in then that gave them better control?—A. The outside distillers, which had been rebuilding for several years, were competing quite heavily in 1897 and the spring of 1898. In fact, they were absorbing most of the trade and were being operated either at no profit or at a loss. There was a new company organized in the spring of 1898 called the Distilling and Cattle Feeding Company, which absorbed very nearly all the outside companies.

Q. Did it take the same name as the old company—the Distilling and Cattle-Feeding Company?—A. No; it is called the Standard Distilling and Distributing Company.

Q. I think you applied the other name.—A. I may have used the wrong words there.

Q. It is the Standard Distilling and Distributing Company?—A. It is called the Standard Distilling and Distributing Company. It was organized by the same influences that control and manage the American Spirits Manufacturing Company. While the directors are different, they are at the present time beginning

to amalgamate; they have controlled and operated the business since that last organization in a very mutual way, in no way competing with each other.

Q. It was organized among those who had been former competitors of the trust, but apparently by the friends of the American Spirits Manufacturing Company itself in order to stop competition?—A. Yes; it was organized by the friends of the Spirits Manufacturing Company in order that the two companies might run in connection and stop disastrous competition.

METHOD OF ORGANIZATION OF THE NEW COMPANY.

Q. What was the method of the organization of this new company?—A. As nearly as I have been able to find out, and from my personal knowledge of offers that were made, each distillery was valued at about what it would cost, and a cash offer equal to that cost was made to the owners. In connection therewith they were to receive also an equal amount of preferred stock in the new company, and in addition to that an equal amount of common stock. That is to say, where they valued a distillery at \$100,000 actual cost the owners would receive \$100,000 in cash, \$100,000 in shares of preferred stock, and \$100,000 in shares of the common stock of the company. The parties that underwrote this new company received on the same basis. If they put in \$100,000 to pay for a distillery they received \$100,000 in shares of preferred stock and \$150,000 in shares of the common stock of the company.

Q. Then in the organization of this new company, if I understand it, the plan was substantially this: Each individual distiller would sell out to this new company for the cash value of his plant in cash, an equal amount in preferred stock, and an equal amount in common stock?—A. Yes.

Q. Was the common stock delivered to him at once?—A. The common stock was delivered generally in 1, 2, 3, 4, and 5 years.

Q. That is, he received 20 per cent the first year, 20 per cent the second year, and so on?—A. Yes; the rest being held in escrow until the time of delivery.

Q. What was the purpose of that?—A. The purpose was to keep an owner of said stock from entering the outside business again. One of the agreements was that if he went back into the distilling business he was not to receive his common stock.

Q. He was practically obliged not to go into the business again for 5 years?—A. Yes; not to go into the business again.

Q. According to this plan the New York capitalists who advanced the money received the same amount in preferred stock and one and one-half times that amount in common stock?—A. That was it.

Q. For their services in advancing the money?—A. Yes; that is what I have been told by parties very closely connected with the company when it was organized.

THE AMOUNT OF OVERCAPITALIZATION.

Q. Can you testify from your own knowledge as to what part of this was the true value?—A. Only that part which represented the bid for the distillery.

Q. But from your own knowledge you can say that this new company offered the distillers a bargain of that kind?—A. Yes; I am certain that offers came in that way, for one came to me directly for the distillery I am operating.

Q. (By Representative OTJEN.) Where did the money come from that these different distillers received?—A. It was underwritten by a syndicate of New York capitalists. The total amount underwritten was \$4,000,000.

Q. And what security did they receive on the property?—A. They received in payment for underwriting for every \$100 one share of preferred stock and one and a half shares of common stock. The promoters of the enterprise received for themselves for every \$100 one and a half shares of common stock. On the whole issue, then, of \$4,000,000 underwritten by the syndicate which was used for the purpose of buying the distilleries the distillers got \$4,000,000 in cash, \$4,000,000 in preferred stock, and \$4,000,000 in common stock; the underwriters got \$4,000,000 in preferred stock and \$6,000,000 in common stock, and the promoters of the enterprise got for their expense and trouble \$6,000,000 in common stock. There was therefore a total issue of \$8,000,000 in preferred stock and \$16,000,000 in common stock to cover \$4,000,000 in distilling property sold by the distillers.

RELATION OF THE NEW COMPANY TO THE AMERICAN SPIRITS MANUFACTURING COMPANY.

Q. (By Mr. JENKS.) What has been the relation of the new company since its organization to the American Spirits Manufacturing Company?—A. I understand that they have a running agreement by which the American Spirits Manufacturing Company produces about one-third, or rather one-half, as much as the Standard Distilling and Distributing Company.

Q. That is, the Standard is about twice as large as the American?—A. The Standard produces about twice as much as the American, and buys whatever the American does not have a demand for. The American Spirits Manufacturing Company has a demand, through one or two distributing houses, for a great portion of their product. The balance is taken and paid for by the Standard Distilling and Distributing Company.

Q. What proportion of the total product is under the control of these two companies?—A. At the present time they are manufacturing about 75 per cent of the total product of spirits and alcohol.

Q. Are there any new distilleries coming into competition with them?—A. There has been one large distillery completed since they were organized and two or three more are in process of construction.

EFFECT OF THE NEW ORGANIZATION ON PRICES AND COMPETITORS.

Q. What has been your own experience as regards the effect of this new organization upon prices and upon their competitors?—A. The new organization that went into effect in July, 1898, immediately established a scale of prices which were profitable and which continued profitable up to the 1st of May. During the last 2 years, since the large new distillery at Terre Haute went into operation, there has been a constant cutting in prices; but, up to the 1st of May, of this year, they had not fallen below the cost of production. Since then prices have been at a point where there are no profits in the business.

Q. Did the new combination cut prices at all, until recently, in different neighborhoods, in order to drive out special individual distillers?—A. Prices were first cut, to a great extent, in the Eastern market. The new Terre Haute distillery started in to market its products in New York, Baltimore, Boston, and other eastern markets, and the prices of the product were cut in those markets more than in any others in the United States. Whether the trust cut the prices or whether the new company cut them I am unable to say, but they followed very closely in each other's wake.

Q. They have cut down prices, then, until there is practically no profit in the business?—A. The profit at present is practically wiped out of existence on account of the competition that has arisen in the last 2 months.

Q. Is it your opinion, then, that the effect of all three of these combinations has very generally been to increase and maintain prices?—A. All the combinations have controlled prices to a great extent and made profits in the business.

Q. Profits for their competitors as well as for themselves?—A. For both parties for the time being.

EFFECT OF COMBINATIONS ON WHOLESALESALE AND RETAILERS.

Q. What was the effect of these companies upon the dealers, wholesale and retail, and upon consumers?—A. My observation has been that the wholesale dealers were at an advantage when the combinations were making money, because the combinations controlled the amount of the product to such an extent that the wholesale dealers were able to get larger profits on their sales. They did not come into such fierce competition with one another. The retail dealers are mostly saloon keepers, and my observation has been that they are fully as prosperous when the distilleries are on a profitable as when they are on an unprofitable basis. The margin of profit is so small, comparatively, that it does not seem to affect the retail dealer. An additional 2 or 3 cents on the price of a gallon means a large profit for the distiller, but is not observable in the retailers' purchases. It might amount to \$3 or \$4 a month to a very large retailer, but to a moderate-sized retailer 3 cents on each gallon would perhaps be only \$1.20 or \$1.80, so that it is not noticeable to the retailer.

EFFECT ON THE CONSUMER.

Q. How about the consumer?—A. The consumer, as far as I can see, is not affected.

Q. Then, if I understand——?—A. (Interrupting.) Whisky goes over the bar

at the same price whether or not the distillers are making money and whether or not the business is controlled by a trust.

Q. When the price of whisky goes up, then, so that the business becomes profitable to the distiller, he sells to the wholesaler at a higher price, and the wholesaler always adds the advance to what he asks of the retailer?—A. Always.

Q. But as the retailer asks the same price of the consumer as before, is he not the one who, as a matter of fact, pays the increase in price?—A. It would seem to come out of the retailer entirely.

Q. But you think the difference is so slight that he does not feel it much?—A. I do not think it is noticeable to the retailer.

THE PROFITS OF THE RETAILER.

Q. His profits are so big that he can not tell the difference?—A. A gallon of whisky sold over the bar will ordinarily produce to a retailer anywhere from \$10 to \$20, according to his custom; and a difference of 2 or 3 cents a gallon cuts no figure with him in such a large sale.

Q. How much does the retailer ordinarily pay for whisky that he can retail at from \$10 to \$20 a gallon?

Q. (By Representative LIVINGSTON.) Take some special brand of whisky and make it specific?—A. Whisky which the retailer pays \$1.50 a gallon for, and which is a very cheap grade, though not above quality of whisky, might produce \$8 a gallon at 10 cents a drink. It is sold to men who take large drinks, and will not run over \$8 to the gallon. On \$10 or \$12 whisky, the prices range from \$1.75 to \$2.25 a gallon, and on \$15 whisky from \$2.25 to \$3.

Q. Do you know what the old Commissary whisky is sold for per case, e. g., by Alexander, of New York?—A. By the case?

Q. By the case. Most of those people buy by the case and not by the barrel.—A. Most of them buy by the barrel.

Q. Not fine whiskies?—A. No, not fine whiskies; I am not talking about fine whiskies; I am talking about whiskies that pass over the bar.

Q. Rectified whiskies they buy by the barrel?—A. Very fine whisky costs them more money. I put up a case of whisky in my rye whisky business that goes to the trade at about \$4 a gallon.

Q. You sell it by the case?—A. By the case.

Q. How much?—A. Twelve dollars a case; a case contains about 8 gallons.

Q. That is about what Commissary whisky is sold for by Alexander. What does the retail man make on that?—A. Of that class of whisky the retail man sells about 120 drinks to the gallon, which, at 15 cents a drink, would produce \$18, but at 12½ cents, not quite so much. Very fine whiskies are sold in smaller drinks; that class of trade does not use such large quantities; my experience has been that the drinks run about 120 to the gallon.

COMPOUNDING OF WHISKIES.

Q. (By Mr. JENKS.) Is is not pure spirits rather than the higher grades of whisky which these combinations, of which we have been speaking, manufacture?—A. They manufacture cologne spirits and alcohol. Cologne spirits is the basis of common and rectified whisky; and spirits, while a highly refined product, is the basis of the cheaper grades of whisky.

Q. Can you tell us where the compounding is done and something about the profits of the men that compound whiskies?—A. The compounding is done at what we call the rectifying houses. They put the pure spirits into a tub where it is colored with brown sugar and other coloring material and flavored with high-priced old whiskies and sometimes with flavoring materials.

Q. (By Representative LIVINGSTON.) Is not the flavoring always done by whiskies?—A. I think it is generally so done to-day, old rye whisky being added, sometimes in large quantities and sometimes in smaller. I have in my possession receipts for different grades that run from 1 gallon up to 20 gallons per barrel, 1 gallon being the very lowest that is used for flavoring. But there are flavoring materials that are used which are harmless in themselves. Though it is claimed some of them are harmful, I know of none such being used. Not being a rectifier, I do not know much about the different substances that are used except rye whisky and pure spirits. I produce both of these in my two distilleries, and am well acquainted with that important part of the business.

Q. Can they make apple brandy, rye whisky, or anything else out of it?—A. Anything desired in the cheap grade of brandies is made by using cheap cologne spirits. Such goods go to the cheaper saloons, those outside the district where,

perhaps, we gentlemen would go to take a drink. I think we are all pretty sure in the best saloons to get a good grade of whiskies, brandies, gins, and such things, but in other saloons—

COST OF RECTIFIED WHISKY.

Q. (Interrupting.) What is the cost of a barrel of rectified whisky on that plan per gallon?—A. It would cost the wholesale dealer \$1.30 for the original gallon of pure spirits.

Q. How much would the coloring matter cost?—A. The cost of the other materials used would be very small, except the rye whisky. The coloring materials and flavoring extracts would cost about 5 cents per gallon. The cost of the rye whisky will have to be estimated according to the amount used. At the present time a good quality of rye whisky (i. e., well-aged whisky from 3 to 10 years of age) costs, in large quantities, \$2.25 a gallon. If 10 gallons, which is quite a large quantity, were used, that would be \$10 extra on 40 gallons, which would be 25 cents a gallon. This, added to the original cost of \$1.30, makes \$1.55, and the 5 cents extra for coloring materials and flavoring extracts makes \$1.60 for very ordinary whisky. There is another method of cheapening it, which consists in the reduction of the proof. It may be put up at 60 proof, which makes it cost 60 per cent of what I have figured, which would be 96 cents.

Q. Is not the bulk of it put up in that way?—A. The bulk of it is put up at about 85 or 90 proof, although there is a good deal of whisky made at 60 proof. But that is getting into the business of rectifiers, and I do not know much about it, except what I have learned from rectifiers, being closely connected with them.

Q. (By Mr. JENKS.) Then the average price of rectified whisky is about \$1.60 per gallon if compounded in the way you have indicated?—A. If it were at proof.

Q. But 40 per cent less if it were put out at 60 proof?—A. Yes. There is another grade of cheap whisky made from pure spirits and flavoring extracts, which is sold at what we call 6 cents over the price of spirits multiplied by the strength. For instance, if the strength is 90 and the price \$1.30, multiply \$1.30 by 90, and add 6 cents, and you have the price of cheap rectified whisky. That is the way it is sold to the jobbing trade direct; not to the retailer.

Q. The purpose in putting the question in reference to rectifying was to show who gets the profits when the price of whisky goes up. According to what you have said abundant profits go to the rectifiers. Now who, in the main, does the rectifying?—A. The parties we call distributors generally do most of the rectifying. They sell mostly to the larger wholesale dealers. Some wholesale dealers do their own rectifying and mixing, and deal directly with the saloon. Both of these parties are known to the Government as rectifiers and pay the special tax on rectifiers.

CHARACTER OF WHISKY USED IN THE DRUG TRADE.

Q. Is the liquor sold in drug stores ordinarily bought directly from the trade and sold in the same way, or is that rectified and improved by the druggist?—A. The majority of druggists buy a pretty fair quality of whisky, mostly what we call straight whisky. In the prohibition States, where the drug store is practically used as a saloon, they buy the very cheapest grade of whiskies that come to the trade. I am pretty well acquainted with the drug trade, because in my rye-whisky business I have catered to the drug trade, and I believe I sell more straight whisky to that trade than any other distiller in the United States. They are anxious, as a general thing, to get a pure, straight, good whisky. In prohibition States I have found that they do buy these cheaper grades of whiskies.

Q. Then, so far as the profits from compounding are concerned, an increase in price by the trust is still borne by the retail dealers?—A. It would seem so to me.

Q. And, so far as the rectifier is concerned, any profit that he makes—A. As a general thing he fixes his price according to the price he has to pay for spirits.

Q. If the general price is higher, he will not make any more or any less than he did before?—A. He is always very anxious to buy his spirits just as cheap as he possibly can, but I have noticed that he is more prosperous when the product is controlled by the combinations. He objects, though, seriously to any combination, and would rather buy of the outside distillers.

Q. Why?—A. Because he dislikes the idea of being controlled in his business. He wants to be placed in a position so that he can say, "I will give you so much for those goods," and not say, "I want so many goods." Besides, he dislikes very much the system of rebates. After 3 or 4 or 5 years' experience with the rebates of the Distilling and Cattle Feeding Company, the rectifiers are very much averse

to tying themselves up to any combination that is liable at any time to put on rebates. I have met a great many wholesale dealers in the last 2 years, and they have all told me that they would buy of me in preference to the trust at the same price. I have never met a single buyer who has said he would buy of the trust in preference to outside distillers.

REBATE SYSTEM OF THE PRESENT COMBINATION.

Q. Does the present combination have a rebate system the same as the former one?—A. They have to a certain extent.

Q. What are their rates?—A. Their rates at the present time are made only to the distributors. They charge them a specific price, on which they give them 1½ cents rebate at the end of 5 months.

Q. Provided they can say they have dealt with no one else?—A. Provided they trade with the trust houses, i. e., the American Spirits Manufacturing Company and the Standard Distilling and Distributing Company. They attempted also to put rebates on some of the wholesale dealers who were able to buy in carload lots, but the wholesale dealers objected so seriously that they were unable to force the system upon them, in fact, they tried it on one or two parties and made lower prices, but immediately the wholesale dealer turned to the outside distilleries to buy, and the result was they abandoned the idea of trying to put on a rebate to the wholesale dealers, although all the distributors of the trust houses are getting a rebate at the present time.

EFFECT OF COMBINATIONS ON THE ORIGINAL OWNERS.

Q. What was the effect of these combinations upon the original distillers who went into them? What about your own case, for example? Why did you go in, and why did you go out?—A. I went into the first trust because I was glamourised with the pictures that were painted of fancy profits, and also because of the intimations that, if I did not go in, the trust would get after my customers and make life a burden to me. There were many difficulties. I objected to losing my individuality very much. I was quite a young man at the time and did not like to go into a combination and lose control of my business, but after some time I agreed to do it. I regretted it from the day I went in, although I secured very good profits for a long time.

Q. Your profits for a while increased decidedly compared with what they had been before?—A. They did not increase compared with what we had been making in the pools; but they increased to more than what they were before the pools were organized. It wiped out our individuality entirely with the trade, and we became merely agents of the trust. They employed me in several different capacities after they stopped running our distillery, none of which were agreeable to me.

Q. What kind of work did you do?—A. I was employed as a salesman in certain districts in California, but more especially to induce some recalcitrant members of the old combinations to come into the trust. It did not take very long to convince them that they ought to do so.

Q. What methods did you employ to get them in?—A. The methods consisted in cutting prices to their especial customers who had been doing business with them for years.

Q. (By Representative LIVINGSTON.) Pretty good argument, was it not?—A. Yes, sir. We went to those customers and offered them spirits at prices which the other men did not want to meet. They were not the quoted prices but private prices made at the time. It took but 3 or 4 days to accomplish what we set out to do.

REAL PRICES NOT THE SAME AS QUOTED PRICES.

Q. (By Mr. JENKS.) Are the real prices of the product of the American Spirits Manufacturing Company the same now as their quoted prices, with the exception of the 1½ cent rebate?—A. The prices that were quoted in the fall of 1898 have not been changed, but the actual prices of the distillery products that we are now selling are some 3 or 4 cents below the quoted prices. It has come about gradually through the trust and the outsiders getting each other's trade.

Q. Then, the real price is the quoted price, less about 3½ cents and the rebate?—A. That will be about the price.

Q. The real price is, then, about 5 cents below the quoted price?—A. No; they sell at about 4 cents below.

Q. Counting the rebate in, too?—A. Yes.

Q. About 4 cents below is the real price. How long has that been true?—A. Well, it commenced a little right at the start. The quoted price was always about half a cent below the actual price.

Q. What do you mean by the beginning?—A. July, 1898. The price to the trade continued at about half a cent below the quoted price up to February 1. Since the new distillery in Terre Haute went into operation, there has been a gradual cutting of prices, secretly, to the trade, until at the present time the actual prices of spirits and alcohol are about 4 cents below the quoted prices.

Q. How was it under the preceding combinations—the Distilling and Cattle Feeding Company and the Distillers and Cattle Feeders' Trust? Counting out the rebates, were the quoted prices the same as the real, or was there a good deal of cutting?—A. During the time of the rebates the quoted price was 7 cents higher than the actual price charged by the outside dealers. Of course, the quoted price was the price the trust charged to their customers.

Q. Then they took off the rebate of 7 cents?—A. Oh, yes, the rebate certificates were redeemed afterwards, but the outside dealers always sold at 7 cents below the quoted price.

THE BONDED WAREHOUSE SYSTEM.

Q. (By Representative LIVINGSTON.) In what way does the United States Government befriend these dealers?—A. They are not benefited in any way that I can see, except so far as they are influenced by—

Q. (Interrupting.) I mean, what direct benefit, if any, does the United States Government give the distillers of whisky; and if any, how?—A. I think the greatest benefit is in compelling us to keep accurate records, so that we know more about our business than we would otherwise. The Government's action results in the small dealers keeping such close account of their daily productions that they know at all times just exactly what they are doing.

Q. That is an indirect benefit. Is there not a direct benefit? When whisky is put into a bonded warehouse, does not the Government bear the loss on account of evaporation and give you all the profits?—A. I think you state that question in a prejudiced way.

Q. Can you state it in a better way?

Q. (By Mr. FARQUHAR.) Explain that whole system.—A. The Government allows 8 years in which to pay the tax, and for 4 years of that they do not charge for the evaporation; they regauge the package at the end of 4 years and levy the tax on what they find in the barrel at that time.

Q. (By Representative LIVINGSTON.) What is the percentage of evaporation in that first 4 years?—A. It evaporates about 9 gallons per barrel of 48 gallons.

Q. About 9 gallons?—A. That would be about 20 per cent.

Q. When you take it out after another 4 years do you regauge it again?—A. We regauge it again.

Q. Who bears the loss then?—A. The distiller bears the loss after the first 4 years, and I want to state to the commission that that law has produced the most disastrous results to the distillers.

Q. When the 8 years have about expired and you have not sold it, can you not ship it abroad and keep it and then bring it back with certain privileges?—A. We can leave it abroad just as long as we want to, and age gives it value. We can then bring it back and keep it in a bonded warehouse, and we are allowed 8 years to pay the tax.

Q. That makes 11 years?—A. Eleven years.

Q. (By Mr. PHILLIPS.) About what does it evaporate in the second 4 years?—A. It evaporates less in the second 4 years than in the first 4 years.

Q. What per cent?—A. I am working on 7 years; 7 years is the oldest whisky I have in stock and I am losing in the neighborhood of 17 gallons.

Q. (By Representative LIVINGSTON.) That ripens the whisky, if I understand it?—A. That ripens the whisky.

Q. Granting that the Government pays for the loss by evaporation for the first 4 years and you for the next 4, how much is the value of the whisky increased in that time by ripening?—A. Since that law was passed our experience has been that it worked the other way.

Q. How do you mean?—A. That the ripe whisky has sold for less at the age of 8 years than they were able to get for it when it was 4 years old in previous times. The law caused an overproduction of the finer grades of whiskies and resulted in lots of 8-year-old whisky being sold for less money than 2 or 3 year old whiskies.

Q. Where did you sell any such whisky as that?—A. We sell it all over the United States.

Q. Among the Indians, or where? Do you mean to tell me that the man who drinks whisky in Washington or New York pays as much for green whisky 4 years old as for 8-year-old or ripe whisky?—A. You misunderstand me; I mean the wholesale dealers in the way they buy them. For instance, we will suppose that they buy at the original gauge 8-year-old whisky of the distillers at 55 cents. For 8-year-old whisky they will pay only 45 cents. The reason for that is that the wholesaler pays the tax on the extra evaporation between the fourth and eighth years. He pays the tax on something that he does not get to give to the trade, i. e., the Government receives taxes on nothing. The result is that the price of the old whisky in its original form is less than the new that has been produced, which is very disastrous to the whole trade.

Q. Who bears the expenses for the first four years that the whisky is in the bonded warehouse?—A. The distiller.

Q. Do you mean all the preliminaries, the help, the rent of the warehouse, etc.?—A. Yes.

Q. Why is it put in bonded warehouses? Why not put it in your own?—A. We do not have the tax to pay in the bonded warehouse. Then we really do put it in our own, for we own the bonded warehouses ourselves, and they are only called bonded because they are in charge of the Government.

Q. You pay all the running expenses?—A. We pay all the running expenses; but we do not carry even our own keys.

Q. (By Mr. JENKS.) Do you carry the insurance?—A. We carry the insurance and every expense connected with the business.

Q. (By Representative LIVINGSTON.) And then get less for it than before it is ripened?—A. That has been the experience so far.

Q. Do you not think that that will break up the bonded warehouse system?—A. We hope Congress will enact a law levying the tax on what is in the barrel when it leaves the bonded warehouse. The present method results in disaster to the men employed in the business, creates a hardship on the trade, and does not benefit the Government.

Q. (By Senator DANIEL.) No matter how old the whisky may be?—A. No.

Q. Do you mean it should be taxed at the time it is sold?—A. At the time it goes into the general avenues of trade. That is the only proper way to get a fine and unadulterated liquor on the market. It should be taken out in charge of the Government and the tax paid according to what is found in the barrel.

Q. (By Representative LIVINGSTON.) Is the proof of the whisky raised or lowered by storing it?—A. That depends upon the condition of the warehouse. If it is dry and warm, it will increase; if it is cold and damp, it will decrease.

Q. (By Senator DANIEL.) Decrease in what respect?—A. In proof and strength. We put it in originally at about 100, and 200 is pure alcohol. It will increase from 100 to 125 in 4 or 5 years where heat is employed.

Q. (By Representative LIVINGSTON.) Can you, then, put in water enough to reduce it to 100?—A. Yes, they allow us to do that.

Q. (By Mr. JENKS.) How does the bonded warehouse system affect the product handled by these combinations?—A. It only affects them generally for 5 or 6 months. They care nothing for the bonded period except for the temporary storage; for their product is immediately marketable.

Q. (By Representative LIVINGSTON.) Are you now speaking of the trust?—A. I am now speaking of the trust production and also of the distillery I operate.

Q. Did he not ask you as to the effect of these bonded warehouses upon the trust?

Q. (By Mr. JENKS.) I asked how it concerned the trust.—A. It gives them a chance to handle their liquor so that they do not have to pay the tax until the trade demands it, which is generally in the course of 2 or 3 days, but which has been about 2 or 3 months.

COMBINATION NOT ESSENTIAL TO ECONOMY IN PRODUCTION.

Q. Have any methods besides the cutting of prices in special localities been employed by the combination in order to induce other people to come in?—A. They employ every means they know to induce others to come in—competition, intimidation, throat-cutting prices. Oftentimes they try to purchase their plants.

Q. Do you know of any cases where they have bought out rivals at more than a fair price in order to get them out of the way?—A. They have almost always had to do that.

Q. Can the individual distiller with a good sized distillery manufacture as cheaply and get as much in the way of by-products, etc., as the combination?—A. After a certain point he can, but too small a distillery is operated with less

economy, both in production and in the cost of labor. A reasonable sized distillery can perhaps compete with them, because it can average better in prices.

Q. (By Mr. PHILLIPS.) What would you call a reasonable sized distillery?—A. A reasonable sized distillery would be one of 1,500 bushels. That would not produce quite as much liquor and the labor would cost a little more per gallon, but not very much.

Q. (By Mr. JENKS.) Can a single independent distillery of 5,000 bushels manufacture as cheaply and get as much out of the raw material as any distillery managed by the great combination?—A. I think that a 5,000-bushel distillery can be operated as cheaply as any, both in respect to production and labor.

Q. Does any saving result from combination, so far as the manufacturing process is concerned, provided a man has a distillery of 5,000 bushels?—A. The combination of different distilleries makes no saving to anybody except, of course, that they can stop running some plants and make more profit out of the others.

Q. That is to say, so far as they really control the output?—A. Yes, sir; the combined distillers themselves have no particular advantage. The independent distiller can, on an average, sell his goods at the same or a better price than the trust, because the trade is inclined to favor him. The combination can not produce any more liquor per bushel of corn than the independent distiller, nor can their labor be made any cheaper after a certain limit is reached. A distillery consuming from 3,000 to 5,000 bushels is the most favorable size so far as labor is concerned.

Q. Does a great combination among the distillers afford any advantages in the buying of raw materials, fuel, etc.?—A. There is no saving in the buying of fuel or grain. I can buy 1 or 2 cars of corn just as cheap as the combination can buy 100,000 bushels.

Q. Has the combination been able to secure any better rates in the transportation of their product than the independent distillers?—A. I am unable to answer that. I know they have received very good rates at times, but I am unable to say whether they received better than I did.

Q. (By Senator DANIEL.) What rates do they give them?—A. I should say the regular tariff.

Q. (By Representative LIVINGSTON.) What rates do you get?—A. At the present time the railroads are pretty stiff on their rates, and I do not believe there is any cutting. There has been cutting in rates, but, I believe, not since the 1st of last January. I should not want to say that I received any rebates; that is against the law.

Q. You would not want to say that you did not, either, would you?—A. Well, that would depend upon what court I was placed before.

Q. (By Mr. JENKS.) Then, as regards the sale of liquor, you are inclined to think that the independent distiller has an advantage over the trust?—A. I think he has at the present time.

TRUST HAS AN ADVANTAGE IN SELLING IN FOREIGN MARKETS.

Q. Is that true with regard to both domestic and foreign markets?—A. I think the trust has the advantage in foreign markets.

Q. Why?—A. For the reason that when foreigners do buy they buy in large lots, 5,000 barrels at a time, and the only distiller that is able to offer 5,000 barrels is the large combination. They are also enabled to reach the foreign markets by having agents in so many different countries, which they are able to pay, but which the independent distillers are unable to support. In that way the trust is able to work up and hold the foreign trade in China and Japan, for example, where they have had an agent. The foreign trade, though, does not secure any more profitable rates than we get in this country, but it has the effect of relieving them of the surplus.

WORK OF WITNESS WHEN IN THE COMBINATION.

Q. (By Mr. PHILLIPS.) You stated some time ago that you were employed in disagreeable work when connected with the combination, such as inducing other persons to come into it. In what other capacity were you employed that was not very agreeable during that time?—A. I did not say that the employment was disagreeable. The fact of being a mere clerk of the corporation was the disagreeable part. I was employed also as manager of the Kansas City distillery for a while for the purpose of bringing it up to the highest state of perfection. It had been operated at a disadvantage by the trust, and they wanted somebody who had a knowledge of the latest methods to bring it to the highest state of efficiency. They sent me there for 5 or 6 months to bring about that result or demonstrate that the locality was unfavorable.

Q. You have given us some reasons why you went into the combination, but you have not told us why you went out.—A. I simply sold out my stock certificates in the Distilling and Cattle Feeding Company because it became very speculative and the prices were such as to induce a sale. I also sold out about the time that my salary as manager expired. At its expiration they did not see fit to renew it, and I did not demand it. In that way I became disconnected with the trust.

Q. Did you get what would be called an unusual salary while working for the combination?—A. My brother and I owned a distillery that was connected with the trust, and we received jointly \$5,000 a year for managing a distillery that was not operating.

Q. (By Mr. JENKS.) Did you not have any work to do?—A. I had no work to do after the distillery was closed.

Q. It was a fair salary?—A. It was a fair salary for doing nothing, but it was not too large if the distillery had been in operation.

Q. (By Mr. PHILLIPS.) Will you say whether you think it more profitable to operate individually or as a part of the combination?—A. I went into another line of business shortly after, called the rye-whisky business, and leased one of the trust's old houses that they were not operating. Of course that business did not compete with them in any way, but it was not active enough to suit me, and later (1897) I went into the spirit and alcohol business again. I leased another distillery for that purpose, and did not build. I found one already built that suited me, and I am operating it outside of the trust at the present time. When the Standard Distilling and Distributing Company was organized they tried to buy it through me, but failing in that, they went directly to the owners and bought it right out from underneath my shoulders; so that when my lease expires, which it will in the course of 4 or 5 months, I will be thrown out of that distillery and shall either have to build or go out of the business.

Q. (By Mr. JENKS.) They will then be rid of another competitor?—A. I suppose their object was to get rid of me as a competitor, thinking, perhaps, that I would not rebuild.

Q. (By Mr. PHILLIPS.) Do I understand that you have now no connection with the combination or trust?—A. None whatever.

Q. You are operating at present independently?—A. I am operating independently, and have been for the last 2 years.

EFFECT OF THE COMBINATIONS UPON WAGES.

Q. (By Mr. JENKS.) What has been the effect of these combinations upon wage-earners in the distilling business? Have they employed as many, on the whole, as were employed before? Have they paid as good wages, etc.?—A. I do not think they employ quite as many in all the distilleries, although wages have not changed in the last 20 years. All the employees of these distilleries receive very good wages. Their work is not hard and is very agreeable; they all seem to be satisfied. I have never known of distillery employees being dissatisfied with their salary or wages. They seem to enjoy the life, and did not object when the trust was organized. The trust increased wages in some of the minor positions and made them uniform in all the different distilleries. I believe they also at that time increased prices to the coal operators.

Q. So Mr. Greenhut testified. What was the effect? Was there permanent improvement?—A. Not with the coal operators or barrel makers. At first, when the trust was having a profitable business, they kept up prices to these different people, both the barrel makers and coal dealers receiving a fair profit; but when they began to have competition they brought everybody down to the closest possible margin, and coal at the present time is cheaper than ever before in the history of the distilling business. We are buying it every day at from \$1 to \$1.10 per ton in the bins of the distillery.

Q. (By Mr. RATCHFORD.) What kind of coal is that?—A. Common coal.

Q. Lump coal?—A. Bituminous coal. Unscreened, it is sold at \$1 a ton; screened, it is sold at \$1.15 per ton.

Q. (By Mr. PHILLIPS.) How many laborers are employed in a distillery running from 3,000 to 5,000 bushels per day, and what would their average wages be?—A. A distillery of that capacity requires from 40 to 60 men, perhaps 80, including the cattle feeders. The manufacture of spirits and alcohol does not require a very large quantity of labor.

Q. About what is the average wage?—A. The lowest wage is about \$11 per week; from that it runs up to \$30 per week for the more experienced men; the average would be perhaps \$18.

COMBINATION NECESSARY IN THE DISTILLING BUSINESS.

Q. (By Mr. JENKS.) From your experience, do you think the present combination is likely to succeed permanently, two former ones having failed?—A. I think competition will, in the end, bring about the downfall of all trusts. Still, I do not think our business can succeed for many years without some form of combination. We seem to be unable to get profits in the business without some form of combination. In fact, we almost always have to sustain losses when there is not a combination. I believe, however as I said before, that no form of trust can be perpetuated. There will be mishaps in the distilling business the same as in any other. I do not believe that legislation will be as effective in bringing the relief that people want as the natural course of events. I do not believe the people are so much oppressed by the trust's manipulation of prices as by the speculation in stocks and the disastrous results that follow to the original proprietors, who cease to be a part and parcel of the business world.

SPECULATION AND OVERCAPITALIZATION THE GREATEST EVILS OF THE TRUST SYSTEM.

Q. Then you think that this social fact and the speculation in stocks coming from overcapitalization are the two greatest evils in the trust system?—A. It seems so to me. I do not believe the evil results to the public are as great as pictured by people generally. I have never been able to see that any trust with which I have been connected has been oppressive to the people, and I have not observed that the prices established by other trusts have been at all hurtful to the public at large. As individuals, we buy as much as we are able; and when we find the price of an article is too high we curtail our wants to correspond with the capacity of our purses.

Q. Does not that hurt us any?—A. It results in no injury to us; it averages up so that, in the long run, benefits accrue to individuals. There is no form of trust that makes money but that also produces good results to the individuals connected with it. Immediately the distribution of their surplus wealth brings good results in other places, which perhaps counteracts the evils of the trust. That is my idea of the question.

RELATION OF COMBINATIONS TO THE DISTRIBUTION OF WEALTH.

Q. (By Mr. PHILLIPS.) Do you believe that an accumulation of \$100,000,000 in the hands of a corporation or an individual can really accomplish in any benevolent work or work for the people at large as much good as it would if left in its natural channels?—A. I think the chances are that one hundred millions could not be produced without the business methods of the combination, or, if it were, that it would be distributed so gradually that you would never notice the benefit of it.

Q. But if it were distributed so that we could not take note of it, would not that be more beneficial than the devoting of large sums to benevolent work?—A. I will not dispute the position that large fortunes are undesirable, but I believe they have never been accumulated in a way that is not beneficial to the people at large. I do not believe there are any disastrous effects to the public except so far as public feeling is turned against the man with a large fortune, resulting in socialistic and anarchistic sentiments.

Q. Would not general individual fortunes be much greater if it were not for the vast accumulations of recent years?—A. I believe these large accumulations have been a great benefit to the industry of the country, because they have made possible commercial enterprises and produced results that no single individual or small company could ever hope to attain. For instance, the Standard Oil Trust has solved the problem of pumping oil from Pennsylvania to Chicago; no single individual could ever have accomplished that with the small sums ordinarily invested in the oil business.

Q. Could not that have been done by an ordinary corporation just as well as by the trust? Is not the building of a pipe line much less expensive than a railroad?—A. Of course, that might have come about; but at the same time I have noticed, especially in our own case, that trusts are always employing men to experiment in new directions, both in working up trade and in lessening the cost of production. They have developed trade in foreign countries where there was none before; they have taken up and investigated new patents and made every possible effort to increase the volume of business.

Q. (By Mr. JENKS.) Can you point out any specific improvements in the distilling business which the combinations have made and which would not have

been made just as soon by private individuals?—A. There are quite a number of little things.

Q. Mention some special ones.—A. One concerns the amount of production. They have always employed a chemist, who has pointed out the mistakes of the yeast makers, and thereby enabled them to secure a higher average production per bushel of corn than was secured by individuals before the trusts came into existence.

Q. (By Mr. PHILLIPS.) Is it not a fact, however, that almost all the patents controlled by trusts and monopolies are the work of individuals, and that they do not originate with the monopolies?—A. I think that is true.

Q. (By Mr. JENKS.) Then, you are inclined to think after all, that if there is sharp competition among individuals new patents will probably be taken out that will ultimately become useful?—A. I think greater benefits are derived from patents when they go into the hands of large corporations, because the ordinary individual is generally unable to demonstrate to the world that his patent is worth anything. Put into the hands of a company, its utility is soon demonstrated. They push it and advertise it and get it to the trade, making people believe it is worth something, whether it is or not.

Q. (By Mr. PHILLIPS.) Do you believe that any individual, by his own efforts, unaided by discriminating laws, is capable of earning a hundred million dollars in 10 or 15 years?—A. I do not believe so. I believe such large accumulations are derived, not through the ordinary operations of business, but rather through the multiplication of stock certificates. A fair dividend on the stock gives value to it, but as a matter of fact a hundred million dollars has not been produced. A man may apparently be worth a hundred millions, while his real property is not more than a tenth of that. In fact, this was true of the original Standard Oil Company.

Q. But are there not well-authenticated instances of individuals dying in this country who were worth \$100,000,000? Why should one man be able to acquire so much more than another, having equal intellect and advantage?—A. It is not the difference in ability; but I do not believe you can get up any form of legislation that will stop such things under our present conditions.

LEGISLATION WILL NOT CORRECT THE EVILS OF TRUSTS.

Q. (By Mr. JENKS.) You have taken the position that stock-speculation, stock-watering, etc., are, perhaps, the greatest evils resulting from combinations. Have you any remedy to suggest?—A. Practically, I think these evils correct themselves and that legislation never eliminates them. Whatever laws you may enact to correct these evils and to regulate trusts, they will find ways of evading more rapidly than you can follow up with legislation.

Q. (By Mr. PHILLIPS.) But do not trusts levy tribute on the people? Do not some of the trusts exercise a more absolute power in fixing the prices of commodities than any king or emperor could?—A. I believe they do at times; but the minute they attempt to secure an arbitrary profit, you will find other investors going into the business, and then the evil is corrected more quickly than you could legislate it away. That is my idea on the subject; you may take it for what you think it worth.

TWENTY-FOUR PER CENT DIVIDENDS.

Q. (By Mr. JENKS.) Were there any dividends paid on either the certificates of the Distillers' and Cattle Feeders' Trust or on the stock of the Distilling and Cattle Feeding Company which you say was watered at the rate of about 4 to 1?—A. We received 6 per cent dividends for about all the time I was interested in either the trust certificates or in the stock of the Distilling and Cattle Feeding Company. The dividends were issued on the par value of the stock.

Q. As a matter of fact, then, the actual profits were about 24 per cent?—A. Yes, on the original cost of the plants.

Q. Did that continue until the concern went into the hands of a receiver?—A. Until very nearly that time.

Q. (By Mr. A. L. HARRIS.) Upon what basis is stock usually watered? For example, what was the basis in your combination?—A. Well, they issued four shares of stock for each share of the original cost of the property and the cash put in.

TRUST FIXED THE SELLING PRICE FOR DISTRIBUTERS.

Q. In speaking about the rebate system a little while ago you said that the distributor was required not to buy of any other distillery. Was it also made a condition that he should not sell below a certain price?—A. Do you mean the distributor?

Q. Yes; I mean the distributor.—A. I am not certain as to that point. At the present time the distributor is obliged to sell at a specific price. That is the present situation, but not the condition that existed years ago.

Q. (By Mr. JENKS.) Does the present American Spirits Manufacturing Company fix the price for the distributor and insist upon his living up to it?—A. Well, I think they fix the price, but the distributors have an association among themselves, known as the Distributors' Association, through which they agree to sustain certain prices that are regulated among themselves, although they may be dictated by the officers of the trust.

Q. (By Mr. A. L. HARRIS.) Do you remember the facts relied upon in the case of *Greene v. The United States*, in the habeas corpus proceedings, southern district of Ohio, several years ago?—A. I do not remember that at all. Was it connected with our company?

Q. It was connected with the Distilling and Cattle Feeding Company, but perhaps it was before you were in it?—A. I have known Mr. Greene all my life, but I do not remember that case.

Q. Do you remember that he was indicted along with others in Massachusetts?—A. Yes; I remember that.

Q. He was in Cincinnati and was arrested there, and when a requisition was made upon the Governor of Ohio for delivering him to the Massachusetts officers, he applied for a writ of habeas corpus. Was not the fact stated in the indictment that the distilling company had required the distributor not to sell below a certain price?—A. Yes; I remember the case to a certain extent, but my remembrance is not clear enough for me to give any definite idea on the question. My remembrance is that it was in the nature of a blackmailing case. I can not tell much about it at the present time; we had so many cases of that kind that my memory is not definite in regard to it.

ORGANIZATION OF THE UNITED STATES SPIRITS COMPANY.

Q. (By Mr. JENKS.) What do you know about the United States Spirits Company that was said to have been organized in Cincinnati about the middle of 1898 to distribute the country's output of alcohol and spirits?—A. I know of that in a general way.

Q. Can you not give some details with reference to that business?—A. I have a mere idea in regard to it; I had a copy of their proceedings, showing the prices to the wholesale trade and the prices to be charged to the retail trade. It came to me indirectly through one of the individual members. I got it as a matter of information so that I would know how to arrange my own prices.

Q. Do you know whether they have control, as distributors, of a very large part of the country's product at present?—A. They only control it so far as the trust gives it to them. The trust places all its product in the hands of distributors, but there are two distributing houses that belong to the trust, so that it is a distributor in competition with these local distributors who do not hold any stock in the trust. H. H. Shufelt & Co.'s plant belongs to the Standard Distributing Company, but the distributing house itself belongs to the American Spirits Manufacturing Company. In New York there is a large distributing house known as the American Distributing Company, which is owned by the Standard Distributing and Distilling Company. They own 2 or 3 more distributing houses in New York, one of which, I believe, is known as the National. They also have a distributing house in Cincinnati known as the Mill Creek Distilling Company. All of these are owned by the trust, which goes into competition with regular distributors; but, at the same time, they all belong to the association of which you were speaking—the United States Spirits Company.

COMBINATION OF RYE AND KENTUCKY WHISKY DISTILLERS.

Q. Do you know anything of the combination among the distillers or rye whisky and Kentucky whisky for the purpose of controlling all of their product?—A. I have been informed by many Kentucky distillers that they had been given options on their plants by the Kentucky Distillers and Warehouse Association. I know of one or two transactions being completed and the money paid, and I have read that quite a number of others were consummated also.

Q. Being in the rye-whisky business yourself, have you received any such proposition?—A. In no way whatever. I have had some conversation with the attorneys who were connected with the promotion of this combination, but have received no offers, nor any indication that there would be any offers.

THE CONTROL OF PRICES.

Q. (By Mr. A. L. HARRIS.) If a trust is able to control 80 per cent of the consumptive demand for any article or necessary of life, is it in a position to control prices?—A. A trust can control prices on an 80 per cent basis, provided they allow their competitors to get what trade they want and simply take what is left. In our line of business the competitors always seem to have the first choice, our product being a staple article. Of course, in staple articles a man can compete more easily with a trust than in articles which, you might say, are specialties. Any man who makes alcohol can sell it. But when he comes to offer rye whisky, his special brand may have a particular quality that makes a difference in the trade, and for that reason the trust might own 80 per cent of the rye-whisky plants and might, having the best brands, control 99 per cent of the trade.

QUESTION OF WAGES RESUMED.

Q. (By Mr. KENNEDY.) Do the wage-earners in your business have steady employment the year round?—A. For the last 20 years there has been pretty steady employment; it is very seldom that the distillers close down, and when they do the men are employed in making repairs.

Q. Are there ever very many who follow the business out of employment?—A. Very seldom; there have been a few men who have lost their places through radical changes who have been unable to get back, and who have had to seek other kinds of employment.

Q. Are they organized in any instance?—A. Only the engineers; there is no other organization of which I know.

Q. Have you stated the proportion of the distilleries of the United States that are now in the combinations, and the proportion that are outside?—A. In the manufacture of alcohol and spirits, about 75 per cent of the production is by the combinations and about 25 per cent by the outside distillers. This is not the proportion as to capacity, but the proportion of the amount that is being produced at the present time. For instance, there are about 30,000 bushels being manufactured into spirits and alcohol by the trust, and about 10,000 bushels by those outside of the trust.

PRESENT INDUSTRIAL CONDITIONS LIKELY TO CONTINUE.

Q. Do you believe that the evolution now going on in the industrial world will, if unchecked, eventually result in placing the industries of this country in the control of a few thousand men?—A. I do not think so. I believe that the present conditions in trade will continue. New men will be coming into the different lines at all times in such a way as to produce new competition and create practically the same state of affairs that we have now.

Q. (By Mr. PHILLIPS.) On a larger scale, do you think?—A. I do not think we shall have combinations on a larger scale; but there will be competition on a larger scale.

Q. (By Mr. KENNEDY.) Is it not generally feared at the present time that all manufacturing industries will fall under the control of a few large combinations?—A. I am one of those who believe that there will be more diversification in the future than now; that the small trader will come in and buy a factory because of special aptitude in his line of business. Still I think a multiplication of large combinations will continue for the next 10 years, but even while that continues small traders will be coming in and conducting their business, and the combinations can not fight the small trader as they do companies more nearly their equals.

Q. (By Representative OTJEN.) Can they not do the way they did with the California people—lower the price and crush them out?—A. That results more from a scare than anything actually accomplished. In a staple article a man does not need to sell to the same customer every day. For instance, in former times, before I entered into the trust, I used to have 8 or 10 customers that took all the spirits and alcohol I produced; but during the last 2 years, by changing the policy of my business, as it were, I have sold to at least 150 different companies and people, changing my trade very rapidly, and getting fully as good prices as if I had continued trading with 2 or 3 men.

Q. (By Mr. JENKS.) Do you mean that you have been driven out of special markets and have gone into others?—A. That is it exactly, and to other individuals, changing my trade quite rapidly.

EFFECT OF TRUSTS UPON SMALL TOWNS AND CITIES.

Q. (By Mr. PHILLIPS.) What will be the effect of combinations of capital and concentration of industry upon the smaller cities and towns when the large cities become the centers of organization?—**A.** I think that depends more upon the question of transportation and freight rates than anything else.

Q. What effect will it have on the financial conditions of the smaller places if they do their banking business in New York, Chicago, Philadelphia, etc.?—**A.** I never could see that that was detrimental to smaller places. I live in a moderate-sized city. After I had established a credit in Chicago, I could go up there in times of disaster and bring money down to Peoria; and it seems to me to be beneficial, rather than otherwise, because the large Chicago bankers, when they have confidence in a man, extend him more credit than my bankers would dare.

Q. Do you have any idea that, in the course of a few years, when industries are more generally combined, with central offices in Chicago or New York, money will be taken there very largely and the bank accounts in smaller places diminished?—**A.** They do that now. Our company, as it was originally organized, always kept a New York account. At first they kept a large Peoria account, which seemed to be beneficial; but I doubt very much whether in the long run such changes in banking methods as you suggest will be detrimental to the smaller cities. The small city only needs enough capital to do its business with. Anything beyond that is unnecessary.

THE GENERAL EFFECTS OF TRUSTS.

Q. Upon the whole, do you think trusts detrimental or beneficial?—**A.** I think they are beneficial so far as they insure profitable returns, but they destroy the individuality of the original proprietors.

Q. And of many of the employees?—**A.** I do not know that it affects their individuality so much, but it does that of the proprietors. They disappear from view so far as their influence in the business is concerned.

Q. When a number of plants are put under one management it necessarily relieves foremen, superintendents, and traveling salesmen of a great deal of work, does it not?—**A.** It relieves some traveling salesmen, but not many foremen. I think a great majority of them are kept in employment.

Q. But are not a great many plants closed down?—**A.** That, of course, is to be expected, but it also increases other expenses; more men are employed in the offices to keep the records and look after the machinery of the large corporation. It always seems to me that it takes more high-salaried men, proportionately, to control a large corporation than a small one. I am speaking with reference to our line especially.

Q. (By Mr. KENNEDY.) Do you think that trusts have their most baneful effects upon the proprietors of the concerns that originally go into them?—**A.** So far as their individuality and personality is concerned they cease to be a factor in the business in which they were formerly a power. They lose their prestige in the business world.

Q. (By Mr. PHILLIPS.) Do they not spend most of their time cutting off coupons?—**A.** I can not say that. My observation has been that the majority of them invest in stocks, the value of which disappears.

Q. Perhaps they prefer to spend it in foreign countries?—**A.** In some lines of industry that is true. It has also been true of a great many of the original proprietors in the distilling business. A great many are growing old and wish to get out of the business. The most baneful influence that I have seen is upon the young men who would naturally succeed their fathers. They seem to have no place in the world. They wish to do something, but fear to fight the trusts. They do not wish to risk the little money they have. Eventually, I think, they will find a place—possibly in some other line. The risk for their little money seems great.

Q. (By Mr. C. J. HARRIS.) Can't they invest in trust stocks?—**A.** They have not the same faith in trust stocks that some others have; they know how much water they contain.

Q. (By Mr. JENKS.) After the formation of the Distillers and Cattle Feeders' Trust were not many of the distilleries that went in abandoned?—**A.** A great many were.

Q. There were 81 that went into the trust?—**A.** Yes.

Q. How many of the 81 were abandoned?—**A.** I should judge over 60 of them.

Q. Then did not many employees of these 60 distilleries have to look for other kinds of work?—**A.** Yes; but a great many of the 60 had not been operated for some years before, because under our system of pools we paid so much

into the treasury for the purpose of giving them time to cease operations. They had been kept quiet in that way, and a majority were dead before we organized the trust.

Q. But if they had been owned and controlled by individual distillers would they not have been running more or less all the time?—A. No; on the contrary, I think the majority of the 60 would have been wiped out of existence by competition, and would have rotted down and been sold for old junk and metal; they would have disappeared from view.

REASONS WHY THE SUPPLY OF DISTILLERIES HAS EXCEEDED THE DEMAND.

Q. (By Mr. A. L. HARRIS.) What caused the supply of distilleries to exceed the demand?—A. At different times the business has been very profitable, and that has always caused an increased number of distilleries to be built. The large exports to Europe from 1874 to 1879 was one thing in particular that caused an overproduction of distilling plants. We could not make alcohol fast enough to supply the wants of Europe. That condition was caused by the failure of the potato crop in Germany, out of which they make their alcohol. We also sold more or less in France, Italy, and Africa. It would go out in 20,000 barrel lots; that was really the cause of the organization of our first pools; when our trade suddenly stopped we had a great overproduction in distilleries; you can see at a glance why we could not make any money if all attempted to run, and consequently we adopted the pooling method.

SHOULD TRUSTS BE PLACED UNDER GOVERNMENT SUPERVISION?

Q. (By Mr. PHILLIPS.) If there is anything that has not been covered, anything that you desire to state to the commission now in your own way, we would be pleased to hear it.—A. I do not believe that I have any particular ideas on the subject other than I have expressed. I volunteered something half an hour ago that about covered my views. I might say again that I do not believe the evils of combination can be cured by legislation.

Q. Have you any remedial legislation to propose in that regard?—A. No, none whatever; but I believe it would be a good thing to take some action to prevent the watering of stock.

Q. Do you believe trusts should be put under Government supervision, similar to that of the national banks, and compelled to make a full public statement of what they are doing?—A. As a private individual, operating a factory, I should not like to have my business subjected to public criticism.

Q. Do you think it would be beneficial to the public to have some kind of an official examination?—A. I think that statements are frequently made for the purpose of influencing public opinion and manipulating the stock market. Such statements should be more carefully reviewed and the public given more accurate information. That would have a beneficial effect in regard to stock speculation.

Q. (By Mr. JENKS.) I understood you to say that you thought it had been decidedly beneficial to the distilling business to have the rigid Government supervision of distilleries that there is now, because it induced the officers of the distilleries to be more careful in their bookkeeping and methods of doing business, etc. Do you think such supervision might be beneficial in other lines of industry?—A. I think all large combinations accomplish the same result in their statistical departments that is accomplished by the Government in the records of the distilleries; and therefore you would not be accomplishing anything, except that the records kept would be made public.

Q. Are such statistics as reliable and useful as Government statistics?—A. Statistics furnished by large corporations generally show the favorable side of things. Things are generally made to look well on paper for the influence that it will have on the stock market. This is especially true in our business. The statements are always rose-colored, and the disastrous features are never made known to the public.

Q. (By Mr. PHILLIPS.) Would they be stated if there were a law requiring it?—A. I am unable to say whether or not such a law would be beneficial; it might if it were not too inquisitorial. That is what the large corporations dislike; they object to having their private affairs inquired into.

Q. If it were a condition of their charter, it would be proper and right, would it not? If they receive their charter from the State, should they not be amenable to the State?—A. Of course the law is that anything the State grants it can control or take away. Therefore, if such conditions were made when the charter was granted it might be beneficial.

AFFIDAVIT.

STATE OF ILLINOIS, *County of Peoria, ss:*

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

CHARLES C. CLARKE.

Sworn and subscribed to before me this 9th day of August, 1899.

WILLIAM S. PARRY,
Notary Public.

[SEAL.]

WASHINGTON, D. C., May 15, 1899.

TESTIMONY OF GEN. JOHN McNULTA,

Receiver of the Distilling and Cattle Feeding Company.

The commission met at 11 a. m., Monday, May 15, 1899, Vice-Chairman Phillips presiding. Gen. John McNulta, receiver of the Distilling and Cattle Feeding Company, testified.

Q. (By Mr. JENKS.) Will you be kind enough to state your full name and address?—A. John McNulta, Chicago; office in the First National Bank building

RECEIVERSHIP OF THE DISTILLING AND CATTLE FEEDING COMPANY.

Q. Will you explain to us briefly what your connection with the Distilling and Cattle Feeding Company has been, and how you came to be put in charge there?—A. I was appointed receiver of the Distilling and Cattle Feeding Company on the 4th of February, 1895, by the United States circuit court for the northern district of Illinois, northern division, in what is known as the *Olmstead case*, *Olmstead et al. v. The Distilling and Cattle Feeding Company*. I was appointed in the first instance as the special representative of the court. On the 28th of January Mr. Joseph B. Greenhut and Mr. E. F. Lawrence were appointed receivers, the former having been president of the company. A stockholders' committee intervened and applied for the removal of Mr. Greenhut upon the ground that he had been engaged in stock speculations, was short on whisky stock, and that his interests were adverse to the trust. He was removed. Mr. Lawrence, a director of the First National Bank of Chicago, was retained as the representative of the interest by which he was nominated. Mr. John J. Mitchell, president of the Illinois Trust and Savings Bank, on the nomination of another interest, was appointed receiver. I was appointed on the nomination of the court as the special representative of the court. The triple receivership continued from the 4th of February until the 23d of March, when Mr. Mitchell and Mr. Lawrence resigned. I was continued as sole receiver and am still acting in that capacity, the active business of the trust being, however, substantially closed. There are a few small properties or interests undisposed of and some claims unsettled. The active work, or the most active work, of the trust ran through a period of about 2 years and 6 or 7 months.

Q. Will you kindly tell us what your regular occupation was before?—A. I am a lawyer and have practiced my profession for 30 years or more.

HISTORY OF THE ORGANIZATION.

Q. Can you give us some detailed information with reference to the Distilling and Cattle Feeding Company; for example, its name, its date of organization, place of incorporation, place of business, etc.?—A. I have made statements, or had statements made from the books, which I have numbered and called exhibits, that I deem more reliable than my memory, and I brought them here. I wish to apologize to the commission for not coming as fully prepared on this matter as I ought. The active work of this trust has been off my hands for some time, and I have other very pressing work which keeps me very close. My hours are long and I have not been able to give the personal attention to it that I should like to have done. But I have had my secretary, who went through this work with me and is an expert and who has full knowledge of the books and accounts, aid me in the preparation of these papers. I offer you here Exhibit 1, which gives a list of the distilleries, capital stock, and other matters pertaining to the Distillers and Cattle Feeders' trust, covering substantially the ground covered by your question.

EXHIBIT 1.

No.	Houses.	Location.	Secretary.	Capital stock.	Number of shares.	Number of trustees.	Other officers.	Transfers.	Remarks.
83	Barrington Distilling Co.	Chicago, Ill.	Thos. Hutchinson	\$100,000	1,000	999	1	All right.	
1	Great Western Distilling Co.	Peoria, Ill.	J. B. Greenhut	100,000	1,000	999	1	do.	
2	Peoria Distilling Co.	do.	Wm. McLean	150,000	1,500	1,498	2	do.	
3	The Woolter Bros. Distilling Co.	do.	Samuel Woolner	350,000	3,500	3,499	2	do.	
4	Monarch Distilling Co.	do.	F. T. Corning	250,000	2,500	2,498	2	do.	
5	Messoury Distilling Co.	St. Louis, Mo.	A. Bevis	100,000	1,000	998	2	do.	
6	The Madraz & Hobart Co.	Cincinnati, Ohio	W. N. Hobart	75,000	750	748	2	do.	
7	The White Mills Distilling Co.	do.	Geo. K. Duckworth	50,000	500	499	0	do.	
8	The Storrs Distilling Co.	Chicago, Ill.	O. L. Perin	50,000	500	499	0	do.	
9	The Miller Distilling Co.	Hamilton, Ohio	Geo. L. Miller	100,000	1,000	998	1	do.	
10	The Hamilton Distilling Co.	Chicago, Ill.	R. W. Caldwell	150,000	1,500	1,498	2	do.	
11	The Phoenix Distilling Co.	Cincinnati, Ohio	Geo. T. Burroughs	50,000	500	498	2	do.	
12	The Orange Valley Distilling Co.	Peoria, Ill.	B. F. Walsh	100,000	1,000	998	2	do.	
13	Manhattan Distilling Co.	do.	S. F. Clarke	150,000	1,500	1,490	2	do.	
14	Northern Distilling Co.	St. Louis, Mo.	H. Schwabacher	100,000	1,000	998	10	do.	A. Woolner transfer certificate No. 6. Should be signed by L. H. Greene.
15	Tennessee Distilling Co.	Chicago, Ill.	L. Tenschler	100,000	1,000	999	1	All right.	
16	P. H. Rice Distilling Co.	St. Louis, Mo.	T. J. Rice	200,000	2,000	1,998	2	do.	
17	Bremen Distilling Co.	St. Louis, Mo.	A. Sessinghaus	70,000	700	699	1	do.	
18	The Roselle Distilling Co.	Lawrenceburg, Ind.	D. F. Walsh	100,000	2,000	1,998	2	do.	Certificate No. 8, J. B. G.
19	Rock Springs Distilling Co.	St. Louis, Mo.	Z. W. Tinker	40,000	400	399	1	All right.	Certificate No. 16. Body says 111; should be 110.
20	The Mayflower Distilling Co.	Cincinnati, Ohio	Geo. F. Dieterle	100,000	1,000	998	2	do.	
21	The Robeson & Stegeman Distilling Co.	Newport, Ky.	J. H. Stegeman	75,000	750	748	2	All right.	
22	Martin Distilling Co.	Kansas City, Mo.	John W. Speas	200,000	2,000	1,998	2	do.	
23	Independence Distilling Co.	Independence, Mo.	do.	25,000	250	248	2	do.	
24	The Brighton Distilling Co.	Cincinnati, Ohio	M. S. Hoffheimer	100,000	1,000	998	2	do.	
25	Clarke Bros. Distilling Co.	Peoria, Ill.	Chauncey D. Clarke	100,000	1,000	998	1	do.	Chauncey D. Clarke, secretary, has no certificate of stock in name of Chas. C. Clarke.
26	The Dorsal & Wulfsberg Distilling Co.	Covington, Ky.	F. Wulfsberg	50,000	500	499	1	All right.	
27	The Covington Distilling Co.	do.	G. Holbrook	25,000	250	249	1	do.	
28	The Eagle Mills Distilling Co.	Peoria, Ill.	John D. Bush	150,000	1,500	1,498	2	do.	
29	The Eagle Mills Distilling Co.	Indianapolis, Ind.	John F. Pfeffer	100,000	1,000	999	2	do.	
30	Standard Distilling Co.	Peoria, Ill.	Oscar Furst	75,000	750	749	1	do.	
31	John S. Miller Distilling Co.	Sterling, Ill.	W. H. Miller	10,000	100	99	1	do.	
32	Canton Incorporated Distillery	Canton, Ill.	Jno. G. Harstein	50,000	500	499	1	do.	
33	Meiners Distilling Co.	Milwaukee, Wis.	G. Meiners	75,000	75	74	1	do.	
34	Pleasant Valley Distilling Co.	do.	Jno. W. O'Neill	50,000	500	499	1	do.	
35	The Beach Creek Distilling Co.	Foster, Ohio	John A. Parks	25,000	250	248	2	do.	
36	Krusse Bros. Distilling Co.	Peoria, Ill.	F. G. Kruse	40,000	400	398	2	do.	
37	The Hogan Valley Distillery	Aurora, Ind.	H. W. Smith	300,000	6,000	5,998	2	do.	

EXHIBIT 1—Continued.

No.	Houses.	Location.	Secretary.	Capital stock.	Number of shares.	Number of trustees.	Other officers.	Transfers.	Remarks.
39	Wabash Distilling Co.	Terre Haute, Ind.	John Beggs	\$200,000	4,000	3,998	2	All right.	Trustees hold 3 shares instead of 1.
40	The Shelby Distillery Co.	Shelbyville, Ind.	John E. Beggs	30,000	600	598	2	do.	
41	Willow Springs Distilling Co.	Omaha, Nebr.	H. Suesenbach	250,000	2,500	2,498	2	do.	
42	The Nebraska Distilling Co.	Nebraska City, Nebr.	George L. Woolsey	100,000	1,000	998	2	do.	Certificate does not state amount of capital stock.
43	The Crown Distilling Co.	Pekin, Ill.	H. P. Westerman	65,000	650	649	1	do.

49	Beaver Valley Distilling Co.	Trebelna, Ohio	Wm. N. Silver	15,000	150	148	2	do.	
50	Great Eastern Distilling Co.	Peoria, Ill.	M. Farrelly	75,000	750	748	2	do.	
51	Pfeiffer Distilling Co.	Lebanon, Ill.	C. J. Pfeiffer	100,000	1,000	999	1	do.	Do.
52	The Dair Distilling Co.	W. Harrison, Ind.	Chas. E. Dair	50,000	500	499	1	do.	
53	The Licking Distilling Co.	Covington, Ky.	Louis Block	10,000	100	99	1	do.	
54	National Distilling Co.	Chicago, Ill.	Chas. Powell	100,000	1,000	999	1	do.	Certificate does not state capital stock, par value, etc.
55	The Barker Distilling Co.	Peoria, Ill.	W. C. Foster	135,000	1,350	1,348	2	do.	
56	The Hamburg Distilling Co.	Peoria, Ill.	E. W. Wilson	50,000	1,000	998	2	do.	
57	The Antique Distilling Co.	Midvale, Ky.	Chas. L. Mills	50,000	500	499	1	do.	Certificate No. 9 made out to W. N. Corning.
58	The Shamrock Distilling Co.	Higginsport, Ohio	Wm. Duffey	25,000	250	248	2	do.	
59	The Riverton Alcohol Works	Riverton, Ill.	H. B. Miller	30,000	300	299	1	do.	
60	The Maddox Distilling Co.	Dayton, Ky.	L. O. Maddox	48,000	480	479	1	do.	Certificate No. 9 made out to W. N. Corning.
61	Enterprises Distilling Co.	Pekin, Ill.	P. W. Dunne	75,000	750	749	1	do.	
62	The Davis Distilling Co.	Portsmouth, Ohio	P. W. Dunne	25,000	250	248	2	do.	
63	The Fairmount Distilling Co.	Cincinnati, Ohio		27,000	54	54	0	do.	Certificate No. 9 made out to W. N. Corning.
64	The Dayton Distilling Co.	Dayton, Ohio	L. Herancourt	10,000	100	99	1	do.	
65	The Carroll Distilling Co.	Wide Awake, Ky.	E. J. Mack	100,000	1,000	998	2	do.	

This exhibit contains the names of all the different houses in the company, 65 of them the location of each, the name of the secretary of each, the capital stock and number of shares of each, the number of shares held by the trustees and by the other officers, the nature of the transfers, and some remarks with reference to a few of the facts presented there.

Q. Has the general statement in this exhibit ever been printed?—A. I think not. The date of the organization of the Distilling and Cattle Feeding Company was February 11, 1890. The transfer of the properties was made, on the books of the Distilling and Cattle Feeding Company, on April 1, 1890.

Q. What was the nature of the product manufactured by this organization?—A. The product was spirits and alcohol, with small quantities of gin and whisky and blended goods generally, such as are put up by the distributing house of H. H. Shufeldt & Co. of Chicago. The refuse was used for cattle-feeding purposes.

Q. These minor products, then, were practically all manufactured at the Shufeldt distillery?—A. Practically all of them. Now and then, at the close of the distilling season, they ran off some whisky.

THE STOCKS OF THE COMPANY.

Q. Can you give us the details with reference to the amount of stock authorized and the amount issued, common and preferred?—A. Common stock to the amount of \$35,000,000 was authorized, and the full amount was eventually issued. There was no preferred stock authorized or issued; and there being no preferred stock, there were no dividends or profits of any kind on the same. The treasury stock was eventually all issued. There was nothing in the by-laws covering the issue or use of treasury stock. The total amount of bonds authorized was \$8,000,000. One million was issued, and I believe that, at a later day, the authority to issue the balance was revoked; \$2,500,000 of them, however, were put up as collateral for the repayment of money held on rebates. There were no bonds paid off. The total amount of bonds outstanding at the date of the receivership was \$1,000,000, with \$2,500,000 held by the trustees as collateral for rebates. The bonds were issued in the spring or summer of 1893. My recollection is that they were 20-year bonds. The rate of interest was 6 per cent. Four hundred thousand dollars of these bonds were issued to take up \$200,000 of indebtedness, as I recollect it; i. e., \$400,000 of the bonds were issued for \$200,000 in cash, through brokers. Two hundred thousand dollars in bonds were issued for \$100,000 in cash to certain officers of the company. There were none of these bonds issued in exchange for property. Perhaps my statements in regard to Exhibit 1 have been misleading to you.

THE DISTILLERS AND CATTLE FEEDERS' TRUST.

Exhibit 1 gives a list of 65 distilleries, which I believe went in, or were the first 65 houses that went in, to form the Distillers and Cattle Feeders' Trust, and not the Distilling and Cattle Feeding Company. The Distilling and Cattle Feeding Company having bought outright the properties and interests of the Distillers and Cattle Feeders' Trust, and all records of the Distillers and Cattle Feeders' Trust having been destroyed, it is impossible to give any better information than that contained in Exhibit 1.

Q. Was anything at all brought out in court or elsewhere as to why the books of the Distillers and Cattle Feeders' Trust were destroyed; who destroyed them, etc.?—A. I made diligent inquiry upon that subject and demanded the papers from the officers of the old company, but with no satisfactory results. The general response was that they were lost, destroyed, not in existence, etc. I never succeeded in getting them. When I took possession of the office at Peoria, with all the papers of the Distilling and Cattle Feeding Company, the trust papers were not there, and could not be found. So far as I am aware they never have been found, and I am satisfied they are destroyed.

Q. Did you find the papers of the Distilling and Cattle Feeding Company apparently intact?—A. Yes; apparently intact, but they had been separated. There was some little controversy between the receiver and the officers of the company as to which were the papers of the company and which were the private papers of the individuals. It ended in a dispute about 2 safes which were in the office and which were locked. It was insisted by certain of the officers of the company that they contained only private papers. But the safes were the property of the company, and I proposed to investigate. We got into something of a rumpus. They refused to open them; and I was compelled to get some locksmiths, who cut one safe open, and prepared to blow the other one open with dynamite, but before it was found necessary to do that an expert from

Chicago succeeded in opening it. In that safe we found a number of papers which we decided belonged to the Distilling and Cattle Feeding Company, and kept them and used them.

Q. Were the others turned over to the individual officers to whom they belonged?—A. Their private papers were separated and turned over to them. There were 3 expert accountants appointed—that is, during the triple receivership, 1 nominated by each of the receivers appointed by the court to operate under the direction of the receivers. They operated during the triple receivership, and under my direction during the sole receivership. One of these experts prepared these papers which I present to you to-day. He has had control of the papers, but the trust papers were not found, and could not be found. The stocks of these various distilleries were not listed, and there is no way of arriving at their market value at the time they entered into the trust or into the Distilling and Cattle Feeding Company. Exhibit 2 gives a list of the distilleries that were finally included in the trust, which exceeds the number in the original statement by 20. There is a column giving the date of entering the trust, by which is meant the date on which the distillery was taken into the trust. Under the head of "Distillery" is the name of the corporation. Under the head of "Location" is given the name of the town in which located. "R" shows that the house was a running house. "Not R" means that the house was not running, and "Shares" shows the number of shares in the Distillers and Cattle Feeders' Trust that were issued for the property.

EXHIBIT 2.—Name and locality of distilleries running and not running at time of transfer to Distilling and Cattle Feeding Trust.

No.	Date of entering trust.	Distillery.	Location.	Running.	Shares.
1	Feb. 2, 1888	Antique Distilling Co.	Kenton County, Ky.	No	1,870
2		Atlantic Alcohol Works	Atlantic, Iowa	No	846
3	Jan. 12, 1888	Brighton Distilling Co.	Cincinnati, Ohio	Yes	4,845
4	Nov. 14, 1887	Beach Creek Distilling Co.	Dayton, Ohio	No	248
5	Dec. 15, 1887	Beaver Valley Distilling Co.	Trebeins, Ohio	No	2,087
6	Jan. 23, 1888	Barker Distilling Co.	Peoria, Ill.	Yes	2,245
7	Oct. 3, 1887	Bush & Brown Distilling Co.	do	Yes	3,220
8		Bay View Distilling Co.	San Francisco, Cal.	No	
9	Aug. 16, 1887	Bremen Distilling Co.	St. Louis, Mo.	No	1,436
10	July 18, 1887	Birmingham Distilling Co.	Chicago, Ill.	Yes	9,248
11	Dec. 27, 1887	Cummingsville Distilling Co.	Cummingsville, Ohio	No	400
12	Sept. 20, 1887	Clarke Bros. Distilling Co.	Peoria, Ill.	Yes	3,687
13	Dec. 13, 1887	Crown Distilling Co.	Pekin, Ill.	No	2,250
14	Feb. 22, 1888	Carroll Distilling Co.	Wide Awake, Ky.	Yes	1,580
15	Sept. 22, 1887	Covington Distilling Co.	Covington, Ky.	No	808
16	Nov. 2, 1887	Canton Distilling Co.	Canton, Ill.	No	352
17		Comanche Alcohol Works	Comanche, Iowa	No	350
18	Feb. 23, 1888	Dayton Distilling Co.	Dayton, Ky.	No	
19	Jan. 28, 1888	Davis Distilling Co.	Portsmouth, Ohio	No	1,380
20	Jan. 2, 1888	Dair Distilling Co.	Harrison, Ind.	No	600
21		Dorsel & Wulfstange	Covington, Ky.	No	1,250
22	Oct. 18, 1887	Eagle Mills Distilling Co.	Indianapolis, Ind.	No	725
23	Mar. 6, 1888	Enterprise Distilling Co.	Pekin, Ill.	No	2,090
24	Feb. 28, 1888	Fairmount Distilling Co.	Cincinnati, Ohio	No	
25	Jan. 2, 1888	Farrington Distilling Co.	Piqua, Ohio	No	
26	Dec. 1, 1887	Fayette Distilling Co.	Albany, N. Y.	No	1,325
27		Firmenich	Peoria, Ill.	No	
28	Dec. 31, 1887	Great Eastern Distilling Co.	do	Yes	3,078
29	July 22, 1887	Great Western Distilling Co.	do	Yes	21,437
30	Aug. 3, 1887	Hamilton Distilling Co.	Hamilton, Ohio	Yes	5,887
31	Nov. 20, 1887	Hogan Valley Distilling Co.	Aurora, Ind.	No	2,808
32		International	Des Moines, Iowa	No	5,000
33	Aug. 1, 1887	Independence Distilling Co.	Independence, Mo.	No	
34		Iowa Alcohol Works	Iowa City, Iowa	No	407
35	Oct. 28, 1887	J. S. Miller	Sterling, Ill.	No	1,203
36	Jan. 23, 1888	J. W. Johnson	Peoria, Ill.	No	
37	Nov. 30, 1887	Kruse Bros. Distilling Co.	Wesley City, Ill.	No	265
38		Kuhlman & Teepen	Brocklyn, Ind.	No	
39	Dec. 28, 1887	Lacking Distilling Co.	Covington, Ky.	No	850
40	July 22, 1887	Maddux & Robert Distilling Co.	Cincinnati, Ohio	Yes	6,308
41	Aug. 24, 1887	Mayflower Distilling Co.	do	Yes	2,744
42	Aug. 15, 1887	Manhattan Distilling Co.	Peoria, Ill.	Yes	6,955
43	July 22, 1887	Monarch Distilling Co.	do	Yes	22,847
44	Nov. 4, 1887	Melners Distilling Co.	Milwaukee, Wis.	No	1,374
45	Feb. 18, 1888	Maddux Distilling Co.	Dayton, Ky.	No	2,700
46	Sept. 10, 1888	Martin Distilling Co.	Kansas City, Mo.	Yes	3,743
47	July 14, 1887	Missouri Distilling Co.	St. Louis, Mo.	Yes	8,408
48	Aug. 6, 1887	Miller Distilling Co.	Chicago, Ill.	Yes	4,025
49		W. H. McCormick	Beardstown, Ill.	No	180
50	Aug. 18, 1887	Northern Distilling Co.	Peoria, Ill.	Yes	8,517
51	Jan. 1, 1888	National Distilling Co.	Milwaukee, Wis.	No	1,600

EXHIBIT 2.—Name and locality of distilleries running and not running at time of transfer to Distilling and Cattle Feeding Trust—Continued.

No.	Date of entering trust.	Distillery.	Location.	Running	Shares.
52		Northwestern	Chicago, Ill.	No	1,000
53		Nebraska City Distilling Co.	Nebraska City, Nebr.	Yes	2,857
54	Aug. 8, 1887	Orange Valley Distilling Co.	Cincinnati, Ohio	Yes	4,075
55	Dec. 11, 1889	Ohio Distilling Co.	Lynchburg, Ohio	Yes	-----
56	Dec. 9, 1887	Patriot Distilling Co.	Patriot, Ind.	No	481

80	July 18, 1887	White Mills Distilling Co.	Cincinnati, Ohio	No	6,726
81	Dec. 6, 1887	Wabash Distilling Co.	Terre Haute, Ind.	Yes	9,814
82	July 23, 1887	Woolner Distilling Co., No. 8	Peoria, Ill.	Yes	23,003
83	do	Woolner Distilling Co., No. 7	do	No	3,882
84	Dec. 8, 1887	Willow Springs Distilling Co.	Omaha, Nebr.	Yes	6,027
85	Jan. 24, 1888	Hamburg Distilling Co.	Pekin, Ill.	Yes	2,690
86	Aug. 19, 1887	P. H. Rice	Chicago, Ill.	Yes	4,225

Q. Did you find out the basis upon which the trust certificates were issued to the proprietors of the distilleries?—A. No; I reached no reliable data on that point except what is shown here in the papers.

ADDITIONAL DISTILLERIES PURCHASED.

In addition to the distilleries on this list, which were, at the time of the formation of the Distilling and Cattle Feeding Company, a part of the Distillers and Cattle Feeders' Trust, the Distilling and Cattle Feeding Company purchased the Riverdale Distillery, Riverdale, Cook County, Ill.; the Calumet Distillery, on the Calumet River, Cook County, Ill.; the H. H. Shufeldt Distillery, Chicago, Ill.; the Star and Crescent Distilleries, at Pekin, Ill.; the Central Distilleries, in St. Louis, Mo., and the Nebraska City Distillery, Nebraska City, Nebr. This Nebraska City Distillery was a part of the trust, and was sold by the trust, or the Distilling and Cattle Feeding Company, for \$10,000, with a guaranty that it would not be used for distilling purposes. Two or three years later the Distilling and Cattle Feeding Company bought it from the purchaser for \$410,000.

Q. Do you mean that it was sold in the first place by the company for \$10,000, and afterwards repurchased for \$410,000?

Q. (By Mr. PHILLIPS.) Were any improvements put on it?—A. Not any considerable improvements.

Q. (By Mr. JENKS.) Was there any other reason why it was sold at so low a rate and repurchased at a higher rate?—A. Not that I know of, except the matter of control.

Q. What do you mean by the matter of control?—A. The control of the output.

Q. Was the sale made to persons not connected with the trust?—A. It was sold to outsiders who agreed to eliminate it from the market, but they violated their agreement and the company bought it back again to eliminate it. It was bought back in connection with 3 other distilleries—the Central Distillery, of St. Louis, and the Star and Crescent Distilleries, of Pekin, Ill. In connection with this transaction there was a debt, or difference, as claimed by me in my effort to collect from the business of the company, of about \$290,000. That is, one individual who was an officer of the company went to the individual owners of these distilleries and made a purchase, or contract of purchase, and then sold the distilleries to the

Distilling and Cattle Feeding Company. The difference between what he bought them for from the owners and what he sold them for to the Distilling and Cattle Feeding Company was about \$290,000.

Q. Was this individual an officer of the company?—A. He was an officer at one time. That, among other things, constituted the basis of a bill filed by me against a number of individuals, including the officers of the company, to recover \$800,000. The other causes grew out of the use of the funds of the company in stock speculations in New York.

USE OF THE FUNDS OF THE COMPANY IN STOCK SPECULATIONS.

Q. (By Mr. JENKS.) Can you give some of the details with reference to the use of the funds of the company by the officers in stock speculations?—A. In order to go into the details accurately it would be necessary to have the books and figures before me. In a general way, I set up in the bill that they had used the funds of the company in buying and selling stock and had lost a very large amount of the company's money. I do not remember the exact amount.

Q. That is, they had used the funds of the company to buy stocks for themselves and to protect margins for themselves?—A. Nominally, I think, for the company.

Q. Nominally for the company?—A. Yes. But the theory proceeded upon was that they were buying stocks for the company and selling stocks as individuals. As individuals they were getting a good market; as officers, a very bad one. We have never come to a final hearing on that bill, therefore I can not tell what would have been the judicial results; but the difference from the standpoint that I made was about \$800,000 to the trust.

It is impossible to give the cost of building and equipping the plants. The only houses that were purchased for money were the Riverdale, for which about \$300,000 was paid; the Calumet, for which about \$500,000 was paid; the H. H. Shufeldt, for which about \$1,600,000 was paid; the Star and Crescent, for which about \$700,000 was paid; the Central Distillery, of St. Louis, for which about \$850,000 was paid, and the Nebraska City Distillery, for which about \$425,000 was paid. I notice a difference between this statement of the amount paid for the Nebraska City Distillery and the one I have already made. The difference, I take it, is in the cost.

Q. These are the ones paid for in cash?—A. Yes; in cash.

PLAN OF ORGANIZATION OF THE DISTILLERS AND CATTLE FEEDERS' TRUST.

Q. Is that all on that point?—A. Yes. In Exhibit 3, which I present here, I give the plan of organization of the Distillers and Cattle Feeders' Trust, which is as full an account of this organization as we were able to dig out in Peoria in 1895, at the time of the examination of the accounts of the Distilling and Cattle Feeding Company:

EXHIBIT 3.—*Distillers and Cattle Feeders' Trust agreement, dated May 10, 1887.*

1. The trust herein created is to be vested in nine trustees.
2. W. M. Hobart, Geo. K. Duckworth, L. H. Green, P. J. Hennessy, Alfred Bevis, Joseph B. Greenhut, W. H. Corning, Adolph Woolner, and J. H. Francis were appointed trustees, to hold their office until May 1, 1888, or until their successors are elected.
3. The trustees shall prepare certificates showing the interests of each beneficiary in said trust, said certificates to be divided into shares of the par value of \$100 each.
4. No certificates shall be issued except for stock as hereinafter provided, and the par value of the certificates issued shall represent, as nearly as possible, the actual cash value of the stock held by the trustees in trust.
